FOREWORD

by

Morris Janowitz, Professor of Sociology, University of Chicago,
and Chairman, Inter-University Seminar on Armed Forces and Society

Armies are universal institutions. There are no nation States playing a role in world politics in which the political leaders have deliberately taken the decision not to maintain an army. The military, and especially the ground forces, reflect the supremacy and the resulting dilemmas of nationalism in the modern historical period. In fact, to speak of a nation State means to designate the scope and corporate form of its army.

It is self-evident that the continued development of armies is not simply the result of industrial and economic development or of the mere accumulation of past aspirations, accomplishments and failures of the armed forces. Among the plethora of new nations which came into being with the decline of Western imperialism after World War II, there was not a single case of a ruling group which did not explicitly — and very often energetically — organise an army. The push to create these armies has in many cases led to the downfall of these ruling groups or political leaders.

In the contemporary period, the universality of armies is dramatised by the common and uniform terminology for describing the military enterprise; the term 'the military balance', for example, has come to have a world-wide currency. It is a language which strives for precision but which is not without its 'reification' of military reality. The idea of the 'military balance' rests on the accumulation of statistical measures and indicators which are designed to be summed into an estimate of politico-military potentials. These measures encompass the men (and the women) under arms classified into the variety of categories which reflect their military status. It includes the number and types of weapons; and wherever possible this information is translated into monetary units. These sums emerge as an essential aspect of the self-conceptions of the military profession in a technological age. These data become basic elements in the imagery and rhetoric with which political leaders think about the world community. The military balance protrudes continuously into the mass media and into popular discourse about war, peace and the hope for conflict resolution.

But armies are historical, social and political institutions. Statistical indicators remain partial, and subject to distortion; they must be supplemented by a concern with organisational forms. Armies are institutions which have some common characteristics because they are organised to make use of military technology and to apply a logic of making war and deterring war. But each army has its own special characteristics which flow from its operational history, its cultural setting and its political attachments. John Keegan's *World Armies* is a world-wide survey of armies as human bureaucracies; the emphasis is on the special and particular features of each army. The idea of a world-wide survey in the institutional *genre* is truly attractive. The book represents an immense amount of work by the editor and his collaborators and the result enriches our understanding of the armies of the world, giving succinct presentations without loss of essential detail. The end result is a series of institutional portraits which give a clearer but more complex meaning to the military balance and which offer a fuller understanding of the political meaning of armies as they actually exist and continue to evolve.

Chicago, 1979

EDITOR'S PREFACE

The origins of this book are easily explained. In 1972 Dr John Paxton asked me to assist him with the army entries in the long-established *Statesman's Year-Book* which he edits for The Macmillan Press. I readily agreed. But, while I found those for the older and larger countries fairly easy to complete, information about the armies of the newer and smaller countries proved hard to uncover. I tried a variety of sources and, as disappointment grew at the paucity of the material they yielded, came to feel that I was failing to find a book which obviously existed but must be hiding itself from me — a comprehensive guide to the armies of the world. Once the idea of such a book was fully formed in my mind, a little reflection told me that no such thing was published in English. Enquiry revealed that there was nothing similar in French, German, or any language that I could read. And I was ultimately convinced that no such thing was published anywhere.

It was a short step for John Paxton to suggest to The Macmillan Press that I should undertake the preparation of such a work and to their agreeing to it. Our reasons coincided: that armies, far from losing their importance as the rise of air power and the development of nuclear weapons had seemed earlier in the century to suggest they would, were now among the most significant institutions in many countries in the world, even if that significance was to be measured in political rather than strictly military terms. In mainland Latin America, a majority of the States were under direct military rule, as was also the case over wide areas of Africa and Asia. In many other countries the army, if not ruling directly, was the unchallenged arbiter of who should rule, on what terms and for how long. And in others still, a guarantee of the army's support was the first assurance sought by any government in time of crisis. Nor were such countries always necessarily among the young nations. It may be remembered that President de Gaulle, on his hasty return from Romania to face the *événements* of May, 1968, made the headquarters of the First French Army his first port of call. Finally, in the communist world, army and party typically formed a single and indissoluble apparatus of power, through which mutual suspicion and interest were more or less smoothly worked out, at the expense of all other groups in society.

This worldwide rise of armies to political and social prominence should surprise no realistic observer of the contemporary scene. For, in the words of Professor S.E. Finer, 'at first sight the political advantages of the army *vis-à-vis* other and civilian groupings are overwhelming. It possesses vastly superior organisation. And it possesses *arms*. The wonder, therefore, is not why it rebels against its civilian masters, but why it ever obeys them.' That question, of which Professor Finer is a leading analyst, has come to be treated as one of the greatest importance by modern political scientists who have, under the title of 'civil-military relations', accorded independent status to the enquiry as a major sub-division of their discipline. Professor Finer's particular contribution to it has been to investigate the motives and circumstances disposing armies to intervene in politics and to suggest a theoretical framework of 'levels' of intervention — progressively 'influence', 'pressure', 'displacement' and 'supplantment'. Displacement and supplantment characterise military politics in the countries of what Professor Finer calls 'lower political culture'. In developed political cultures it is the minor levels of intervention — pressure and the perfectly legitimate exercise of influence — to which armies resort. And what political scientists must seek to explain there is why armies in general confine themselves to such comparatively restrained uses of their power. Those who have sought to do so are chiefly Americans, and notably Professors Samuel Huntington and Morris Janowitz (the latter has generously contributed a Foreword to this book). To the former we owe the idea of the rise of 'professionalism' in modern armies, a concept he employs to demonstrate how the leaders of armies in the Western world have been progressively integrated into the educated middle class and persuaded to adopt its outlook, manners and responsibilities. To Professor Janowitz we owe the first detailed sociological profile of a 'professionalised' military group, as well as an interesting theory of how such a military sub-culture may be expected to evolve in the future.

The work of these scholars — and of their European *confrères*, notably Demeter in Germany and Girardet in France — has transformed over the last 30 years our whole understanding of military societies. But it is nevertheless possible still to feel that a great deal remains to be done for the study of armies. Their work, largely undertaken in universities, has necessarily been done at some distance from the military institutions on which it concentrates. It has tended as a result to represent armies as monolithic in structure and likely to reveal an internal texture as uniform as their outward appearance. Those who work near or within armies are rapidly made aware, however, of how deceptive this apparent uniformity is, and of the extent to which an army may reproduce within itself the social and cultural divisions, regional patriotisms, sub-group ('regimental') loyalties, personal followings and similar fragmentations which compartmentalise large and powerful organisations everywhere. An intimate knowledge of one army, moreover, quickly provides clues to the discovery of internal divisions peculiar to others and thereby to a pattern of differences between armies in general. These differences are an inconvenience to political scientists, for whom 'army', like 'civil service', 'judiciary' or 'police', is a useful piece of political shorthand which may be made to stand as a term of fixed value in many of their commoner equations. It is, for example, generally taken to mean 'the sole bearer of arms within the State'. In many countries, however, the army is only

one of two or more armed bodies under State control, and less important for internal political purposes than the armed police or workers' militia. It is generally taken to mean 'the automatic guarantor of the State's authority'; but in many countries the army is disqualified or exempts itself from involvement in the internal affairs of the State. It is generally taken to mean 'the embodiment of the popular will to defend the national territory'; but in a number of countries anti-militarist feeling is so strong that the army's military role is scarcely more than symbolic. The catalogue of ways in which any particular army may be shown to diverge from the hazily defined and loosely used concept of 'the army' might be continued for some time.

The principal aim of this book therefore is to provide a portrait of each army in its domestic context, historical, social and political as well as military. Each main entry is arranged in a standard form, containing nine headings: History and Introduction; Strength and Budget; Command and Constitutional Status; Role, Commitment, Deployment and Recent Operations; Organisation (Arms of Service and Operational); Recruitment, Training and Reserves; Equipment and Arms Industry; Rank, Dress and Distinctions; and Current Developments. The hope is that through this scheme of treatment a picture of each army will emerge revealing not only its military capability — how and where recruited, how armed and by whom, where stationed, to what alliances committed, in what operations most recently engaged and how successfully — but also its relationship to the government and administration of the State to which it belongs; its kinship with the population; its affinities with, or antipathies to, significant groups within society; its role in the national historical experience and its own particular cultural and social character.

Because the editorial emphasis lies on the domestic rather than the international status of each army, entries may sometimes seem longer than the military worth of a particular army might be thought to justify. Thus an army like the Argentinian (which has fought no war for a hundred years) receives as much space as the British, which is not only larger but has been almost continuously in action, abroad or in the empire, for over a century. The latter, however, plays no appreciable political role in national affairs, while the activities of the former have been of paramount importance. In many cases, however, both the length and quality of entries has been affected by the paucity of trustworthy information available to the contributors. Reliable information was most easily obtained in the case of the armies of the democracies, and then in those of the communist States, which are closely studied by Western observers even if they publish little about themselves. It was least easily acquired in the case of the small, new States where the armies, though often of little military worth, are crucial institutions and therefore both anxious and able to censor news about their shortcomings. The editor and contributors are keenly aware of the consequent gaps and obscurities in this, the first edition of *World Armies*, but are confident that the fact of its publication will generate the flow of information necessary to equalise the quality of all entries in subsequent years.

They have nevertheless received a great deal of assistance from many quarters, for which they acknowledge their gratitude. The editor would in particular like to thank the International Institute for Strategic Studies, and its Deputy Director, Colonel Jonathan Alford, for permission to draw freely on its *Military Balance* wherever appropriate. Those familiar with that indispensable publication will recognise whenever material has been taken from it; it provides in particular most of the information in the Strength and Budget section of the entries. He would also like to thank the following members of The Macmillan Press staff: Adrian Soar, for his enthusiastic response to the original idea of the book and for guidance during the planning stage; Jessica Orebi Gann, for constant editorial support; Richard Powell, for enlightened as well as painstaking copy-editing of the typescript; and Shaie Selzer, for supervising the book through its final editorial and production stages. His thanks go also to the contributors, with whom it has been a consistent pleasure to work; despite the length of time taken in compilation, a happy spirit of co-operation has prevailed between all. He would finally also like to thank his wife, whose natural interests are not in military things but who has given constant encouragement and advice, all of which was deeply valued.

Camberley, 1979

J.K.

A NOTE ON ABBREVIATIONS

It was the intention to exclude all abbreviations from the text, since it is meant to be as useful to the non-specialist as to the specialist. A few abbreviations have nevertheless crept in, while others have in practice come to look preferable to the cumbersome phrases for which they stand (cf. APC and Armoured Personnel Carrier). These are the most frequent occurrences:

AAM	air-to-air missile
AFV	armoured fighting vehicle
APC	armoured personnel carrier
ATGW	anti-tank guided weapon
COIN	counter-insurgency (aircraft)
CPB	coastal patrol boat

FB	fighter–bomber
FGA	fighter–ground attack
FPB	fast patrol boat
FPBG	fast patrol boat with guided missiles
LST	landing ship, tank
LCT	landing craft, tank
MICV	mechanised infantry combat vehicle
MTB	motor torpedo boat
RCL	recoilless (rifle)
RL	rocket launcher
SAM	surface-to-air missile
SP	self propelled (gun or howitzer)
SPG	self propelled gun
SSM	surface-to-surface missile
TOW	tube-launched, optically-sighted, wire-guided anti-tank missile

A NOTE ON UNITS AND FORMATIONS

Military specialists distinguish between a military *unit*, in which only one arm of service (e.g. infantry, artillery) is represented, and a *formation*, in which two or more are represented. Almost without exception, formations are larger than units, from a mixture of which they are composed.

Units

Section (or Squad): 6–10 men; about three sections to a : —

Platoon: 30–40 men; about three platoons to a : —

Company: 150–250 men; about three companies to a battalion (see below)

(Battery: the equivalent of an infantry company in the artillery)

(Squadron: the equivalent of an infantry company in the cavalry or armoured branch)

Battalion: 750–1000 men

Regiment: (a) a unit of several battalions; (b) a battalion of artillery, cavalry or armour

Formations

Brigade: three or more battalions, with attached support and service units; about 5000 men; if armoured, about 100 tanks

Division: two or more brigades, with its own artillery, support and service units; 10,000–17,000 men; if armoured, 150–300 tanks

Corps: two or more divisions

Army: two or more corps

Army Group: two or more armies (known as a *Front* in the Soviet army)

Sections are commanded by corporals or sergeants; platoons by sergeants or lieutenants; companies (batteries, squadrons) by captains or majors; battalions by lieutenant-colonels; brigades by brigadiers or colonels; divisions by major-generals; and corps by lieutenant-generals.

INTRODUCTION

by

Professor Michael Howard, CBE, MC, FBA,
Chichele Professor of the History of War, University of Oxford

A book on the world's armies published before 1914 would have been strikingly different from this one. In the first place, instead of listing well over 140 countries, it would have comprised perhaps a couple of dozen: the States of Europe (including the new, militant nations of the Balkans); the USA; Turkey; Japan; and perhaps Latin America. Secondly, much of its interest would still have attached to the splendour of the uniforms it depicted; soldiers were still reluctant to believe that their capacity to survive, let alone fight, in war depended on their being as indistinguishable as possible from the mud and dust of the battlefield. Thirdly, the weapons depicted would have been comparatively simple. Cavalry was armed with lance, sabre and carbine, infantry with rifle and bayonet, artillery with standard field or heavy pieces. In the supporting arms, indeed, twentieth-century technology was beginning to make its mark. Bicycle and field-telegraph detachments would have been listed, and observation-balloon units were beginning to experiment with primitive aircraft. But all this was marginal. Finally, with the possible exception of Latin America, there would have been no question about the function of these armies. It was to fight one another, in a great war that was universally expected and would be likely to involve them all.

If it did nothing else, the present volume would show how completely the world has been transformed by World Wars I and II. The old European armies, where they survive at all, are swamped by those of the States which have arisen on the ruins of their empires, and are dwarfed by those of the two superpowers (though the giant military potential of the Russian Empire was there even in 1914 for those who had eyes to see). Brilliant uniform has ceased to be a feature of any serious army. All dress as simply and inconspicuously as possible, and the *machismo* which once found expression in military elegance now attaches to the weapons with which the forces are armed, and a ruggedness emphasised by the very casualness of dress. The weapons of even the smallest of armies, though often easy enough to operate, are of a complexity of construction such as only the most advanced technological societies can produce. An interesting exercise would be to go through the entries in this book and see from what a small number of suppliers all this military hardware actually derives.

Finally, and perhaps most interestingly of all, is the question of the role of these armies; why they exist at all, and what enemy they expect to fight. In some cases, such as the Israeli army, the answer is only too obvious. For others — say that of New Zealand — a certain political sophistication is needed to discern a role at all. For some — Iran/Iraq, India/Pakistan — there are significant regional rivalries. For those of the USSR, the USA and their European allies, there is the great central confrontation. For China there is the looming presence of the Soviet Union, for Vietnam the looming presence of China, for Thailand, perhaps, the looming presence of Vietnam.

But the great majority of the armies here listed do not owe their existence to any particular military threat. In European nations like Britain and France they are historic institutions as old as the community itself, which have adapted themselves from generation to generation to new needs, as they have adapted themselves to new weapons. As for new States — the 77 listed in these pages which have been established since 1945 — their sovereign status demands, in the eyes of their own peoples, that they should display a readiness to defend their independence by the establishment of their own military institutions, even of the most minuscule and representational kind. And once established, these institutions acquire a self-image and a perception of the world around them which makes their growth virtually inexorable. Considerations of international prestige are almost inseparable from those of functional need. Expectations of threat become self-fulfilling prophecies. Hence the armourers thrive.

One final observation. Pre-1914 European armies, with the exception of the French, were *royal* forces. Their mystique was based on loyalty to a monarch, as that of the British army still is. But today many, perhaps most, armies derive their mystique from a movement of national liberation or a war of independence, which has usually involved social revolution as well. It was a tradition established even before 1914 in Latin American armies. But the armies of the USSR (in 1918–21), of Yugoslavia (in 1941–5) and of Israel (from 1936–49), literally created themselves, as they created a new social and political order, by fighting. They are thus in a special sense the symbols of their States and of the revolutions which brought them into being.

Most armies of Third World States, even (perhaps especially) those which did not have to struggle for independence, see themselves in the same way. In such armies the tradition of the revolution, of the freedom fighter, blends uneasily with that of the military professional dedicated to the maintenance of State power against both external and, if necessary, internal threats to its security. In France, the USSR and Israel the transition from revolutionary to professional force is complete. In the newer States, especially those professing varying degrees of revolutionary socialism, the armed forces are still in a state

of uneasy and unstable equilibrium. But if history is any guide, sooner or later they will all eventually settle into a professional mould, hierarchical, disciplined, deeply concerned with the technology of their profession and seeking escape from the political complexities of the society which surrounds them in an elaborate sub-culture of their own. But when these complexities become unendurable, the armies move out of their barracks and try to remake society in their own image. In a large number of the cases listed here they already have; and once they have done so it is not easy to get them back into their barracks again.

This is therefore not just a book for military enthusiasts. It is a valuable guide for anyone who seeks to understand the complex and disturbed societies that between them make up the contemporary world.

All Souls College, Oxford, 1979

M.E.H.

AFGHANISTAN

HISTORY AND INTRODUCTION

Afghanistan, like two of its three neighbours — the Soviet Union and Iran — is a country where the dominant national group constitutes not much more than half the population, and lives in only part of the total area. Unlike the Persians or the Russians, however, the Pushtoons have only relatively recently established their political independence and their rule over the more extensive areas they now control. A large part of the reason must be that their superb military qualities were usually defeated by their equal devotion to a tribal form of organisation in which feud, faction and an ingrained distrust of all centralised authority were paramount.

The Pushtoons are the nation, split into a myriad of great and little tribes, sub-tribes and clans, who speak the Pushto language and live south and east of the Hindu Kush (broadly speaking, the south-eastern half of Afghanistan, and the north-western parts of Pakistan). They are also known in English as Afghans, as Pakhtuns (Pushtoon as pronounced in the eastern dialects), and as Pathans (an Indian corruption of the word), but they are identically the same people under all these names.

The historic origins of the Pushtoon people are obscure, but for a long time they have been the dominant population in the area. They have provided many soldiers and some noted commanders to the imperial armies that have swept repeatedly through their land, which was always a major corridor of trade, of migration and especially of invasion (of northern India), but for a very long time they failed to assert themselves as a nation.

After one last round of Persian conquest by the military phenomenon Nadir Shah, who overran Afghanistan on his way to conquer Delhi, the history of Afghanistan as such begins with Nadir Shah's murder by his own officers in 1747. Independence for the Pushtoons became possible, for he had smashed Moghul power, but no powerful Persian State survived him, and the waves of nomad conquerors were no longer rolling in periodically from the central Asian reservoir (thanks mainly to Russian expansion).

The kingdom of Afghanistan was actually founded by Nadir Shah's personal body-guard, who happened to be recruited from the Abdali tribe of Pushtoons, from the area around Kandahar. Seeing the opportunity (and having fallen out with the Persian army commanders anyway) they raced home, called the Abdali clans together, had their commander, the 23-year-old Ahmed Khan, chosen as King, and set about conquering the rest of Afghanistan and its neighbourhood. Ahmed Shah, as he became, proved to be good at it, rapidly seizing all of what is now Afghanistan, and then devoting himself to conquest further afield, especially in rich northern India, which he invaded nine times before his death in 1772.

The crown remained in the same tribe (renamed the Durrani) for the next two centuries, but that tribe comprised less than a tenth of the Pushtoon population. The fiercely independent instincts of other Pushtoon tribes and the fractured, mountainous geography of the country made necessary an extremely loose, semi-feudal system of administration. The central power's weakness was exacerbated by the absence of a principle of primogeniture, leading to repeated succession struggles within the dynasty. After Ahmed Shah's death, the kingdom rapidly declined in power and in cohesion.

The capital was moved from Kandahar to Kabul by his successor, but upon the latter's death in 1793 there set in almost half a century in which monarchs were frequently assassinated or deposed, amidst recurrent civil war. During this time of troubles all territories beyond Afghanistan proper were lost to the rising Sikh power to the east: not only the Punjab and Kashmir, but also all the territories between the Indus river and the hills. This latter loss was of permanent importance, for these territories — today the North-West Frontier Province and the northern parts of Baluchistan province in Pakistan — contain almost half of the total Pushtoon population. Shortly afterwards, in the Second Sikh War of 1848, all these lost territories would pass into the hands of the British Indian Empire, and thence a century later to the successor State of Pakistan. It is a grievance which still dominates Afghanistan's foreign relations.

The advent of British power in north-western India was also disastrous for Afghanistan in a more direct and immediate sense. Just at the time when a single ruler, Dost Muhammad, had at last succeeded in having himself crowned as ruler of a united Afghanistan again, in 1837, British Russophobia led to the first of three British invasions of Afghanistan. Then, as later, Britain's fears that the gradual Russian expansion in central Asia could lead to a Tsarist attack on India via Afghanistan were so exaggerated and ill-founded as to verge on the paranoid. The 1838 invasion, for example, was occasioned by the appearance of one Lithuanian-born Russian junior officer in Kabul. But such anxieties were to govern British policy towards Afghanistan for a century, and eventually to reduce the State to something near a dependency (though not a colony).

The 1838 British invasion succeeded easily, there being nothing worthy of the name 'army' surviving in Afghanistan, and for 2 years the country appeared to be settling down as another princely State requiring only token British forces to maintain order. In 1841, however, the whole country rose in revolt against brutal maladministration by foreigners, and catastrophe engulfed the British army attempting a winter retreat from Kabul. Subsequent British retaliation was

World Armies

spectacular, including exemplary massacres and the burning of Kabul, but the decision was taken to abandon the country. The puppet king was killed by his subjects, and Dost Muhammad resumed the throne.

He had more or less reunited the country by his death in 1863, and had instituted the policy of refusing entry to almost all foreigners, and banning foreign travel for almost all Afghans, which was to retard significant change in Afghanistan until well into the twentieth century. This self-imposed isolation undoubtedly aided in the difficult task of preserving the country's independence, caught as it was between the upper and nether millstones of Russian and British imperialism, but it also contributed to the fact that Afghanistan is today among the five poorest nations in the world (according to United Nations statistics), with over 95% illiteracy, not a single kilometre of railroad, and only half of those born surviving to adulthood.

Afghanistan's present population is officially estimated at about 18,000,000. It is not a homogeneous population: only about 11,000,000 are Pushtoos (though there are at least 6,000,000 more across the border in Pakistan). The majority of the remainder are Tajiks, speaking a dialect of Persian called Dari, most of whom live amongst the Pushtoos and under their hegemony, often as tenants. The Hazaras, a unique people of Mongolian descent about a million strong who are settled in the central massif west of Kabul, also speak Dari, while most of the million-plus central Asian Turks settled between the Hindu Kush and the Soviet border speak Uzbek. The majority of the nomads, numbering perhaps 2,000,000, are Pushtoos, Turcomans and a few Arab tribes. The total urban population is less than 1,500,000, and social patterns still remain fairly static.

This distribution of population is unchanged from the last century, and accounts for the difficulties faced by Sher Ali Khan, Dost Muhammad's successor, when he first sought to create a regular Afghan army on the European model in the 1870s. It proved impossible to draft or recruit soldiers from amongst the belligerent Pushtoon tribes (who were more concerned to retain the ability to defy the central authority), and those conscripts whom he was able to collect were drawn almost exclusively from among the non-tribal and socially inferior Hazaras and Tajiks. Though they were dressed and (sketchily) equipped on European lines, they were utterly without officers capable of training or commanding them.

In 1875 the Russian border in central Asia arrived at Afghanistan, which shortly led to renewed British demands for concessions from Kabul, amounting to the loss of Afghan independence, in order to guarantee that the Russians would be kept firmly out. Sher Ali's refusal was followed by the second British invasion of Afghanistan, in 1878, and his new-model army proved only 'a uniformed mob, whose sole cohesive force lay in the tendency of its members to flee at the same moment'. As before, the conquest was easy, but the occupation one of mounting expense in lives and money, and by 1881 Britain had withdrawn again.

The man who then emerged as King, Abdur Rahman, known deservedly as 'the assassin' by his countrymen, was probably Afghanistan's most hated ruler, but by the time he died 20 years later he had single-handedly dragged Afghanistan forward into the twentieth century. His principal tools in establishing and strengthening central authority were bribery, murder, torture and above all the regular army, which he at once began to rebuild and expand.

Abdur Rahman brought in a kind of conscription to replace the previous forced levy: the new system, known as *hasht nafri* (eight men) required each village to send one out of every eight men between twenty and forty in turn for a 2 year period of duty, and to pay the costs of his uniform and keep. It was less effectively enforced against the Pushtoon tribes, so the bulk of the army remained Tajiks and Hazaras, low in morale and not very efficient, but there was now regular pay and modern firearms (though ammunition was generally so scarce as to preclude target practice). The officer corps — almost entirely Pushtoon, as with all other branches of the State administrative structure — were considerably improved by the suppression of nepotism. With the aid of liberal British financial aid, an arsenal was constructed in Kabul to reduce dependence on foreign sources for small arms and other ordnance, supervised training courses were introduced, troops were organised into regiments, brigades and divisions, containing battalions of artillery, and a formal (and harsh) code of discipline was imposed. It was this army, under the command of Abdur Rahman's general, Ghulam Haidar Charkhi, which cemented the unity of modern Afghanistan in more than a dozen major campaigns against rebels which the ruler frankly referred to as 'civil wars'.

It was also during Abdur Rahman's reign that Afghanistan's important borders were defined. In 1893 the Durand Line, fixing Afghanistan's eastern border, was accepted by Kabul under the veiled threat of yet another British invasion, although it cut off all the Yusufzai tribe and divided the powerful Waziris, Mohmands and Afridis, as well as many smaller ones. Abdur Rahman also had to agree to deal with other nations only through British mediation, but in return received an annual British subsidy. Two years later, in 1895, the 700 mile Russo-Afghan border was surveyed and agreed. (The short Chinese frontier was not finally delimited until 1965, and there is still no formal agreement — though no dispute either — with Iran.)

The transition from Abdur Rahman to his son Habibullah in 1901 was unimpeded by violence, in defiance of Afghan tradition. The new ruler pursued a careful policy of slow modernisation, always aware and cautious of the existence of powerful conservative (mostly Islamic) resistance. A few roads and factories were built, Afghanistan's first public school along European lines founded, the first newspaper was published, and Habibullah managed to keep Afghanistan out of World War I despite strenuous German and Turkish attempts to bring it in. But when he was assassinated in 1919, his successor embarked on a far more daring and dangerous policy of rapid change.

King Amanullah, who came to the throne in 1919, at once declared Afghanistan fully independent from Britain in both foreign and internal affairs, which promptly led to the Third Afghan War. It amounted to hardly more than border clashes,

however, and in the peace Britain recognised Afghanistan's independence. Kabul then proceeded to open diplomatic relations with Britain and the Soviet Union, and subsequently with other States as well.

Amanullah's first act on gaining power had been to double the army's pay, to guarantee their loyalty against contenders for the succession. Under his reign it got Turkish instructors, and a small air force was founded in 1924, with 11 Russian pilots to fly its aircraft. By the 1920s the army's organisation and administration were regularised on European lines, and in 1932 a military academy was opened. But it remained such an ineffective armed force that the only way of quelling any significant tribal revolt (amongst people who were, after all, characterised by their British opponents on the North-West Frontier as the best guerrilla fighters in the world) was to seek the support of other tribes against the rebels. When this didn't work, Amanullah fell.

The concerted opposition to Amanullah was mainly made possible by his radical policies for domestic change, including such items as the abolition of the veil and the official discouragement of polygamy. Religious and tribal leaders, their natural conservatism reinforced by a century of well-justified xenophobia, finally ganged up to unseat him, and his regular army, though loyal, proved insufficient. Indeed, in 1929 a large portion of it was wiped out north of Kabul by a mere bandit chieftain, who proceeded to replace Amanullah as Shah. He was in his turn displaced by Nadir Shah, a candidate from the traditional ruling family, who had the added attraction of being literate, in 1929. Nadir Shah was of a military background, and a former War Minister, and immediately embarked on a new effort to reorganise and revitalise the army, but in his turn he was assassinated in 1933.

His nineteen-year-old son Muhammad Zahir Shah succeeded him without difficulty, however, and proceeded to rule Afghanistan for the next 40 years until 1973. The first twenty of those were relatively placid, with Zahir Shah leaving most power in the hands of three trusted uncles, who ensured that the rate of change in the country should not again become so rapid as to arouse once more the opposition which had overthrown Amanullah. Afghanistan stayed out of World War II without any serious problems, and arrived in the early 1950s little altered from a generation before. The principal foreign military influences on the Afghan armed forces during this period, and indeed until the present, were those of the Soviet Union and Turkey, both of which have maintained military training missions in Afghanistan and accepted Afghan officers in their military educational establishments for most of the past 50 years.

In 1953, when a new prime minister with different ideas came into office, the armed forces of Afghanistan were still scarcely capable of suppressing a large tribal revolt. Infantry rifles dated from the previous century, and ammunition was so scarce and old that few soldiers had fired their weapons. Some of the tribes were significantly better armed. The artillery was antiquated, and the total strength of the air force was 12 aircraft which dated from World War I. There were no mechanised forces of any kind.

The new prime minister, who dominated Afghan history, with intervals, for the next quarter-century, was to change all that. He was Sardar (Prince) Muhammad Daud Khan, a member of the royal clan and doubly related to the King as cousin and brother-in-law. Educated at the Afghan Military School, he had risen in the army, showing great drive in putting down the last major tribal revolt in 1947, and just prior to 1953 he had been Minister of Defence. His first concern as Prime Minister was the modernisation of the army, and the decisions he then took have shaped not only Afghanistan's armed forces but also much of its diplomacy ever since.

Daud turned to the Russians for help in modernising his army. His reasons for doing so were complex, but most revealing of the priorities held by subsequent Afghan governments.

One urgent reason for modernising the army and strengthening the administration was the chronic problem of tribal revolt. It scarcely mattered whom the aid came from in this context, and indeed Afghanistan had long been asking the USA for assistance, quite without result. The other main reason for improving the armed forces, however, was 'Pushtoonistan', and in this case the source of the military aid was a rather sensitive subject.

The incorporation of almost half the Pushtoon population first into the Sikh State, and then into British India, had been accepted under protest by an Afghan government powerless to prevent it, but the incorporation of those territories into the new State of Pakistan in 1947 was totally unacceptable to Kabul. In 1947 the Afghan government denounced the Durand Line, which had defined Afghanistan's eastern border since 1893. It demanded that the Pushtoon-populated areas of Pakistan (extending as far as the line of the Indus, including Chitral, Swat and Peshawar, and continuing south through North-West Frontier Province as far as the Pushtoon area of northern Baluchistan) should be recognised as the State of 'Pushtoonistan' or 'Pakhtunistan'. At times Kabul has called for independence for this area, at times merely for autonomy, but its insistence on the principle has never varied. Afghanistan was, indeed, the only country to vote against Pakistan's admission to the United Nations.

All Afghans feel strongly about Pushtoonistan, but Daud, whose great-great-grandfather was the last Afghan governor in Peshawar, undoubtedly felt more strongly than most. Pakistan has been the only neighbouring State whom Afghans seriously consider as a potential military opponent since 1947, and if the army were to be built up partly for that contingency — as was certainly the case — then there were certain definite disadvantages in linking oneself to American military aid. Principal among these was the fact that the United States was then engaged in constructing alliances to contain what it saw as Russian expansionism in the area, and was far more concerned to include Pakistan than Afghanistan. One must also not overlook the simple fact that the only practical route for American military aid to reach landlocked Afghanistan in the 1950s was via Pakistan. Aid from the Russians, by contrast, would be subject neither to blockade nor to divided loyalties on the part of the donor.

World Armies

In the eyes of almost all educated Afghans, moreover, there were few objections to accepting Soviet military aid. None of them for a moment believed in the possibility of a Soviet invasion. Subversion seemed implausible, given Afghan xenophobia, a pervasive police system, and the virtually total absence of anything resembling an industrial proletariat. The one previously existing barrier, the tendency to panic so prevalent in British Viceroy's in India, had vanished with the viceroys.

Negotiations with the USA for military aid and some form of defence agreement continued during the first 2 years of Daud's Prime Ministership, and the break-down ostensibly came because of American refusal to extend a security guarantee to Afghanistan, but other factors were in fact more influential. In 1954 Pakistan signed a Mutual Defence Assistance Agreement with the USA, provided the latter with military bases, and joined SEATO; in the following year, both Pakistan and Iran joined the Baghdad Pact (now CENTO). When Mr. Khrushchev visited Kabul in 1956, offering a \$100,000,000 Soviet loan, it took little persuasive power for the Prime Minister to get the assent of the *Loya Jirga* (traditional tribal council) to accepting Soviet military aid as well.

It was a decision that stuck. For a while trade and foreign aid were almost monopolised by the Soviet Union (between 1957 and 1972 60% of Afghanistan's foreign aid — \$900,000,000 — came from the Soviet Union, and even now it takes more than half Afghanistan's trade), but in military aid the Soviet monopoly was virtually total, and survives to this day. The vastly expanded military forces are armed exclusively with Soviet equipment, the only foreign military advisers in the country for the past two decades have been Russians, and an entire generation of Afghan officers has matured under the predominant influence of Soviet military doctrine (often learned at military education establishments in the USSR).

There has never been any overt Soviet meddling in Afghan domestic politics, and in terms both of professional competence and of modern equipment the Afghan armed forces have benefited immensely from Soviet assistance. Most Afghans see Pakistan's difficulties with its American alliance since 1965 (a 10 year American arms embargo, for example) as confirmation of their wisdom in choosing otherwise. Not all Daud's innovations as Prime Minister survived him, but the Soviet military link has never been seriously questioned.

Daud's policies were adventurous both at home and abroad. He introduced 5 year economic plans, abolished the veil for women, and in 1961 began sending students to the Soviet Union. He pushed so hard on the Pushtoonistan issue that by 1961 there were Pakistan-Afghanistan border clashes and a rupture of diplomatic relations. While these policies alienated or frightened some Afghans, his apparent lack of interest in any sort of democratisation of the regime annoyed others of the *élite* equally. In 1963 he was forced to resign by Palace intrigues, and spent the following decade out of politics.

The new Prime Minister, Dr. Muhammad Yusuf, was the first from outside the royal family, and in 1964 he introduced a democratic constitution designed by young Kabul intellectuals. The parliament thus created never functioned properly, however, as the monarch timidly refused to permit political parties, and on the whole the governments of Dr. Yusuf and his successors were ineffective in producing any major change in the country's political or economic circumstances. This state of affairs continued for a decade, until abruptly ended by Afghanistan's first modern military coup in July, 1973.

The armed forces' loyalty to the King was normally assured by his direct control over personnel matters (all appointments of captain rank and above in both army and air force required his personal approval). Inevitably, a high proportion of senior promotions went to men drawn from families linked with the King by the ties of the Muhammadzai clan. The main motive force for the 1973 coup, beyond disillusionment with the pace of development under Zahir Shah's latter governments, seems to have been frustration amongst younger officers at the lack of promotion for those outside the kinship net.

The conspiracy was led by some 20 young army and air force officers, many of them trained in the Soviet Union and of more or less clearly defined leftist views, who constituted themselves into the 'Central Committee of the Revolution'. Muhammad Daud seems to have been brought into the plot only late in the planning, to serve as a figurehead. His key role in organising the modernisation of the armed forces made him a popular figure within the services, while his reforming but non-ideological zeal made him an encouraging and reassuring figure for civilian onlookers. The coup went off smoothly, aided no doubt by the fact that one of the leaders, Major Faiz Masoud, commanded the elite force guarding the King. A full list of Central Committee members was never published.

A republic was promptly declared, with Muhammad Daud (no longer using his princely title) as President. The radical young officers gradually discovered after 1973, however, that Daud had no intention of remaining a mere figurehead, and slowly lost ground before him. In early 1977 he proclaimed a new republican constitution, and an end to the purely military government. In April, 1978 the displaced and often demoted young radical officers of 1973 struck back, in a coup which killed Daud and much of the armed forces' high command amidst 2 days of severe fighting in Kabul. They now control the country through a Revolutionary Command Council, in association with the Moscow-orientated People's Democratic (i.e. Communist) Party.

STRENGTH AND BUDGET

The strength of the Afghan armed forces in 1977 was 110,000 men, a 10% increase on the previous year. The army numbered 100,000 men, the bulk of them being conscripts, and the air force 10,000. Afghanistan, being a landlocked country, does not have a navy.

The army's trained reserves total about 150,000, while those of the air force are 12,000. There is a paramilitary force of 30,000 gendarmerie, under the control of the Ministry of Internal Affairs, and a force of at least 200,000 tribal levies, fierce but ill-trained and equipped. A National Guard (presumably intended to reflect the political colour of the new regime and to defend its interests) was founded in May, 1978, but no details are available.

Afghanistan's defence budget for 1977-8 was \$60,700,000, out of a GNP of \$2,300,000,000.

COMMAND AND CONSTITUTIONAL STATUS

Details of the new government were not available at the time of writing, but it formally consists of three tiers: in ascending order of authority, they are the Cabinet, the Revolutionary Council and the Central Committee of the People's Democratic Party. All members of all three bodies belong to the PDP, and the majority are civilians; there are only three officers in the 21 man Cabinet, and five officers in the 35 member Revolutionary Council. This undoubtedly understates the degree of military influence in the government, however, as it was military officers who were secretly members of the PDP who made the coup while the civilian leadership was in jail, and as the only source of support for the new government's policies, given the virtual absence of mass organisations of any sort in Afghanistan, is the armed forces.

The governmental structure is formally of the one-party civilian model, however, with PDP leader Nur Muhammad Tarakki serving as President, Prime Minister, chairman of all three tiers of the structure and, since August, 1978, when a number of the PDP's leading military allies were arrested on charges of plotting a coup, also as Minister of Defence. The 1977 Constitution has been abrogated, and no information is yet available on the changes which have almost certainly occurred in the military command structure, although it is clear that a system of political commissars has been introduced in an attempt to supervise the loyalty of the officer corps.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

The principal responsibility of the Afghan army has almost always been the maintenance of the central government's authority over the multitude of independent-minded and heavily armed Pushtoon tribes, and the great bulk of its operations historically have been campaigns to suppress tribal revolts. It is now three decades since the last really serious tribal rising, but there can be no question that internal security remains a role of more than residual significance for the army.

The modernisation and mechanisation of the army since 1956, and the simultaneous creation of an air force larger in relation to population and resources than any other in western Asia, are not merely a spontaneous exploitation of the Soviet largesse that then became available, however. They represent a serious and by now quite credible attempt to create a military capability against neighbouring Pakistan, should political circumstances ever bring them into open conflict over the Pushtoonistan question.

Despite the considerable larger total size of Pakistan's armed forces, in the key areas of armour and combat aircraft Afghanistan's forces now possess about three-quarters as many machines (of slightly more recent vintage) as Pakistan. While the Pakistan-Afghanistan border is hardly the best tank country in the world, the passes have been forced innumerable times by determined armies over the past few millenia. In view of the fact that the bulk of Pakistan's armed forces for the foreseeable future must be positioned along the Indian border, it is not surprising that Afghan military capabilities are taken extremely seriously by Pakistan.

The recent coup has simultaneously increased the armed forces' internal security task — by making them the main support of a regime which faces violent opposition from the socially conservative and strongly religious tribes — and also their external defence problems. Pakistan views the new Afghan regime with strong distaste and mistrust, while Iran, hitherto friendly, is concerned by the Kabul government's political complexion, its close Soviet links, and the possibility that it might attempt to reignite the dormant separatist movement in Iranian Baluchistan or to export its revolution via the 1,000,000 Afghans working in Iran. Pending evidence of such intentions, Tehran has adopted a non-committal attitude to the Afghan regime, but its formidable armed forces, facing a frontier which Afghanistan has traditionally neglected, could pose a very serious problem for the Afghan army if a political confrontation should develop.

Afghanistan's armed forces have no international commitments except the military assistance agreement with the Soviet Union, and no elements are deployed beyond its borders. The army has not fought a foreign force since the Third Afghan War with the British Empire in 1919, and the last major campaign against an internal revolt was fought against the Safi tribe in 1947.

ORGANISATION

Arms of Service

The Afghan army is organised into three armoured divisions and 10 infantry divisions, all kept under strength along Soviet

World Armies

lines, to be filled up by reservists in an emergency. There are three full-strength mountain infantry brigades. Artillery, engineers and the various service corps are organised largely on the Soviet pattern.

The air force, which is independent but subordinate to the army, is mainly organised on a squadron basis, consisting of six fighter-ground attack squadrons, three light bomber squadrons, three interceptor squadrons (which do possess an overall wing organisation), two transport squadrons and three helicopter squadrons.

The air force contains an air-defence division, incorporating Afghanistan's heavier anti-aircraft equipment. It is organised into a SAM brigade consisting of three battalions each controlling 16 SA-2 missiles, an AA brigade of two battalions equipped with 37 mm, 85 mm and 100 mm AA guns, and a radar brigade of three battalions.

Operational

The Afghan army is organised into three army corps. Their headquarters, at Kabul, Gardez and Kandahar, are all within 50 miles or so of the eastern border, facing the main passes leading down into Pakistan. There are also four separate divisions, stationed in areas of the country beyond the territorial boundaries of the three corps organisations, which report directly to the Ministry of Defence in Kabul. Only very light forces are deployed west and north of the Hindu Kush, facing the Iranian and Soviet borders.

The principal air force fighter base is at Bagram, and the main bomber base is at Shir Dand (Sabzawar). Other air force installations are at Gardez, Ghazni, Herat, Jalalabad, Kandahar, Kunduz, Mazar-i-Sharif and Sherpur. Military airfields would probably not function very well without Soviet technical assistance, but they are all under Afghan control.

RECRUITMENT, TRAINING AND RESERVES

The Afghan army's regular officer corps is voluntarily recruited, and receives its training at the Afghan Military Academy. (Most regular officers are also graduates of the Military High School in Kabul, which takes boys from the age of ten.)

There is also a technical school and a school for each principal arm, and many officers subsequently train abroad. Most non-commissioned officers are also long-service regulars, and receive their training at an NCO's school, and sometimes also at technical schools within Afghanistan. Air force flying training is done at Mazar-i-Sharif, and the Air Academy at Sherpur has about 400 cadets. The majority of air force personnel are regulars.

A very high proportion of regular officers come from the royal clan and from other families closely associated with it. This recruitment pattern was effectively continued by Muhammad Daud after the creation of the republic in 1973, as a result of which there is an extremely wide social gap between officers and men. Despite the very rapid growth of ideological loyalties alongside the traditional kinship loyalties within the officer corps, and the far-reaching purges after the April, 1978 revolution, this situation still largely prevails.

The bulk of the army is provided by conscripts, who are called up between the ages of twenty-two and twenty-eight for 2 years' service in accordance with the Conscript Act of 1954. Youths in higher educational establishments do their service as conscript officers, and must serve only 1 year, most of which is spent at the Reserve Officers' School. All able-bodied men are liable for military service, but it is in fact selective service: the overall call-up figure for the year is decided by the army in consultation with the government, and apportioned between the provinces, but the actual selection of individuals who must serve is done by local arrangements within each province. A proportion of conscripts are drafted into the Labour Corps (employed mainly on public works).

Conscription theoretically applies to all Afghan males of military age, but certain tribes are in practice exempted in return for agreement to provide tribal levies in times of emergency. Others, such as the Kirghiz group in the Wakhan corridor extending to the Chinese frontier between the Soviet Union and Pakistan, assume responsibility for border patrols in their area in return for exemption. Wherever practical, conscripts are assigned to units widely separated from their own areas, to encourage the growth of national consciousness and to avoid a conflict of loyalties if the army becomes involved in internal security operations.

The organised reserves total 162,000 men, and are administered by General Reserve Headquarters in Kabul. Conscripts are placed on the reserve list upon discharge, and are liable for 2 month periods of refresher training any time during the next 22 years. There is a mobilisation organisation, and an officer reserve also exists. The several hundred thousand tribesmen living near the Pakistan frontier who would be available as irregular auxiliaries in an emergency have a loose reserve organisation to direct them, and in certain circumstances could prove a formidable problem (as Pakistan proved when it sent the tribes into Kashmir in 1948). Their potential effectiveness is enhanced by the fact that they are mostly fellow-tribesmen, and often close kinsmen, of the Afridi, Waziri, Mohmand, Bajauri and Mahsud tribes of Pushtoons on the Pakistan side of the border.

During the 1960s almost all higher technical and military instruction for the armed forces was provided by the Soviet Union, which as late as 1973 had over 1000 advisers with the Afghan army. Thousands of Afghan officers received training in the Soviet Union, while only a handful were sent elsewhere (USA, France and Turkey). After the 1973 coup, however, there were signs of major changes in this pattern.

Although there was no intention to reduce Afghanistan's dependence on the Soviet Union as its exclusive arms supplier,

the number of Soviet advisers with the army was cut to no more than 200. Afghan officers continued to receive some of their training on Soviet equipment outside the country, but increasingly this was done in India (also almost exclusively Soviet-equipped in recent years), where the likelihood of Marxist influences making large inroads into the officer corps is less great. This reorientation had its roots in concern for the political trend within the Afghan officer corps; now that the 1978 coup has demonstrated the accuracy of that concern, it is to be expected that the direct Soviet role in training Afghan officers and technicians will once again increase. The number of Soviet military advisers in Afghanistan is now reported to be in the low thousands, and they are attached to many tactical units. Afghan officers are again attending Soviet military schools in considerable numbers.

EQUIPMENT AND ARMS INDUSTRY

The army and air force are both exclusively equipped with Soviet weapons, to a technical standard that would correspond to that of the Soviet Union *circa* 1965. In the past 20 years Afghanistan has received more than \$300,000,000 of Soviet military aid.

The army's armoured strength consists of 500T-54/55 and T-62 medium tanks, and 200T-34s which are being progressively replaced by the former, newer models. There are 40PT-76 light tanks and BMP MICVs, and a certain amount of mechanised infantry can be accommodated in the 400BTR-40/-50/-60/ and -152 APCs. The principal anti-tank weapons are Sagger and Snapper ATGWs.

The approximately 900 guns and howitzers are of 76 mm, 100 mm, 122 mm and 152 mm calibre, and there are 100 120 mm mortars. The army is also furnished with 50 132 mm multiple rocket launchers, and its light anti-aircraft defence consists of 350 37 mm, 57 mm, 85 mm, 100 mm and ZSU-23-4 SP AA guns. It now also has SA-7 SAMs.

The air force has 144 combat aircraft. The bulk of it is ground-attack aircraft, comprised of 30Il-28 light bombers, 50MiG-17s and 24Su-7s. There are 40MiG-21 interceptors. The two transport squadrons have 22 aircraft, and the three helicopter squadrons about 30 machines. The air-defence division has one SAM brigade (three battalions with 48SA-2 missiles), one AA brigade (two battalions with 37 mm, 85 mm and 100 mm guns), and one radar brigade (three battalions).

There is no arms industry in Afghanistan.

RANK, DRESS AND DISTINCTIONS

The rank and grade structure generally resembles the British pattern, with the additional ranks of third-lieutenant and senior captain. Rank insignia for regimental-grade officers consists of gold bars and gold-coloured stars (sunbursts) worn on green epaulettes: third-lieutenants wear one bar, second-lieutenants one bar and one star, first-lieutenants one bar and two stars, junior captains two bars and one star and senior captains two bars and two stars.

Field-grade officers wear gold-coloured crossed swords and gold stars on maroon epaulettes: majors wear crossed swords and one star, lieutenant-colonels crossed swords and two stars and colonels crossed swords and three stars. All field-grade officers also have maroon and gold cap cords and maroon collar tabs embossed with a gold stalk of corn.

General officers' rank is indicated by gold-coloured national crest emblems and stars worn on crimson epaulettes: brigadier-generals wear the crest and one star, major-generals the crest and two stars, lieutenant-generals the crest and three stars and generals the crest and four stars. The rank of field-marshal exists, but is rarely used. All general officers have gold cap cords and crimson collar tabs embossed with two gold stalks of corn.

More than a dozen military decorations and awards existed under the former regime, most of them including money, grants of land, or both, but it is not yet clear whether they will be maintained or altered by the new government.

CURRENT DEVELOPMENTS

President Muhammad Daud's regime was overthrown on April 27th, 1978 by a bloody coup led by officers belonging to the Afghan Communist Party. In the 2 days of fighting in the capital a large number of people were killed (the more plausible estimates range from 400 to 5000 dead). There was particularly heavy fighting around Central Corps headquarters and the Justice Ministry, where air force SU-7s made rocket attacks to aid the rebels, and in the vicinity of the 7th and 8th Divisions which were based near Kabul. President Daud's 1500 man guard held out in the former Royal Palace for 16 hours, until it was reduced to rubble by the fire of some 50 tanks and air force MiGs. Daud was captured and executed in the palace courtyard, after being compelled to watch the machine-gunning of some 30 members of his family including women and children.

The coup was carried out by relatively young officers, many of whom had been involved in more junior roles in the 1973 revolution and had subsequently been pushed aside or even demoted by Daud. Most units involved were from the air force or the armoured forces, the two branches where Soviet training influence has been greatest: the most prominent leaders were Colonel (later Brigadier-General) Dagarwal Abdul Khadir of the air force and Colonel Muhammad Aslam of the

World Armies

armoured corps. All the military leaders, however, subsequently proved to have been secretly members of the Communist Party.

The People's Democratic Party (it eschews the word 'Communist', in deference to the Muslim beliefs of the Afghan population) does not appear to have been a major influence on the young leftist officers who engineered the 1973 coup that brought Daud to power. Indeed, it split in the course of a controversy over supporting Daud's regime, the larger Khalq ('People') faction under Ahmad Tarakki's leadership refusing co-operation while the Parcham ('Flag') faction followed Moscow's orders and accepted places in Daud's government. Neither faction is known to have had any part in the numerous attempted coups and uprisings with which Daud had to contend in his first years in power: an attempted coup in September, 1973 from the centre of the political spectrum, involving a former prime minister and eight senior officers, conspiracies in December, 1973 and June, 1974 involving conservative mullahs and some junior officers of strong Islamic convictions (in the latter case nearly 100 officers, apparently belonging to the Muslim Brotherhood); and an abortive uprising by the fundamentalist Jamaat Islami Afghanistan Party in 1975.

As Daud gradually consolidated his hold on power and subdued the Islamic right (and disappointed rivals of the political centre) however, he began to remove from positions of power the young radical officers whose support had previously been indispensable. The key act was probably his purge of Soviet-trained air force officers suspected of communist sympathies in April, 1974 (Brigadier-General Abdul Khadir, first Minister of Defence in the 1978 revolution, was demoted in that purge). The shadowy Central Committee of leftist officers who had invited Daud to lead their revolution met for the last time, it is believed, in late 1974. It now seems clear that it was at this time that considerable numbers of disappointed leftist officers formally joined the Khalq Party (secretly, of course).

During 1977 Daud removed the representatives of the dissident Parcham faction from his government, and the two branches of the Communist Party then reunited under the leadership of Mr. Tarakki. The immediate cause of the coup was the murder of the leader of the Parcham faction, Mir Akbar Khyber, allegedly by government agents. His funeral on April 17th, 1978 was attended by serious demonstrations, and the government began large-scale arrests of communist leaders: Mr. Tarakki and his civilian colleagues were jailed on April 24th. Perhaps anticipating similar arrests within the armed forces, military adherents of the Khalq Party launched the successful coup of April 27th, released Mr. Tarakki and appointed him President. There is no evidence that they were acting on Moscow's orders, or even with Soviet blessing.

The new regime's principal task for some time to come will be ensuring its own survival in the face of hostile neighbours, turbulent tribes, and a powerful Islamic conservative movement, organised in the secretive Muslim Brotherhood and other groups, which counts many adherents in the officer corps. President Tarakki seems conscious of the impossibility of converting Afghanistan into an orthodox Communist State. He has pledged to continue Afghanistan's policy of non-alignment (specifically disavowing any intention to enter a military alliance with the Soviet Union), promised to maintain the position of Islam in the country, and spoken with notable reserve even about such centrally important topics as land reform.

The regime has taken drastic measures to secure its hold on power against domestic opposition. Of some 60 to 80 army and air force generals in April, only about a dozen remained in their old commands in May; the rest had been killed in the fighting, were in jail, or had gone into hiding, while their jobs were being done by young majors and captains. The new police chief was an air force major (the air force contains more Khalq Party adherents, and is generally more leftist and pro-Soviet, than the army), and a National Guard was being formed to serve as a party militia. Extensive political purges were initiated in the armed and civil services, concentrating especially on members of the Muhammadzai clan, and there were reports of mass arrests in the clan's own territories. All provincial governors were dismissed and replaced by military personnel (the Khalq Party having virtually no civilian members outside Kabul and Kandahar).

Tribal resistance to the new government began almost at once, notably in the Jalalabad region near the Pakistan border which is the seat of the Muhammadzais, and a National Rescue Front grouping the various tribal-cum-Islamic strands of opposition to the new regime was created in exile in Pakistan. In an attempt to defuse this problem, representatives of the main tribes have been brought into the Revolutionary Council. There was also trouble in the army, with one division near Kabul reportedly being disarmed by troops loyal to the regime in June, 1978 after it had shown signs of revolt. Eighty officers were subsequently dismissed. A more serious falling out between the civilian leadership of the regime and their military supporters occurred in August, 1978 when Brigadier-General Khadir, who had been made Defence Minister, was arrested, together with the Army Chief of Staff on charges of 'anti-revolutionary plotting and treason'. This was followed shortly by a renewed split between the Parcham and Khalq factions and the expulsion of many members of the former from their government posts. Meanwhile guerrilla resistance to the new regime increased in late 1978 with the coalition of two Islamic parties, now known as the Movement of Islamic Revolution, but remained concentrated in the eastern provinces near the Pakistani border. As long as the armed forces' loyalty remains unshaken, this sort of guerrilla harassment does not seem to pose a serious threat to the regime, but there can be no doubt that any prolonged involvement in a counter-insurgency war would lead large numbers of officers to query the acceptability of the regime that initiated it.

While the Soviet Union welcomes a Marxist regime in Afghanistan, provided that it is capable of surviving probable conservative reactions, there is no evidence to suggest that Moscow actively sought to bring that situation about, nor that it now controls the decisions of the Afghan government. Indeed, the Soviet Union participated as lavishly as all Afghanistan's other suitors in the flood of foreign aid that was offered Kabul after Daud's 1973 coup. By mid-1975 the Arab oil States and Iran had promised over \$2,000,000,000, and both America and China were increasing their aid, so Moscow, though

already owed immense amounts by Afghanistan, agreed to reschedule Afghan repayments and quadrupled its annual aid to \$412,000,000. Soviet aid will now doubtless increase even more, but it is not without rivals.

The new Iranian initiatives were intended to help wean Afghanistan from its close economic and military links with the Soviet Union. They include not only a May, 1975 loan of \$700,000,000 for industrial projects, and a promise of credit for a proposed rail network (a further \$600,000,000–\$800,000,000), but also a suggestion that Afghanistan should join an expanded RCD (Regional Co-operation for Development), the CENTO-derived economic organisation embracing Iran, Turkey and Pakistan. Afghanistan declined, however, on the public ground that it would damage its neutrality, and the further unspoken ground of Pakistan's membership. Despite a rush of agreements with the socialist bloc, the new Afghan government has taken great pains to reassure Iran that none of the existing agreements between the two countries cannot be replaced by fresh accords. Tehran has been careful to avoid any rupture of relations.

The dispute with Pakistan over the Pushtoon-inhabited areas, which had been temporarily laid aside in 1965 after Daud's earlier fall from power, was reopened vigorously after 1973, and relations between Kabul and Islamabad once again neared breaking point. It is a curious dispute, in that the Pushtoons of the North-West Frontier Province and northern Baluchistan, while they have always striven for greater autonomy from Punjabi rule, have never evinced any keen interest in joining economically backward Afghanistan. Nevertheless, Afghanistan was probably not totally uninformed about the various manifestations of unrest in the North-West Frontier Province in the past few years, and is strongly suspected by Pakistan of having aided the guerrilla war waged by some Baluchi nationalists further south. In 1975–6 the main Pushtoon political party (and principal opposition party) in Pakistan, the National Awami Party, was banned, and NAP leaders were subjected to what amounted to a series of treason trials.

In the circumstances it was hardly surprising that Afghanistan cultivated close relations with India, Pakistan's main security obsession, which has supported Afghan claims for Pushtoonistan since 1950. While defence co-operation between the two countries has always been strictly limited, each recognised the value of the other in the overall balance against Pakistan. Since the late 1960s India's equal dependence on the Soviet Union as principal foreign arms supplier has created some scope for Afghan soldiers to receive technical instruction in India. Afghanistan has defended India's position on its nuclear 'non-weapons', as New Delhi would have it, and both countries have rejected the Soviet proposal for an Asian collective security pact which would, amongst other things, have the effect of freezing and guaranteeing frontiers. (It remains to be seen if the new Afghan regime will maintain this latter position.)

At the urging of the Shah of Iran, the then Pakistan Prime Minister, Mr. Zulfikar Ali Bhutto, visited Kabul in mid-1976. No agreement on the question of Pushtoonistan was reached, nor does any seem possible that could be acceptable both in Pakistan and Afghanistan, but some of the public bitterness was taken out of the quarrel. The policy of the new Afghan regime on the Pushtoonistan question is not yet entirely clear, although President Tarakki and other senior leaders met with Khan Abdul Ghaffar Khan, the veteran leader of the 'Pakhtunistan' secessionist movement in Pakistan, within weeks of taking power. While there is no question of the claim being dropped, the Kabul government certainly has more urgent domestic priorities at the moment, and policy on Pushtoonistan will probably depend largely on the degree of support Pakistan lends to opponents of the Afghan regime. If Islamabad should give a free hand to Afghan anti-regime exiles to stir up the tribes in the border region, there is no doubt that Afghanistan would respond by directly aiding secessionist movements amongst the tribes in Pakistan's frontier areas.

Pakistan used to worry about Soviet intentions in the area, envisaging a Russian strategy which, using Afghanistan as stalking horse, would encompass the break-up of Pakistan and create a Russian-controlled corridor via Pushtoonistan and Baluchistan (including perhaps Iranian Baluchistan) to the warm-water ports of Gwadar and Chah Bahar on the Arabian Sea. This was also feared by Iran in the early 1970s, and the fear has now been revived. It is not likely, however, that Afghanistan would seek independently to create such a grand design, with all its attendant risks, nor indeed that Moscow (to the extent that it now commands an audience in Kabul) would wish to have Afghanistan play this role. It would also be unwise, or at least premature, to conclude that Moscow now has the last word in any disagreements between it and Kabul.

On the whole, the Soviet Union has shown much more sense than Afghanistan's other former imperial neighbour, Britain, in resisting any temptation to seize direct control and responsibility for this most intractable country even though the conclusion in December, 1978 of a Soviet–Afghan Treaty of Friendship indicates an increasingly close relationship.

GWYNNE DYER

ALBANIA

HISTORY AND INTRODUCTION

The Albanian Party of Labour was founded in 1941, and played a leading role in the struggle against the Italian and German occupation forces. The Party's leader, Enver Hoxha, commanded the Liberation Army, and in October, 1941 he became head of the provincial government. Albania was declared a People's Republic in January, 1946 after elections in which Hoxha's party won an overwhelming majority.

Albania initially came within the Yugoslav sphere of influence, and there were even plans for the incorporation of Albania into the Yugoslav federation. The Tito-Stalin dispute led, however, to the severance of relations between Albania and Yugoslavia, and from 1949 to 1961 Albania was a Soviet satellite. Albania broke with Russia in 1961, and withdrew from the Warsaw Pact in 1968. Since 1961 she has followed the Chinese lead on ideological matters, and currently receives economic and military assistance from China.

STRENGTH AND BUDGET

Strength

Population: 2,650,000

Total armed forces: 45,000 (22,500 conscripts)

Army: 34,000

Navy: 3000; four submarines, 68 small craft

Air Force: 8000; 103 combat aircraft

Internal Security Force and Frontier Guard: 13,000 (controlled by the Ministry of the Interior)

Budget

GNP (1974 estimate): \$1,100,000,000

Defence expenditure (1977): \$137,000,000

COMMAND AND CONSTITUTIONAL STATUS

Command

Hoxha holds the rank of army general, and until July, 1953 was *de facto* Commander-in-Chief of the Armed Forces. In 1953 the Minister of National Defence, a serving officer, took over the functions of Commander-in-Chief.

Constitutional Status

The People's Assembly is the supreme legislative organ. It is elected, for a 4 year term, by all citizens over the age of eighteen. The People's Assembly elects the Presidium, which, under the leadership of the President of the Presidium, carries out the functions of Head of State. The Council of Ministers is appointed by the Assembly. Hoxha is First Secretary of the Party of Labour, and Colonel-General Balluku is a member of the Party's Politburo and Minister of National Defence.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role and Commitment

The Albanian armed forces have the dual roles of defending Albanian sovereignty and safeguarding the regime. All are stationed within the borders of Albania.

Deployment

The army forms one tank brigade and nine infantry brigades, all below strength, together with eight coast artillery battalions. The country is divided into two military districts, one in the north and the other in the south; it is impossible to assess the division of troops between military districts.

Recent Operations

The Albanian armed forces have participated in no military operations since World War II.

ORGANISATION

The Albanian army was, at least until 1961, organised along Soviet lines, but it is likely that it now follows Chinese organisational patterns. The tank brigade appears to consist of three tank battalions and a motor rifle battalion.

RECRUITMENT, TRAINING AND RESERVES*Recruitment and Training*

Conscripts make up over half the army's total strength. Conscription is for 2 years in the army, and for 3 years in the air force, navy and paramilitary forces. Lack of sophisticated equipment means that most training time is relatively low-level.

Reserves

There are approximately 100,000 regular reservists. In addition, the Society for Aid to the Army and for Defence (SHNUM) gives part-time paramilitary and civil-defence training to civilians. Pre-conscription military training was made obligatory in 1953.

EQUIPMENT AND ARMS INDUSTRY

Until Albania's break with the Soviet Union, almost all Albanian military equipment was of Soviet origin. A great deal of this remains in use, but it is being complemented with, and in some cases replaced by, Chinese equipment.

Small Arms: of Soviet origin, including PPSH, AK-47, RPD and RPK; and the M-10, M-49 and M-38 heavy machine-guns. Some World War II German weapons — MP-40, Mauser 98K, MG-34 and MG-42 — would be used by reservists. Chinese copies of Soviet small arms have been imported

Mortars: Soviet 82 mm M-37, 120 mm M-43 and 160 mm M-43

Anti-tank: 14.5 mm PTRD M-41 Soviet anti-tank rifle. 45 mm M-37, 57 mm M-43, 57 mm M-55, 76.2 mm M-42 and 85 mm M-45 towed anti-tank guns

Anti-aircraft: 37 mm M-38/39, 57 mm M-50 and 85 mm M-44 Soviet AA guns

Artillery: Soviet 152 mm M-43 and M-37, 122 mm M-38, 85 mm M-45 and 76 mm M-42 towed guns

Armour:

Tanks: T-34/85 (70). Soviet T-54 and its Chinese copy, T-59 (15). T-62 Chinese light tanks (possibly as many as 40)

APC: About 20, including BA-64, BTR-40 and BTR-152

SP gun: Soviet 76.2 mm SU-76 anti-tank

Missiles: SA-2 Guideline

RANK, DRESS AND DISTINCTIONS*Rank and Dress*

The Albanian army formerly wore Soviet-style uniforms and badges of rank. These now appear to have been replaced by Chinese-style tunics without badges of rank.

Distinctions

Numerous orders and decorations have been awarded to members of the armed forces. Some of these had Soviet equivalents, but it is not known how they have been affected by the break with the Soviet Union.

World Armies

CURRENT DEVELOPMENTS

It is difficult to assess the military consequences of Albania's current close relations with China. If fighting efficiency was damaged by the Russo-Albanian rupture, it has now probably recovered. The Albanian army remains, nevertheless, a relatively primitive and unsophisticated force consisting primarily of infantry. Small-unit actions are stressed in training, and it is likely that these, carried out in mountainous areas, could hamper the advance of an invader.

RICHARD HOLMES

ALGERIA

HISTORY AND INTRODUCTION

The Democratic People's Republic of Algeria was created by a prolonged military uprising against French rule in 1954–62, tying down half a million French troops at its height and costing up to a million Algerian lives. The armed forces, which have been the power base of Algeria's rulers since independence, claim this struggle as their accomplishment and (by inference) as their right to rule, but this is a considerable simplification of the actual history of the Algerian war.

Most of the senior members of the present officer corps, having gained their initial military experience as officers or NCOs in the French armed forces, joined the *Armée de Liberation Nationale* (ALN) which was created shortly after the Algerian rising of 1954 and was under the political control of the *Front de Liberation Nationale* (FLN), which set up an Algerian government in exile in Cairo in September, 1958. The ALN grew to number about 150,000 lightly armed men by independence in 1962. The great bulk of its forces were not involved in the fighting, however, being stationed along the frontiers of the neighbouring independent Arab States of Tunisia and Morocco, while the actual fighting was done by a fluctuating number of irregular 'internal' members of the ALN organised in six regional commands. Individuals were frequently transferred between the 'internal' and 'external' forces, but there was constant rivalry between the two leadership groups, the 'external' forces under their commander Colonel Houari Boumedienne claiming political leadership of the entire ALN.

Although French forces succeeded in re-establishing a large measure of control over Algeria during a brutal counter-insurgency campaign in the late 1950s, the political tolerance of the French public for the continuing high cost of the war in money and in conscripts' lives was steadily worn away. President De Gaulle originally came to power in France promising no surrender in Algeria but there was little French popular protest when he signed the treaty of Evian in 1962 providing for a referendum to determine whether or not Algeria was to remain a part of France. Algeria became independent later in 1962, and 1,000,000 French settlers — about one tenth of the population — left the country.

The simmering disagreements between the 'internal' and the 'external' wings of the ALN came to a head after independence was achieved. The FLN political leadership (previously based in Cairo) which had signed the Evian treaty, led by Ahmed Ben Bella, and the external wing of the ALN under Boumedienne vied for the allegiance of the commanders of the six regions into which the internal army was organised. When some proved reluctant to hand over the victory they felt they had been instrumental in winning to the external group which had spent the war outside Algeria's borders, recourse was had to the superior force of the semi-regular troops of the external army. In the autumn of 1962 Boumedienne sent 900 of his troops into Algiers, which was held by his adversaries, and the threat of full-scale civil war arose. In the end, however, a ceasefire agreement was signed which effectively acknowledged the primacy of the Ben Bella–Boumedienne faction.

Boumedienne was put in charge of the Defence Ministry and was appointed Commander-in-Chief of the Armed Forces by Ben Bella's government; one of his close associates was made Minister of the Interior. Boumedienne then embarked on a massive purge of the armed forces, in which he retained most of the officers who had previously served in the external wing of the ALN and dismissed or exiled a very large proportion of those associated with the internal wing. Only some 10,000 of the 50,000–60,000 men who had fought in the internal forces were taken into the *Armée Nationale Populaire* (ANP), as it was renamed in 1962, while the remainder (most of them Berbers) were demobilised.

During the first years of independence, personal rivalry and differences over policy led to a growing estrangement between the Commander-in-Chief of the Armed Forces and the Head of State; when Ben Bella tried to reduce the power of the military faction and to restore civilian control, he was ousted in a military coup led by Colonel Boumedienne in June, 1965. Boumedienne became President, and the army became the sole effective source of political power in the country, while the civilian political organisation of the FLN, though preserved, went into a steep decline. Ben Bella has been held under close house arrest for the last 15 years, but there has been no internal challenge to the regime since an opposing faction within the ANP was crushed during the crisis of 1967.

The armed forces have been maintained at roughly the same regular strength (60,000–70,000) since independence. National service has provided an additional conscript element since 1969, but most conscripts, after initial military training, are employed on non-military duties. The senior officers today are still for the most part Boumedienne's close associates from the days of the 'external' ALN, and real political power remains concentrated within a small circle of military officers despite the creation of a civilian and representative element in the government since 1976.

Algeria's domestic policies have been resolutely socialist throughout the period of independence, and its foreign policy has made it one of the leaders of the radical bloc in the Arab League, the Organisation for African Unity, and the Third World as a whole. During the 1960s and early 1970s it provided refuge, vocal support and sometimes actual aid to a wide assortment of guerrilla and revolutionary organisations and individuals, although in recent years it has shown more

World Armies

selectivity. It could be generally observed, however, that the Boumedienne regime's verbal radicalism has been tempered by a considerable degree of caution in practice. In the early years this was probably due primarily to Algeria's military weakness (it was humiliatingly defeated by Morocco in a brief border war in 1963) but in the more recent period Algeria's caution probably owes more to the exigencies of its economic strategy. With a population of 18,000,000 growing at a rate of 3.4% a year (i.e. 35,000,000 by the year 2000) and only very limited arable land in the Mediterranean coastal belt, Algeria has committed itself to a crash programme of industrialisation to provide jobs and prosperity for the next generation. It must also bear a very high educational expenditure (30% of the budget) to train the workforce for that industrialised future. It is a monumental task — 70% of the population is still on the land, and agricultural techniques are still traditional in much of the country — but substantial progress has been achieved: illiteracy, which was about 80% at independence, is planned to be entirely eradicated in the younger generation by 1980. But Algeria is now irrevocably committed to its policy of rapid industrialisation (there has been a classic flight from the land, and the urban population now numbers hundreds of thousands of youthful job-seekers) and this strategy depends critically on oil and gas exports to pay for the investments required.

The oil price-rise after 1973 has been of great help (the first development plan in 1970–73 included investments of \$8,000,000,000; the second plan, 1974–7, projected an investment of \$27,600,000,000, two fifths of it in heavy industry), but Algeria's main problem is that most of its exportable hydrocarbons are in the form of gas not oil. Its oil production has still not recovered from the 1973 peak of 51,000,000 tons, and oil reserves may run out altogether in the mid-1980s; on the other hand it has almost unlimited gas reserves.

The political repercussions of this arise from the fact that the developing infrastructure of gas-processing plants will cost \$28,000,000,000 in the years 1978–85, over half of which must be borrowed abroad, and the equally sensitive fact that the principal market for Algerian gas is the USA (which could go elsewhere for its gas). While it would be an exaggeration to say that these considerations have drastically altered the foreign policy of the Algerian government in recent years, it is nonetheless true that they would exercise a considerable restraining effect on any courses of action which might involve the direct commitment of Algerian armed forces in support of that policy. It should also be observed, however, that the prospect of continuously rising domestic prosperity (albeit from a very low level) would suggest that there is unlikely to be any early challenge to the armed forces' effective monopoly of political power in Algeria.

STRENGTH AND BUDGET

The Algerian armed forces total 78,800 men out of a population of 18,420,000. Of this total, the army has 70,000, the navy 3800 and the air force 5000. There are also 10,000 paramilitary gendarmerie equipped with heavy weapons including some 50 cannon-armed AML armoured cars, and a national service force of 6 month conscripts which is under the Ministry of Defence but is primarily employed in civic action projects. There are about 100,000 army reserves.

The military budget in 1978 was 1,840,000,000 dinars (\$456,000,000), a relatively modest share of the GNP of \$10,100,000,000. It was, however, a 17% increase on the previous year's military budget. The cause of the sharp rise in military spending is almost entirely the possibility of confrontation with Morocco over Algeria's support for the guerrillas who are attacking Moroccan and allied Mauritanian forces in the former Spanish Sahara which these two neighbouring States partitioned and annexed in late 1975.

COMMAND AND CONSTITUTIONAL STATUS

Colonel Houari Boumedienne, President, Head of State and Prime Minister since 1965, had been Defence Minister and Commander-in-Chief of the Armed Forces since independence in 1962. On his death in December, 1978 he was succeeded by Colonel Benjadid Chadli, who appears to be perpetuating the system. Twelve of the 17 cabinet members are colonels (although many of them have been engaged principally in civil, political and administrative tasks for years) and the *Sûreté et Gendarmerie* are controlled by two close associates of Boumedienne, Colonels Draia and Bencherif. Day-to-day command of the army is the responsibility of the Secretary-General of the Ministry of National Defence.

The General Staff, created in 1964, has responsibility for the organisational, mobilization, budget and employment planning of the four armed services (including the National Gendarmerie). The formal organisation for the general control of armed forces operations is the Higher Council of Defence, consisting of the President and Minister of National Defence (both Boumedienne), the Ministers of the Interior and Foreign Affairs, and the Chairman of the Committee of National Defence in the National Assembly and two other members designated by the President; but in practice the President deals directly with the commanders of the armed forces and of the five military regions.

The armed forces have FLN party cells at all levels, and an elaborate organisation of political commissions reporting to the Political Commissariat at the Ministry of National Defence, commanded by Lieutenant-Colonel Hadjeres El-Hachemi. This organisation is subordinate to the Political Bureau of the FLN.

In the last few years a considerable constitutional superstructure has been created for the regime. A 60,000 word document entitled *The National Charter*, which is 'the source of ideological, legal and political reference for the institutions

of the party and State at all levels' was widely debated and substantially amended — indeed, criticism got a bit out of hand — before being approved by a national referendum in June, 1976. This was followed by a referendum (without prior public discussion) in November, 1976 on a constitution granting all executive powers to the President, and effectively rendering the new Popular National Assembly a rubber stamp. In accordance with the constitution, President Boumedienne was elected to a renewable 6 year term of office in December, 1976 (he was the only candidate and received 99.95% of the valid votes), and parliamentary elections for the new 261 member assembly followed (only the FLN ran candidates) in February, 1977. There is no evidence that any of this altered the actual focus of political power and control over the armed forces in Algeria.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

The principal roles of the Algerian armed forces remain the governing of the country and the protection of the regime. They do have a secondary role of external defence, however, and this has been increasing in importance since the commencement of the confrontation with Morocco over ex-Spanish Sahara in 1975. The military budget has risen sharply, and there has been a considerable concentration of forces near the Moroccan frontier, especially in the south near Tindouf, where the military airfield's runway has recently been lengthened and strengthened, and MiG-21s brought in.

The conflict with Morocco dates from the beginnings of Algerian independence, and springs not only from the diametrically opposed political characters of the regimes but also from serious border disputes. The latter are particularly sensitive in the south, where the historical accident of administrative boundaries within the French colonial empire has given Algeria the lion's share of the Sahara, including extensive areas that were more usually under Moroccan control or influence. This dispute led to a sharp border war (fought mainly in the south round Tindouf) in October, 1963 in which the new Algerian army, trained only in guerrilla tactics, was soundly beaten. Subsequent attempts to settle the borders by negotiation never achieved ratification, and during the early 1970s Algeria was accused by Rabat of being implicated in several attempts on King Hassan's life.

The current tension was caused by the secret agreement of 1974 between Morocco and Mauritania for the partition of the Spanish colonial territory of Western Sahara which lay between them. The local population of less than 100,000, whose guerrilla organisation, Polisario, was already getting arms and bases from the Algerians in its struggle against the Spanish, was strongly opposed to its partition. When Spain concurred with the Moroccan-Mauritanian partition plan for the colony in November, 1975 the deal was denounced by both Polisario and Algeria. Guerrilla operations from Algerian bases around Tindouf began against Moroccan and Mauritanian occupation troops, and in March, 1976 Algiers formally recognised the government-in-exile of the Saharan Arab Democratic Republic. Both Morocco and Mauritania thereupon severed diplomatic relations with Algeria.

The guerrilla war since 1976 has been fought mainly in the territory of the former Spanish colony and in Mauritania itself, although Polisario also raids into southern Morocco. It has succeeded in tying down up to a third of the Moroccan army, and has brought Mauritania to the brink of economic collapse, with constant raids on the communications links joining its few mines to the sea. Despite the ten-fold expansion of the Mauritanian army within 5 years, it became necessary in late 1977 for Morocco to send a number of troops to the aid of its ally. In mid-1978 Moroccan troops in Mauritania were officially stated to number 9000 (and unofficially estimated at 15,000), and Rabat itself was feeling the strain of the war.

Morocco has made it clear throughout the crisis that it regards Algeria as almost solely responsible for the activities, and even the existence, of Polisario, and has repeatedly raised the possibility that it might cross the Algerian border in the course of 'hot pursuit'. Algerian troops have therefore been redeployed into the threatened areas, and the tenuous lines of communication between thickly populated coastal Algeria and the flashpoints of the south-west border region near Tindouf are being systematically improved. The Algerian armed forces are also reportedly acquiring new arms in large quantities, particularly from the Soviet Union.

In a war between Morocco and Algeria which was largely confined to the south, it is unlikely that either side would gain a decisive advantage given the present levels of forces and the state of the communications in the area. Should one side or the other begin to make substantial advances, however, it is very possible that the other might expand the conflict to the narrow densely settled coastal plain along the Mediterranean. The deployment of the full strength of the two countries' armed forces in the area might have the most serious consequences.

The Algerian armed forces have had no operational experience since the brief 1963 war. A battalion of infantry and a squadron of MiG-21s were sent to Egypt during the 1967 war, but the troops saw no action and eventually returned home (six MiGs were reportedly lost). Algerians proved themselves ferocious and capable fighters during the war of independence in 1954-62, when less than 50,000 of them succeeded in tying down half a million French troops, but that was a different kind of war and offers little guidance as to the organisational and operational capabilities of the present Algerian armed forces.

The army is extensively employed in civic action projects (especially the engineers and the conscript elements). Algeria has no external defence commitments, although it does maintain a close political relationship (that could conceivably have some military implications) with Libya.

World Armies

The headquarters of all four armed forces are in the Ministry of National Defence in Algiers. Army bases are widely distributed throughout the country, with garrisons in all major cities and towns.

The principal navy base is at Mers-el-Kebir. Other naval bases are at Algiers, Annaba (Bône), Oran, Arzew, Batna, Philippeville and La Senia.

The main air force base is at Dar-el-Beida, near Algiers. Other major bases are at Boufarak, Paul-Cazelles, Marine, Oukar, Biskra, Algiers, Oran and Sidi-bel-Abbes. There are 30 additional medium air fields and about 20 minor ones in the country.

ORGANISATION

Arms of Service

The army contains the usual infantry, armoured, engineer and artillery arms, and the full array of services. The navy, air force and gendarmerie are separate forces.

Operational

The principal type of unit is the independent infantry battalion, of which there are fifty, but the army also contains one armoured brigade, three independent tank battalions, four motorised infantry brigades, 10 independent artillery battalions, a paratroop battalion, five anti-aircraft artillery battalions, three engineer battalions and 12 companies of desert troops.

Since March, 1964 the original seven territorial military commands (*wilayas*) have been reduced in number to five larger ones, with headquarters as follows: Region I, Blida; Region II, Oran; Region III, Béchar (Colomb-Béchar); Region IV, Ouargla; and Region V, Constantine. Each region is commanded by a colonel who is directly subordinate to the Minister of National Defence rather than to the General Staff.

The air force has a squadron organisation.

RECRUITMENT, TRAINING AND RESERVES

Recruitment has never been a problem for the ANP, which is invariably oversubscribed with volunteers. The core of the army consists of regular troops, but compulsory conscription of male Algerians for a period of 6 months at the age of nineteen was instituted in 1968, primarily for nation-building and morale purposes. The conscripts spend much of their time on civic action projects. Preliminary military training in secondary schools and universities was instituted in November, 1967.

In the early phase of its conversion from a guerrilla force to a regular armed force in the early 1960s, the Algerian army was heavily dependent on foreign training assistance, and sent most of its officers abroad for military instruction. In line with its political orientation, Algeria took most of this aid from the Soviet Union or from the then-radical Egyptian government, although the French continued to make a large contribution to the training of the air force and gendarmerie.

Thousands of Algerian officers were trained in the Soviet Union in the 1960s, but most officer instruction is now done at home. The military college at Blida gives a 3 year course for army officers, and the air force academy at Tafraouine near Oran, founded in 1967, offers a course of similar length for air force officers. Flying training, previously carried out in France, has been established at Bou-Sfer (near Mers-el-Kebir) since 1970, but operational training is still done with Soviet assistance. Technical training for NCOs is provided at a school in Blida. There are now fewer than 1000 Soviet experts and only a couple of hundred French military personnel in Algeria lending training assistance.

Reserves are estimated to number up to 100,000, but no details are available on their organisation or state of readiness.

EQUIPMENT AND ARMS INDUSTRY

Algeria inherited a good deal of French arms and equipment in 1962, but almost all its subsequent arms purchases have been from the Soviet Union, with the result that 90% of its weapons are now Russian-made.

The Algerian army's main armoured strength consists of 350 T-54/-55/-62 medium tanks, supplemented by 100 older T-34s and 50 French-made AMX-13 light tanks. There are also a number of AML armoured cars, and 440 BTR-40/-50/-60/-152 and Walid APCs for the motorised infantry. The army's artillery strength is particularly great, consisting of 600 85 mm, 122 mm and 152 mm guns and howitzers, and 85 SU-100 and ISU-122/-152 self-propelled guns, all of Soviet manufacture.

Other major weapons possessed by the army include 80 120 mm and 160 mm mortars; 14 FROG-4 surface-to-surface missiles; 20 140 mm and 40 240 mm rocket launchers; Sagger ATGWs; and 57 mm, 85 mm and 100 mm AA guns.

The nucleus of the air force was five MiG-15s delivered in 1962 by the Soviet Union. The air force now has 204 combat

aircraft, made up of three interceptor squadrons with 90 MiG-21s; four fighter-ground attack squadrons with 20 SU-7BMs (two squadrons), 30 MiG-17s (two squadrons) and 20 MiG-15s; two light bomber squadrons with 24 Il-28s; and one COIN squadron with 20 Magisters. There are also two transport squadrons equipped with eight An-12s, 10 F-27s, four Il-18s and four Il-14s, and a helicopter wing of four squadrons employing four Mi-6, 42 Mi-4, 12 Mi-8, six Hughes 269A and five Puma helicopters. The training wing has MiG-15/-17/-21 UTIs, Su-7Us, Yak-11/-18s, and three Beech Queen Airs and four Beech King Airs. In the past few years SAM units have been formed in the air force equipped with SA-2 missiles.

The navy's main strength lies in missile-armed fast patrol boats: it has six Komar, three Osa I and four Osa II FPBGs armed with Styx SSMs. It also has 10 P-6 torpedo boats, six SO-1 submarine chasers, two fleet minesweepers of the Soviet T-43 class, one LST (Polnocny-class), and 10 small Italian-built coastal patrol boats.

The gendarmerie is also equipped with combat weapons, including about 50 cannon-armed AML armoured cars.

There is no Algerian arms industry of any consequence, but the armed forces do by now have a considerable capability for maintenance and repair.

The confrontation with Morocco has caused Algeria to consider whether its equipment inventory is adequate, in view of the very rapid expansion of the Moroccan armed forces since 1975. It is believed that new arms purchases from the Soviet Union were discussed during the visit of the Soviet Chief of Staff, Marshal Nikolai Ogarkov, in December, 1977.

RANK, DRESS AND DISTINCTIONS

One of the most striking characteristics of the Algerian army is that it has one of the least inflated rank structures in the world. The rank of general exists, but nobody has actually been promoted to it since independence; the highest rank actually held is that of colonel, which is borne only by the Minister of National Defence, the commanders of the five military regions and some General Staff officers. There are, altogether, only about 50 field-grade officers at the top of an extremely broad rank pyramid numbering about 150 captains and 2000 lieutenants. Great reliance is placed on the large category of warrant officers.

ANP ranks, their English equivalents and the insignia of rank are given in the following table.

<i>ANP</i>	<i>Equivalent</i>	<i>Insignia</i>
Liwa	General	Not known, as none exists
Sagh el Tani	Colonel	Crescent device and two stars
(not known)	Lieutenant-colonel	Crescent device and one star
Sagh el Aouel	Major	Crescent device
Dhabet el Tani	Captain	Three stars
Dhabet	Lieutenant	Two stars
Moulazem el Tani	Second-lieutenant	One star
Moulazem el Aouel	Cadet	One star of contrasting colour to the buttons
(not known)	Chief Warrant Officer	Golden 'V' over three bars
Moulazem	Warrant Officer	Golden 'V' over two bars
Arif el Tani	Sergeant First Class	Golden 'V' over one bar
Arif el Aouel	Sergeant	Golden 'V'
Djoundi el Aouel	Corporal	Two diagonal red stripes
(not known)	Private First Class	(not known)
Djoundi	Private	None

In practice, the ranks equivalent to lieutenant-colonel, chief warrant officer and private first class are not filled. The uniforms adopted by the Algerian army, navy and air force in 1964 bear a close resemblance in style and pattern to those of the United States armed forces.

Pay for armed forces personnel compares favourably with that of men with similar qualifications in civilian life. There is provision for health care, and disablement and retirement benefits, although details are not available. The army finances much of the expenses out of the profits of its own co-operative establishments making clothes, shoes and furniture. The army is, indeed, the biggest single employer in Algeria, providing work for over 30,000 civilians as well as employing 7000-8000 of its own members in running these co-operatives.

CURRENT DEVELOPMENTS

There is no reason to doubt the stability of the present regime in Algeria or of the military hierarchy on which it fundamentally depends. Most of the ANP's relatively small cadre of senior officers have similar backgrounds — service in the French army as officers or NCOs, followed by years in the 'external wing' of the ALN — and have been closely associated with Colonel Boumedienne for two decades. Political opposition movements are not permitted to function, and both the army and the State apparatus are pervaded by an efficient security network.

World Armies

Algeria's status as a radical both within the Arab League (where it is a mainstay of the 'Rejection Front') and the Organisation of African Unity (where it is one of the core members of the developing coalition of 'progressive' States) is unlikely to change, but neither is its reputation for caution in action. The one issue which might lead it into a military clash, or even all-out war with Morocco, is the question of the former Spanish colony of Sahara, where it has granted support and bases to the Polisario guerrillas fighting against the Moroccan and Mauritanian partition of that territory, and has given recognition and a home to the Saharan government-in-exile. Algerian anger at Spain's complicity in the partition agreement has also caused it to give facilities to the MPAIAC, the secessionist movement seeking independence for the Canary Islands, and this has led to a marked cooling of relations with Spain, but no open conflict is likely on this account.

In the case of the Sahara, Algeria's initial enthusiasm for the Polisario cause was considerably dampened by the Moroccan military successes of 1976-7, when Polisario's strategy of striking at the much weaker partner in the partition deal, Mauritania, was thwarted by the despatch of up to 15,000 Moroccan troops (official sources admit to 9000) and French fighter-bombers to Mauritania's aid. In early 1978 the Algerian press had ceased to dwell on the Saharan conflict, the representatives of the Saharan Arab Democratic Republic were considerably less visible in Algiers and there was talk of a negotiated settlement or simply a gradual fading away of the war. In July, 1978 however the Mauritanian government was overthrown by an army coup whose leading figures were suspected of wishing to escape from Moroccan influence, withdraw from Mauritania's share of the Sahara and end the war which had crippled Mauritania's economy. While Polisario at once responded by declaring a unilateral ceasefire to apply to Mauritania only, this development paradoxically put new heart into the Algerians to continue the confrontation with Morocco, in view of the possibility that Morocco's ally would seek to withdraw from the conflict or even to change sides.

This has also considerably increased the risk of a direct Moroccan-Algerian clash, since it is doubtful whether the large number of Moroccan troops in Mauritania would permit such a change, while some Mauriticians might actively seek Algerian aid to evict the Moroccans. If such a conflict occurred, the better Moroccan lines of communication in the far south would give Rabat a considerable advantage, although this is to some extent offset by superior Algerian air strength.

ANGOLA

HISTORY AND INTRODUCTION

Angola attained independence from Portugal in 1975 amid civil war conditions. The Zaïre-based FNLA, a non-Marxist resistance movement formed largely from the Bakongo people, stood in alliance with UNITA, an eastern Angolan insurgency movement supported by Zambia; both were in conflict with MPLA, a Marxist resistance movement, and the first to appear in Angola. The MPLA drew its support from a number of the *mestiço* community, the urban African population of Luanda (and some white working-class elements as well) and some sections of the Ovimbundu people. The Chinese supported the FNLA, a factor which appears to have influenced the decision of the USSR to intervene jointly with Cuba in favour of the MPLA. South Africa briefly supported UNITA, but its military intervention appears to have followed the USSR's decision to participate, contrary to much widely held popular belief. The 14,000 Cuban troops, together with considerable quantities of Soviet equipment, enabled the MPLA to gain a victory early in 1976. After the victory, the Cubans started to reduce their numbers; various crises in Angola have, however, led to their reinforcement to a little over the 1976 total. These crises have been the general unpopularity of the MPLA regime in the rural areas, a specific coup attempt in May, 1977 and considerable resumed UNITA activity in the east of Angola.

While the UNITA campaign (described later) is presenting the regime with the early symptoms of a wasting disease of the limbs, the April, 1977 Luanda events were a near-fatal cerebral haemorrhage. The plot, to oust Neto, was the work of Angola's first Minister of the Interior, Nito Alves, and an army regional political commissar, J. Van Dunem, supported by a number of other senior political figures and FAPLA (army — see later) officers. The quick suppression of the plot, and its failure to set off general uprisings in the streets, should be seen as a measure of the fear in which the regime is held rather than any popularity or even acquiescence. The major consequence, for the army, was an increased representation in the MPLA Congress Central Committee and its important Political Committee. For the country the attempted coup was followed by a large number of arrests of alleged '*nitistas*' and a heavy reassertion of the supremacy of the party, and President Neto, over all institutions of economic and national life.

STRENGTH AND BUDGET

Population: 6,000,000 (approximately)
No other information is available at present.

COMMAND AND CONSTITUTIONAL STATUS

A people's liberation army (FAPLA), drawn largely from MPLA cadres is in the process of formation. There is also to be a barrack police force, a Workers' Militia (ODP), and a security service (DISA). President A. Neto is Commander-in-Chief of all armed forces. The Minister for Defence is M.I. Correira. The ODP is commanded by J.M. Paira.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

FAPLA units participated in the final stages of the civil war, in general operating in the northern zone. Angola now claims to see a three-prong military threat. The first of these, and rated potentially the most serious, is the UNITA activity in the south-east, with its threat to the Benguela railway, which was cut or interfered with incessantly in 1977. UNITA attacks were mounted on Cuangar, Pereira d'Eca, Cahira, Nova Sintra, Chipeta, Kamakupa, Kuanza, Chinguar, Kutatu, Vila Nova, Bela Vista, Vila Flore and Ganda. UNITA also appears to have shot down an Angolan transport aircraft in July, 1977; casualties were admitted by Luanda throughout the year. Luanda alleges South African support for UNITA; the supply, via discreet intermediaries, of weapons to the insurgents both by South Africa and by Zaïre, is very likely. Some clandestine Zambian support is also probable. West German and French financial support for UNITA has also been rumoured and is not improbable. UNITA is able to claim that it is truly African; in contrast the Luanda regime is a new Cuban *mestiço* colonialism; one of its main sources for recruits is FAPLA deserters, some arriving with weapons. The second commitment is on the Zaïre frontiers: this is in part the continued suppression of FNLA and the FLEC (a Cabinda enclave local insurgent movement) neither of which has been totally destroyed, and in part a game of raids played by both sides across the Zaïre border, the aims of which are to cause political embarrassment and expense to the other side. The

World Armies

Angolan-Cuban-supported invasion of Shaba province in March, 1977 was the most dramatic move in this game, but other moves, by both sides, have been reported and still continue. The various salients of the border offer opportunities to both sides. The third commitment is on the (Namibian) border with South Africa. At present little direct activity seems to take place in this area, apart from Angolan support for SWAPO insurgents (together with attempts to prevent them terrorising Angolans); a danger from South African 'hot pursuit' does, however, exist. Luanda has alleged South Africans living across the border, but this seems unlikely.

In all these activities Cuban units participate and would seem to be the winners of such Angolan success as is achieved, the FAPLA achieving very little. Even the Cuban units should not, however, be overrated on purely military grounds: the South African army's much inferior forces operating briefly in Angola in 1975 found them indifferently trained and led, with little idea of the reasons for their presence, and in some encounters a marked instinct for self-preservation.

ORGANISATION

It is reported that FAPLA is to be composed, eventually, of a tank regiment, eight or nine motor-rifle regiments, a special force unit and a surface-to-air missile regiment to protect the capital.

Under Cuban advice the country has been divided into six military regions: north, east, central and west, Luanda, south and Cabinda.

The intended final strength of the army is 28,000.

RECRUITMENT, TRAINING AND RESERVES

Conscription is used, but only in areas and from communities over which the government has authority and whose soldiers, it is hoped, will prove reliable. A number of officers are coastal *mestiços*.

Numbers of Cubans and Russians are employed in training and administration. A major problem facing the regime as a whole and the army in particular is the acute shortage of skilled labour and men with any form of technical training; so many in these categories (Portuguese *mestiços*, blacks and others) departed in 1974-5. A 20 year treaty of friendship with the USSR was signed in 1976. The details of this treaty were not published, but it is believed that they provided for massive aid in return for permanent Soviet maritime reconnaissance and naval installations.

Some East German military aid, largely medical, has also been reported.

EQUIPMENT AND ARMS INDUSTRY

Almost the entire range of Soviet divisional equipment except for artillery Frog missiles has been reported in Angola, though generally of older marks. It is quite impossible to assess either the quantities or the ultimate destination — a pattern of present use by the Cubans and future transfer to the FAPLA, seems probable. The range includes the usual Soviet small arms and infantry rifles, light and heavy machine-guns, mortars and anti-tank rocket launchers, carbines and grenades, T34, T54 and PT76 tanks, BRDM and BRDM2 armoured cars, BTR40 and BTR152 APCs, some Czech OT62 vehicles, 100mm and 122mm guns, BM21 multi-barrelled rocket launchers, 76mm anti-tank guns, 23mm and 37mm anti-aircraft guns, SAM-7s (Grail), K61 amphibious load carriers and Sagger ATGWs.

The small air force is equipped with a squadron each of MiG-17 and MiG-21 aircraft, communication and transport aircraft, and helicopters.

In addition to the Soviet equipment, and in particular among the transport aircraft and helicopters, a few items of NATO countries' equipment purchased by Portugal prior to 1974, are still in use.

RANK, DRESS AND DISTINCTIONS

No information was available at the time of writing.

CURRENT DEVELOPMENTS

Despite their common dislike of President Neto, it is unlikely that UNITA's leader, J. Savimbi, will seek any close alliance with the reforming FNLA; ethnic differences remain great. The possibility of Neto seeking a *rapprochement* with Savimbi (with perhaps the Soviets acting as a broker) is not a totally unreal one, although, at the moment, UNITA's stated aims are a secession State in the east. Such a *rapprochement* would almost certainly have to meet Savimbi's strong desires for the departure of the Cubans; this in turn could provide Neto with an excuse to ask for their departure, a gesture which would

gain him some much-needed popularity. Soviet interests are likely to remain those of maintaining a moderately friendly regime — not necessarily Neto personally — that will continue to allow them to operate permanent air and naval facilities. In return for this they would be willing to supply aid, both civil and military. Certainly if President Neto wishes to gain some measure of popular support for his regime he will have to move beyond the present narrow base of the Luanda proletariat and Cuban garrisons.

L. L. MATHEWS

ARGENTINA

HISTORY AND INTRODUCTION

The Argentinian army, after the Brazilian the largest in South America, is a national and to some degree an international institution of the greatest significance. In its modern form it is of comparatively recent origin. But its predecessors were instrumental in expelling the Spanish colonial government from the country, in helping to liberate neighbouring Chile and Peru, in establishing Uruguay as an independent State and in preserving the power of the central government during long years of provincial turbulence. In modern times the army has played a cardinal political role in national affairs. From its ranks issued the most important and influential politician of twentieth century Latin American history, Juan Perón, whose ideas and achievements made their effects felt far beyond the continent. His fall from power, which the army itself brought about, has consigned the nation to endemic political crisis, and obliged the army to arbitrate at frequent intervals between those loyal to the political tradition he established and those who seek to control or reverse its revolutionary implications. As a result the army has acquired, perhaps unwillingly, a reputation as the most political in modern Latin America. At the same time it most nearly approaches European standards of military efficiency, professional autonomy and universality of conscriptive obligation.

The first Argentinian military force was raised by the citizens of Buenos Aires to repel an invasion force sent by the British in 1806 after Spain had made alliance with Napoleon. Their two victories, known today as the *Reconquista* and the *Defensa*, are celebrated as national events because, though serving the immediate interests of Madrid, they demonstrated to the Buenos Aireans the power they possessed to determine their own affairs and led directly to the overthrow of the Spanish administration in 1810. The Spaniards retained forces in the north and west of the Vice-Royalty of the Río de la Plata, however, against which Buenos Aires had to send troops, but they failed to win for the future State those parts of the territory now known as Bolivia, Paraguay and Uruguay, the inhabitants of the latter region securing independence for themselves both from the Argentinians and the Portuguese in Brazil. It was not until the arrival of San Martín in 1814 that effective measures were taken to tackle the remaining centres of Spanish power. San Martín's Army of the Andes, largely Argentinian in composition, crossed the mountains in January, 1817 and 4 years later completed the liberation of the continent.

The Argentinians' part in this historic achievement would help eventually to establish them as the dominant nation of the south. But they could not begin to play that role, nor to function as an effective political society, until they had achieved their own unity. Argentina was, as to some extent it still remains, two lands in the 1820s, a vast hinterland (*campo*) over which the seaward-looking citizens (*portenos*) of Buenos Aires exercised only very tenuous authority. It was indeed not even formally a centralised State, but a loose federation of provinces for dominance in which the *unitarios* of the 'port' and the *federales* of the 'camp' were to struggle for the next 40 years. It was not until the defeat of the provincial armies in 1861 that Argentina became a united republic. And even thereafter the provinces could find the men to wage civil war as late as 1880. But by then the national army, which in an embryo form had already fought wars against the Brazilians in the 1820s and against Paraguay in 1865–70, was too strong to be overcome from within. Within a generation its loyalty was to become the most prized political possession in the State.

The rise of the army as a modern institution may be taken to date from the creation of the Military Academy (*Colegio Militar de la Nación*) in 1869. Like most Latin American armies of the period, it had hitherto been officered by political appointees and soldiers of fortune. By 1896, however, when the Academy produced 122 second-lieutenants, entry to the officer corps was closed to non-professionals and within a decade almost all of its members, who numbered about 1700 in the period 1900–30, were Academy trained. This professionalisation of the officer corps was very much the achievement of General Roca, president between 1880 and 1886 and again from 1898 to 1904. A former minister of war and victor of the 'War of the Desert' (1879–83) against the Indians of the south, he also, during his second presidency, saw through the law which would transform the enlisted ranks of the army from an erratically recruited collection of regiments to a nationally conscripted force. This Ricchieri Law, so called after Roca's minister of war, obliged all twenty-year-olds to register for military service, selection to be made by a lottery. The term fixed was 1 year in the army, 2 years in the navy. The proportion enrolled from each annual contingent averaged about a third before 1914, but was still higher than that imposed in most Latin American countries and was reasonably socially representative, since grounds allowed for exemption were restricted.

Modernisation did not stop there. Like Chile during the same period, Argentina turned to Germany for help in the higher training and organisation of its army. A staff college (*Escuela Superior de Guerra*) was opened in 1900. Its director and four of its 10 professors were German officers. At the same time, Argentinian officers began to be sent to Germany to study in military schools or serve in German regiments, and Uriburu (later president), one of the most outstanding of this group, was, as Inspector General from 1923, to employ a German general (Faupel) as his personal adviser. German advisers were to

remain with the army until 1940, making it both in outward appearance and in doctrine almost as Prussian an institution as the Chilean.

Unlike the Chilean however, the Argentinian army was from the outset of its development as a modern, professional institution, to be drawn into national politics, at first partially and sporadically but later wholeheartedly and continuously. Its modernisation coincided with very large-scale immigration from Europe, particularly from Italy and Spain, which was to raise the population from under 2,000,000 in 1870 to 4,000,000 in 1895 and to nearly 8,000,000 in 1914. This influx put the traditional ruling class under very heavy pressure, which manifested itself in the rise of a mass radical movement. A revolt against the Buenos Aires government in 1890 attracted military support in the provinces but was put down, as was another in 1905, which also commanded military support. The leader of the radicals, Yrigoyen, who was eventually elected to the presidency on an extended franchise in 1916, frankly solicited military support among the young modernising officers and rewarded those who had assisted him when he eventually achieved power, a foretaste of the fruits of political influence which the officers were not to forget. Those outside Yrigoyen's circle formed in 1921 an Argentinian version of those 'lodges' so prevalent in Latin American military circles, the Logia de San Martín, used the strength it gave them to impose their own choice as minister of war on Yrigoyen's successor and, when Yrigoyen was re-elected in 1928, to work for his downfall. It was in fact brought about in 1930 by an opponent of the San Martín Lodge, Uriburu, but the San Martín faction eventually succeeded in capturing the presidency for their candidate, Justo, at the elections of 1932.

Justo represented the anti-radical tendencies present both in the army and in civilian politics and ruled so selfishly that the period of his presidency and that of his successors has been called the Infamous Decade (1932–43). Effective opposition to his rule took the form not of a left-wing movement, however, but of a corporatist nationalism called 'integral nationalism', which borrowed many of its ideas from Mussolini's Italy and had important support among a group of army officers eventually known as the GOU (*Grupo de Oficiales Unidos*). Their leading light was Colonel Juan Perón, who had recently served as military attaché in Italy, and had taken a part in the coup of 1930. Deeply committed to corporatist ideals, conscious of the 'new' Argentinians' rejection of their immigrant fathers' socialism, fanatically nationalist, he used the position brought him by his part in the coup of June, 1943 which overthrew the conservative regime, to establish himself as a demagogic leader of the working class. That position was head of the department of labour and social security, which he quickly turned into the key ministry of the government. Through his influence over a succession of military presidents, he secured funds to create an advanced social-security system, financed out of the enormous revenues which Argentina's agriculture was earning in the international war economy, and so to ingratiate himself with the more powerful unions, to which he granted extensive legal bargaining powers. Meanwhile the military government attracted intense internal and external dislike for its open siding with the Axis. When the disgruntled officers of the Campo de Mayo garrison (the principal military station outside Buenos Aires and the usual breeding ground of coups) attempted to vent their frustration by demanding and achieving Perón's dismissal on October 9th, 1945 he appealed directly to his working-class followers (the *descamisados*) and 8 days later was triumphantly welcomed back by them from the custody in which he had been placed. In February, 1946 he was elected president by an overwhelming majority.

There followed 10 years of *Peronismo*, rule by President Perón in the spirit of what he called *Justicialismo*. The doctrine was not, as he claimed, an original one: its slogans were 'political sovereignty, economic independence, social justice'. But, in a country dominated economically by foreign investors and circumscribed diplomatically by the United States, and where many of the workers of town and country remained desperately poor among abundant natural riches, it had appeal, and all the more because Perón strove to give it substance. His continuing support of the trade unions and largesse to the social-security system coincided in the late 1940s, however, with worsening terms of trade, and so resulted in serious inflation and a halt to industrialisation. The latter programme had woken wide support in the army, which was committed to a policy of self-sufficiency in military equipment. Disappointment at this stagnation, alienation from the increasingly civilian entourage of the president and outrage at the nomination of Perón's wife, the magnetic Evita, as vice-president led in September, 1951 to a military and naval rebellion. Easily suppressed though it was by loyal troops, Perón used his authority, reinforced by his re-election in November, to purge both the navy and the army.

Economic conditions in his second term heightened his difficulties, however, forcing him to make concessions to the industrial and commercial classes and to sustain the momentum of his movement largely by a public quarrel with the Catholic Church. He was aware that this quarrel fed the hostility of many officers, who were ideologically (if not always spiritually) Catholic in outlook, and he attempted to reinsure himself against military rebellion by fostering the creation of militant union militias, though only after an abortive naval uprising in June, 1955. But the threat of a breach of its monopoly of arms was exactly that calculated to unite an army still deeply divided between pro- and anti-Peronistas, and on September 16th, exactly 3 months after the naval revolt, a major military and naval rebellion, against which even the remaining loyal units around Buenos Aires would not stand, brought Perón down. He resigned his functions to a military *junta* and retired first to Paraguay, later to Nicaragua and then to Spain.

This so-called 'liberating revolution' had been the work of armed factions rather than of the armed forces as a whole, notably the Córdoba garrison and the navy's marine fusiliers, a force ironically created by Perón to imitate the U.S. Marine Corps. And after two months' of united support for the new military president, Lonardi, the factions reappeared. The navy and a strong group of anti-Peronistas in the army, later to be known as the Reds (*colorados*) overturned Lonardi and installed in his place an anti-Peronista general, Aramburu, whose policy for the extirpation of Peronist influence in the country was to restore elective constitutional government. He dealt harshly with a Peronist military uprising in June, for the first time in

World Armies

Argentinian history sending numbers of officers to the firing-squad. As a result, there was no opposition to his calling of elections in 1958, which returned a radical, Frondizi, to the presidency. Frondizi aimed to reintegrate the *Peronistas* into political life, and at the same time to cure Argentina's economic difficulties by a policy of encouraging foreign investment and the exporting industries. The results were to swing popular support to the intransigent *Peronistas*, whose gains at the provincial elections of 1962 were so great that the army dropped Frondizi and replaced him with an interim president until new elections could be held. These, in July, 1963 returned another radical, Illia. He inherited Frondizi's economic problems and persisted in his policies, particularly that of attempting to win back the *Peronistas* to constitutionalism, but without success. In June, 1966 the army, in which the faction known as the Blues (*azules*) (who shared Frondizi's and Illia's belief in the necessity of winning the *Peronistas* back to constitutionalism) were now dominant, lost faith in Illia's prospects, overthrown him, and put the leader of the Blue faction, General Onganía, in power. His economic policies, even more deflationary in their effects than his predecessors had been, provoked a major popular uprising centred on Córdoba (the *Córdobazo*) in May, 1969 and the reverberations of the revolt led to the removal of his minister of economics, Vasena, and to the outbreak of terrorist outrages staged by left-wing groups, among which the left-wing Peronist *Montoneros* and the communist ERP (Popular Revolutionary Army) were to become the most prominent.

Uncertain about the economic future, the army vacillated for some months and then in June, 1970 replaced Onganía with General Levingston but found him an unsatisfactory substitute. In March, 1971 he was removed and General Lanusse installed in his place, with a stated commitment to introduce constitutional elections. By then, however, Perón, who had once before attempted to re-enter the country, had become an active force in national politics. His nominee, Campora, was returned at the presidential elections of May, 1973 and in the next month Perón came home. Campora at once stood down and Perón was elected in his place, with his second wife, Isabel, as vice-president. He proved to have no easy solutions either to the country's economic problems or to the growing menace of terrorism, which was mounted by groups which had now moved far to the left of the position he was prepared to support. Moreover, his health was failing. On his death in July, 1974 he was replaced as president by his wife, who took advice from Perón's former secretary, Lopez Rega. The army was prepared to lend her its support but not to tolerate the growing tide of violence, which was directed both against army installations and individual army officers. In December, 1975 an air force rising was put down but in March, 1976 the army, exasperated by economic chaos and the virtual breakdown of law and order, deposed President Isabel Perón and transferred executive and legislative power to a *junta*, with General Videla, the army Commander-in-Chief, as President.

STRENGTH AND BUDGET

Population: 26,045,000

Army: 80,000

Navy: 32,900; 17 major warships, 57 smaller

Air force: 17,000; 46 combat aircraft

GNP (1976 estimate): \$52,100,000,000

Defence expenditure (1977): \$1,420,000,000

Information on defence spending is scarce, and has become scarcer since the army's return to power. As a proportion of the national budget, it has fluctuated about 12% for some time, but has been held down by the receipt of much American military aid.

COMMAND AND CONSTITUTIONAL STATUS

Argentina is a presidential republic, the President being elected by direct popular vote, and having powers to introduce his own legislation into the elected Senate and Congress. The provinces elect their own governors and legislators, but the President possesses powers to intervene in provincial affairs, either by the appointment of presidential *interventores*, or by the imposition of a state of siege (under Article 2 of the Constitution) which may be applied to the whole or part of the country. The President is Commander-in-Chief of the Armed Forces, but exercises control of them through the War, Air and Navy Ministers, who are serving officers.

The last legally installed President was Isabel Martinez de Perón, widow of General Perón, from whom she took over power on his death. Following widespread internal violence, severe economic difficulties, and her suspension of Congress to prevent her impeachment, the army removed her from office on March 24th, 1976 and declared that power had passed to a *junta* composed of the heads of the three services.

The *junta* announced that it would remain in power for 3 years. Meanwhile it dissolved Congress, the provincial legislatures and city councils, dismissed the provincial governors and interventors, suspended the activities of all political parties, trade unions and employers' and professional associations, decreed the continuation of the state of siege imposed in November, 1974 (and extended indefinitely in March, 1975), prohibited public meetings and the dissemination of 'alarmist' news and warned workers that they would be punished for absenteeism. On March 25th, the *junta* further

announced that it would be the supreme organ of the State, would be responsible for choosing the President, Judges of the Supreme Law and the Attorney General. The head of state was to be a minister of the armed services (General Videla, Chief of Staff of the Army, was sworn in as President on March 29th), who would appoint the government and the provincial administrations. The formation of a new cabinet was announced on March 28th, in which all the portfolios but two (finance and education) were held by officers. Another announcement appointed a Legislative Advisory Commission, composed of three officers from each of the three services, to advise the *junta* on its legislative programme, and at the same time military representatives were placed in control of the General Confederation of Labour and the General Economic (employers') Confederation. On March 31st, 13 trade unions were put under military suspension and five extreme left-wing parties outlawed. On June 2nd, a law was passed establishing penalties for engaging in political or trade union activities, and abolishing in all 48 political parties and youth movements. In September, 1976 trade union legislation was introduced which imposed penalties for incitement to strike and for the imposition of lock-outs by employers, while in May the *junta* had outlined economic plans which were designed to produce a clean break with Peronist policies. Restrictions were to be lifted on the investment of foreign capital, some State-owned enterprises to be denationalised, some State monopolies to be broken, and the bureaucracy to be reduced sharply in size.

The *junta* has thus taken steps to impose its authority not only over the political but also the economic and social life of the country. Speaking in April, 1976 President Videla outlined its plan for the nation's future. It was to follow three stages: first, the assumption of power 'to avoid national disintegration'; second, the economic and political reorganisation of the country; and third, the strengthening of institutions with the object of achieving 'a democratic representative and federative government'. In December he explained that this meant avoiding 'a return to the pendulum movement according to which strong military governments give way to weak civilian governments'. On April 1st, 1977 he announced that the military government would continue for the foreseeable future, and that only when a fundamental reconstruction of the social and political system had been achieved could the *junta* 'install a democratic regime which expresses the joint aspirations of the armed forces and the civilian section'.

The Argentinian army has, therefore, like the Peruvian army, and perhaps in imitation of it, boldly embarked on an autonomous, long-term reform of its country's institutions — with the difference that it sees its task as requiring the dismantling of several State enterprises, rather than their creation, and the encouragement rather than restriction of investment from overseas. While one appears 'right-wing' in its ideology and the other 'left-wing', this is perhaps a reflection of the different economic and social conditions prevailing in each country. The end result desired in both by their armies would appear to be a healthy mixed economy guided by a healthy democratic regime.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

Apart from Brazil, Argentina is the only country in Latin America whose army regards itself as a credible defender of the national territory against external attack. The source of such attack is undefined. Though there are frontier disputes with Chile in the Andes and southern Patagonia, neither country could deploy a significant offensive from across the mountain chain. Towards Paraguay, Argentina has a protective rather than defensive attitude. Bolivia is a threat to none of her neighbours, and Uruguay, though feared in the 1960s as a source of ideological infection, is a military midget compared to Argentina. Brazil remains Argentina's only political enemy in the sub-continent. But though they are certainly rivals for its leadership, Argentina never more explicitly so than under Perón, war between the two would be geographically difficult and politically almost unthinkable. The only external use of Argentinian armed forces of any likelihood would therefore be in an amphibious operation against the Falkland Islands (Islas Malvinas), British possession of which is disputed. The dispute has never yet been carried to the level of military threats.

The army's main operational role is therefore internal and it has indeed been called upon to perform that role frequently and at times intensively since 1972 (see Recent Operations). Since 1900 the army has also attempted, as has no other in Latin America, to act as a 'school of the nation', through the conscription of a large proportion of the annual contingent. In recent years the army has also undertaken development engineering work in the Andes, the south and Patagonia. For the army's major and at times decisive political role, see Command and Constitutional Status.

Commitment

Argentina is a signatory of the two major Latin American defence pacts: the Act of Chapultepec (March/April, 1945) and the Rio Defence Treaty (September, 1947). By the first, Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, the Dominican Republic, Ecuador, Guatemala, Haiti, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, Uruguay, Venezuela and the United States (its moving spirit) declared that any attack upon a member party would be construed as an attack upon all, and provided for the collective use of armed force to prevent or repel such aggression. By the second, the same parties (less Ecuador and Nicaragua) agreed to settle disputes between themselves by peaceful means and made further provisions for collective self-defence against external attack in any situation (Cuba withdrew from the Rio Defence

World Armies

Treaty in March, 1960). The Charter of the Organisation of American States (to which the signatories of the Rio Treaty belong, with Barbados, El Salvador, Jamaica and Trinidad and Tobago) embodied the provisions of the Rio Treaty. Argentina, like most other Latin American countries has a bilateral military agreement with the United States which provides her with access to advice, training and equipment from the United States.

Argentina is a member of the United Nations and the army has contributed observers to its Truce Supervisory Mission on the Israeli borders. It has committed no major contingent to international peace-keeping forces.

Deployment

Argentina is divided into two army areas: First Army, headquarters Rosario, Sante Fé province, and responsible for the coastal regions; and Second Army, Mendoza, responsible for the mountains and north. The country is further subdivided into six military regions: First (HQ Palermo, Federal Capital), Second (La Plata, Buenos Aires province), Third (Paraná, Entre Rios province), Fourth (Córdoba), Fifth (Tucumán) and Sixth (Bahía Blanca, Buenos Aires province, but covering Patagonia). It is ultimately subdivided into 68 military districts, chiefly for recruiting purposes.

The six former 'divisiones de Ejército' were each stationed in one of the regions. The brigades which have replaced them are stationed as follows:

1st Armoured Brigade: Federal Capital

2nd Motorised Brigade: La Plata

3rd Mechanised Brigade: Paraná

4th Infantry Brigade: Córdoba

5th Infantry Brigade: Tucumán

6th Motorised Brigade: Bahía Blanca

The two mountain brigades are located at Mendoza and Neuquén, in the foothills of the Andes. The air-portable brigade is based at Campo de Mayo, the major military base outside Buenos Aires, but its units are dispersed. In 1975 the 17th Airborne Infantry Regiment was at Catamarca in the Andes.

The five air-defence battalions are committed to airfield defence at the air force's bases (Urquiza, Pringles, Morón, Córdoba, Campo de Mayo). The army aviation battalion is based at Campo de Mayo.

Recent Operations

Argentina has not been at war since 1870, the end of the war with Paraguay (1865–70); its declaration of hostilities against the Axis in March, 1945 being a diplomatic move. In the 1970s the army has however been frequently engaged in internal security duties and in anti-guerrilla operations, chiefly against ideological opponents of the government.

The most important groups, which came into being during the period of military government (1966–72) which preceded the return of the Peronista party, and then Perón, to power, are: the *Ejército Revolucionario del Pueblo* (ERP — People's Revolutionary Army), a Trotskyite guerrilla movement formed in July, 1970 as the armed wing of the *Partido Revolucionario de los Trabajadores* (Workers' Revolutionary Party) and hostile both to the Argentinian Communist Party and the Peronistas, as well as to all parties to their right (it split it into three groups in 1973 and having formerly acted as an urban guerrilla organisation, announced the formation of rural units); the *Montoneros*, a Peronista guerrilla group which joined in October, 1973 with another, the *Fuerzas Armadas Revolucionarias* (FAR — Revolutionary Armed Forces) and became a challenge to orthodox Peronism (a political front, the Authentic Peronist Party, was set up in March, 1975); the *Alianza Anticomunista Argentina* (AAA) which emerged after Perón's death in July, 1974 to take revenge on the left-wing groups by reciprocal murder; and the *Fuerzas Armadas de Liberación* (FAL — Armed Forces of Liberation), a Maoist group of which little has been recently heard.

The left-wing groups have favoured urban terrorism, and their chosen methods of attack on organised society have been the selective murder of army officers, policemen and government officials and the kidnapping of the owners or representatives of large businesses. Very large sums of money (at least \$14,000,000 in the case of an Esso executive kidnapped in March, 1974) have been extorted by the left-wing guerrilla groups in exchange for the release of their victims, who have been murdered if not ransomed. In 1974 the ERP embarked on a more military phase. In January 70 guerrillas attacked the barracks of the Azul garrison, killed the commanding officer and his wife and kidnapped a colonel. In August 90 guerrillas attacked barracks at Catamarca but were repulsed; 19 were killed and 15 captured. In January, 1975 the ERP succeeded in shooting down a plane carrying many members of the Army General Staff, and in October, after two smaller but similar incidents, guerrillas hijacked a plane from Buenos Aires to Formosa, attacked the barracks and seized the airport. In August a frigate under construction had been dynamited and sunk in the Río Santiago naval shipyard. In 1975 the ERP set up a rural front in Tucumán province and the army deployed its 5th Brigade on large-scale operations. In February, 1976 it announced that it had discovered 30 ERP camps, ambushed a convoy of 32 ERP vehicles, and killed 174 terrorists for the loss of 20 soldiers.

There is no doubt that the ERP/Montoneros's open offensive against individual army officers and military installations was an important factor in predisposing the generals to intervene against President Isabel Perón's government in 1976. Since its coming to power, the level of terrorism in the countryside has somewhat diminished. The level of political violence in the towns, however, remains high. The Montoneros, who now seem more active than the ERP, began to concentrate on attacks on police stations in 1976. In June they killed the general commanding the police with a bomb planted at his house (two senior police chiefs have also been assassinated, in 1974 and 1975). In July the Montoneros blew up

Police Headquarters in Buenos Aires, killing 18 people; in September a police bus in Rosario, killing ten; and in November the La Plata police headquarters, besides attacking a Buenos Aires police station in the same month. But the Montoneros also continued attacks on army leaders and installations: in October they exploded a bomb at a Buenos Aires officers' club, injuring fifty, and in February, 1977 another alongside a plane in which President Videla was taking off from a Buenos Aires airport. They had made two earlier bomb attempts on his life, in March and October, 1976.

The army killed, wounded and captured numerous ERP and Montonero terrorists during the same period. In December, 1975 during another ambitious attack on the Monte Chingolo arsenal outside Buenos Aires, 160 ERP members were killed (out of an estimated 500 taking part). In counter-operations of its own, five Montonero leaders were killed by the army in September, 1976 while it consistently claimed unspecified success against both ERP and Montoneros. Some of the casualties suffered by the terrorist organisations were the work of counter-terrorists, particularly the AAA, which in 1976 perpetrated murders of priests suspected of left-wing sympathies. In March, 1977 Amnesty International accused the military regime of condoning such counter-terrorism and of cruel and unlawful suppression of terrorism by its own security forces, accusations which the military government strenuously denied.

The army appears to have brought an end to rural guerrilla activity, but urban terrorism is likely to continue, though at a reduced level, for the foreseeable future.

ORGANISATION

Arms of Service

These consist of reconnaissance troops (*Esquadrones de Exploración*), armour-cavalry, aviation troops, infantry, mountain troops, airborne troops (*Tropas Aerotransportadas*), artillery, air-defence artillery, engineers (combat and construction), communications troops and services. The 31 regiments of infantry and 15 of cavalry are numbered, but some also bear names. The 1st Infantry is called the *Patricios*, and wears traditional uniforms to commemorate the victory of the Buenos Aires militia over the British; the 10th Cavalry is called the Horse Grenadiers, provides the presidential escort and wears nineteenth-century Prussian-style uniforms. Not all these regiments are operational: some exist only as training or garrison units.

Operational

Four army corps exist in name, but the operational formation is the brigade which replaced the division after World War II. There are now nine: one armoured, one mechanised, two motorised infantry, two infantry, one air-portable and two mountain. Each consists of three battalions, a reconnaissance unit (in the infantry brigades), an artillery regiment and an engineer battalion. Argentinian brigades operate as such, however, only on manoeuvres. In anti-guerrilla operations the major unit is the battalion. In addition, the army has five air-defence battalions and an aviation battalion.

The navy's marines (*Fusileros de Marina*), 7000 strong, are organised into five battalions of infantry, an artillery battalion and an air-defence battalion.

Paramilitary

There is a federal armed police, the *Gendarmería Nacional*, 11,000 strong, commanded by an army general. Organised chiefly for border duty, it can deploy formed units for anti-guerrilla operations. The Coastguard (National Maritime Prefecture) is 9000 strong. The police are organised on a provincial and municipal basis.

RECRUITMENT, TRAINING AND RESERVES

Recruitment and Training

Although six out of the fourteen major Latin American countries have passed universal conscription laws, in practice only Cuba, Argentina and perhaps Brazil insist on their application; elsewhere service tends, in fact if not in law, to be selective. Argentina's law, the Ricchieri law as it is called after the Minister of War who sponsored it, was passed in 1901. As amended in 1905, it provided for 1 year of service in the army (or two in the navy, the choice to be decided by lottery). Naval service was subsequently reduced to 14 months, but the army and air force term is still 1 year. During the 1920s the law furnished an annual contingent of 20,000–25,000. The present size of the army contingent is about 63,000, with 15,000 regular NCOs and 5000 regular officers. Recruits are trained in their units. Regular NCOs are trained at the *Escuela de Suboficiales 'Sargento Cabral'* at Campo de Mayo, outside Buenos Aires (established 1908). Specialists are trained at the arms schools (artillery, cavalry, infantry, communications, engineers), also located at the Campo de Mayo.

Regular officers are recruited from high-school graduates by competitive examination in academic subjects. The cadet training centre is the *Colegio Militar*, located at El Palomar, between Campo de Mayo and Buenos Aires (founded 1870).

World Armies

Since 1946 education there has been free. The number of cadets is about 750 and the course lasts 4 years. Staff College training is provided at the *Escuela Superior de Guerra*, Buenos Aires, founded in 1900 by a German military mission. German influence on the Argentine officer corps has been very strong. A German military mission remained in Argentina until 1940, and hundreds of Argentinian officers went to Germany for training during those 40 years. There is a higher war college at Buenos Aires, the *Centro de Altos Estudios*, which opened in 1943.

Since World War II, German influence on the Argentinian army has naturally waned, to be replaced by American. Many Argentinian officers now attend the American staff and war colleges, as well as the School of the Americas in the Canal Zone, where anti-guerrilla warfare techniques are taught.

Reserves

The military obligation lasts from the conscript's twentieth to forty-fifth year. The first ten are spent in the active army, one on duty, nine in the reserve; the next ten are spent in the National Guard, the last five in the Territorial Guard. The two Guards are paper forces, however, and the reserve is rarely, if ever, called out. In theory the reserve holds 600,000 men, the National Guard 200,000 and the Territorial Guard 50,000.

EQUIPMENT AND ARMS INDUSTRY

Argentina was the first Latin American country to embark on the manufacture of its own weapons for its army, the first to aim at self-sufficiency and, is today, the first to be within sight of achieving that aim (though still some way off).

San Martín organised the local manufacture of small arms for his army before he set off to liberate Chile and Peru in 1817. His factories remained in existence during the nineteenth century and are said to have turned out copies of light Krupp field-guns in the 1880s. Certainly German engineers helped in 1911 to set up a factory producing Mauser rifles, and other foreign experts later established plants to manufacture Browning pistols, Madsen and Colt light machine-guns, Stokes Brandt mortars and Bofors light field guns. Plans were formulated by the army as early as 1923 to systematise this manufacture, but it was not until October, 1941 that the appropriate State supervisory authority was set up. It was called the *Dirección General de Fabricaciones Militares* (DGFM) and took charge of the *Fábrica Militar de Aviones* at Córdoba and naval shipyard at Río Santiago. It later founded or took over the small-arms ammunition factory at Puerto Borghi, Santa Fé province, the Domingo Matheu small-arms factory at Rosario, Santa Fé province, the artillery ammunition plant at Río Tercero, Córdoba province and the powder and explosives works at Villa María, Córdoba province. A military research establishment (CITEFA — *Instituto de Investigaciones Científicas y Técnicas de las Fuerzas Armadas*) was subsequently set up to assist the work of the DGFM, which since 1952 also put out work to private industry. As a result, military transport and armoured vehicles have been produced, wholly or in part, in Argentina. An early production of a tank, the 35 ton Nahuel DL-43 of 1943, was unsuccessful but the French AMX-13 has apparently been built (probably from imported parts) by Argentinian subsidiaries of Fiat and Kaiser. A new tank (*Tanque Argentino Mediano — TAM*) and APC (*Vehículo Combate Infantería — VCI*), both designed by Thyssen-Henschel and based on the Marder combat vehicle, are now to be constructed in Argentina. The gun (an Argentinian development of the French 105 mm) and the turret (which will be imported from Germany) are to be assembled at Río Tercero, and the whole vehicle completed at Buenos Aires. About 200 TAMs and 300 VCIs are to be built altogether; the proportion of Argentinian-made parts to each has not been revealed. It is claimed, however, that the 30 ton, 4-man tank is superior to the Leopard I and that Thyssen hope to export a development to other countries.

Pistol: Browning 9 mm (Fábrica Militar de Armas Portátiles, Domingo Matheu, Rosario)

Sub-machine-gun: PA-3-DM 9 mm (Fábrica Militar)

Rifle: FAL 7.62 mm (Belgium; Fábrica Militar)

Machine-gun: FN 7.62 mm (Belgium; Fábrica Militar)

Mortar: Hotchkiss-Brandt 81 mm (France; Fábrica Militar)

Anti-armour weapons: 75 mm recoilless rifle (USA; Fábrica Militar) and 90 mm recoilless rifle (USA; Fábrica Militar); 105 mm Canon sin Retroceso (Argentina; Fábrica Militar); Cobra 2000 missile (W. Germany) and SS-11 missile (France)

Air-defence weapons: Hispano-Suiza 30 mm Cannon (Switzerland) and Bofors L60/70 40 mm Cannon (Sweden; Fábrica Militar); Tigercat missile (Britain)

Artillery: 105 mm pack howitzer (Italy; Fábrica Militar), 105 mm M-2 howitzer (USA) and 155 mm M-2 howitzer (USA); 155 mm F3 SPG (France)

Armour: M-113 APC (USA; 250 in service) and Mowag Roland APC (Switzerland; 150 in service); AMX-13 light tank (France; 120 in service); M-4 Sherman tank (USA; 120 in service)

Aircraft: 15 light transports, 15+ helicopters. The air force has about 75 transports, including seven Hercules, and at least 20 helicopters

The naval infantry has 35 American amphibious tracked carriers and Bantam anti-tank missiles, besides weapons common to the army.

RANK, DRESS AND DISTINCTIONS

Ranks follow the American system, with the additional rank of *Subteniente* (probationary second-lieutenant). The army wears a grey service dress and American-style combat uniform. The *Patricios* regiment wears on ceremonial occasions the dress of the War of Independence period.

CURRENT DEVELOPMENTS

The armed forces *junta* which took power in March, 1976 instituted severely authoritarian reforms. It announced that its aims were 'to enforce Christian moral values, eradicate subversion, extremism and corruption, revitalise the country's constitutional bodies and create a fair social and legal order'. This appeared to require, at the outset, the dissolution of congress, the provincial legislatures and city councils, trades unions, employers' associations, professional associations and political parties, and the dismissal of provincial governors and federal 'interventors' (the emissaries of the central government to whom in Argentinian law it may entrust delegated powers in the provinces, universities and trade unions). It further announced that it would remain in power for 3 years. Its economic policy, hastily designed to deal with a situation of collapsing exports and inflation of 600% per annum, included measures to encourage foreign investment, reduce the size of the bureaucracy by one-sixth immediately, lower the artificially high exchange rate and put some State-owned enterprises onto the market. The other pressing requirement was to reduce the level of public violence, which had caused the deaths of 300 people in the first quarter of 1977. Many of these deaths were the work of the right-wing *Alianza Argentina Anticomunista* (AAA), which it was believed employed the services of off-duty policemen, but others were the responsibility of the left-wing groups, particularly the Montoneros and ERP. During 1975 they had directed their attacks mainly at army personnel and installations, but in the year after the military coup they turned their attention to the police. They were nevertheless also able to make three separate attempts on the life of the president, in March and October, 1976 and in February, 1977 when they exploded a bomb beside his aircraft as it was taking off.

During 1977 the level of violence was much reduced, as leaders and personnel of both groups were killed or arrested. Speaking to the nation in March, 1977 however, General Videla set no date for the elections he had promised on taking power. Legislative as well as executive functions remain with the *junta*, which has also taken effective control of organised labour. There are no signs, therefore, of any immediate return to civilian rule in Argentina, nor of dissension in the military government sufficient to hasten such a return.

JOHN KEEGAN

AUSTRALIA

HISTORY AND INTRODUCTION

The Australian army is widely regarded as one of the most efficient, for its size, in the world today. It is a major strategic factor in the politics of south-east Asia and the Pacific, and the repository of a respectable, even awesome, military tradition. Yet it has a history, as an effective force, of less than 70 years, and has achieved its reputation largely in the face of strong domestic anti-militarist feeling.

Until 1870 Australia, then consisting of seven unfederated States, was defended by a garrison of British troops, the forbears of whom had been raised as early as 1789, sailing to New South Wales with the first convict ships in the same year. In 1870, however, following a British government decision to make the white colonies provide for their own defence, the garrison was withdrawn. The only military forces left to the States by this move were the locally-raised volunteers of New South Wales, Victoria and South Australia, brought into being after an earlier, partial withdrawal at the time of the Crimean War. Taking these units as a basis, the State governments went on, between 1871 and 1900, to form a three-tiered military system which was distinctly Australian. It consisted, in each State, of (a) a Permanent Force, mainly of administrative troops, but with some batteries of garrison artillery; (b) a Militia, a part-time, but paid, body of engineers, field artillery, cavalry and infantry; and (c) a Volunteer Force of part-time, unpaid infantry. It was from the Militia and Volunteers that New South Wales sent a contingent to the British army fighting in the Sudan in 1885, and all States contributed to the sizeable Australian contingents for the South African War of 1899–1902. It was in this latter conflict that the Australians first demonstrated their formidable military talents, particularly as mounted infantry against the Boer Commandos.

In 1901, when the Australian States were federated into a single Dominion, the various Permanent Forces were amalgamated, although the Militia and Volunteers remained under local control. However, the low military value of the part-timers, even for home defence, was undisguisable, and in 1911, after a visit by Lord Kitchener, they were finally brought under Federal control and reorganised. Officers and NCOs were transferred from the Militia to a new Citizen Force, the two part-time forces were disbanded and all medically fit male Australians in the age-range 12–25 years were made liable for army training. Junior cadets (aged 12–14 years) and senior cadets (14–18 years) were required to perform 90–96 hours' drill each year, while the older men (18–25 years) had to do 16 days' training, eight continuously, in units of the new Citizen Force, which, although controlled centrally, was recruited and organised by the individual States. The universality and home-defence orientation of these arrangements suggests, in retrospect, that Australian military institutions were set to develop basically along Swiss lines, but this was not to be. In 1914 Australia, in common with other colonies, responded eagerly to Britain's call to arms and, in the ensuing upheaval, the Citizen Force structure was overthrown. Its members, although making up a nominal 92 battalions, were young (average age 19–21 years) and too little trained to be instantly embodied as an expeditionary force, while their terms of service did not include active duties overseas. Volunteers for an Australian Imperial Force (AIF) were therefore requested as individuals, and out of the rush, swollen by many Citizen Force and old Militia men, the 1st Australian Infantry Division and 1st Australian Light Horse Brigade were formed in 4 weeks. These formations, merely a vanguard to many more, were sent to Egypt, from where the 1st Australian Division, joined by the later-raised 2nd and the New Zealand Division to form ANZAC (Australian and New Zealand Army Corps), was to make a heroic but militarily fruitless journey to Gallipoli in 1915.

The Citizen Force remained in existence throughout the war, with many of its members transferring from it to the Imperial Force as partially trained recruits. Australia's great military reputation was won, however, by the AIF which, although basically an *ad hoc* organisation, had put into the field by the end of the war in 1918 no less than five full infantry divisions and two divisions of light horse. The light horse remained in Egypt and Palestine during the Gallipoli campaign, and operated with spectacular success against the Turks throughout the conflict. The infantry, on the other hand, was transferred to France after 1915, and by the last year of the war the Australian Corps had come to form, with the Canadians, the spearhead of the British Expeditionary Force and its counterpart to the shock divisions with which Ludendorff opened his final, almost successful 1918 offensives. The Corps Commander, Monash, a mining engineer in civilian life, had revealed himself to be perhaps the most talented general on the British side, and the Australian soldier, although thought undisciplined and casual by his British allies, had acquired something of a reputation as a military superman.

The AIF disappeared at the end of the war, but its organisation and divisional titles, which now meant so much, were preserved in the Home Defence Force, which was itself reformed. Conscription remained, but the junior cadets were disbanded and compulsory training in the Citizen Force (confusingly re-named the Militia) was limited to periods in two successive years. In 1929, due to the economic depression, conscription was abandoned and numbers in the Militia dropped to 30,000. The result was that, when war broke out in 1939 — a war to which Australia was to respond as eagerly as in 1914 — the divisions of the Militia were at 40% strength only. Conscription was accordingly reintroduced, but the Militia's

liability for service was still restricted to mainland Australia. To provide a force for intervention further afield, the government had once more to call for volunteers, this time to form the 2nd Australian Imperial Force.

World War II, unlike World War I, was, however, to bring an enemy — the Japanese — into Australian-controlled territory (in Papua–New Guinea) and to threaten the Dominion itself with invasion. These factors were to have two effects: they required the Australian government, firstly, to extend the Militia's liability for service to include the Australian-controlled territories beyond the mainland, and, secondly, to exercise a far stricter control over the employment of the 2nd AIF than it had done over the 1st. The 1st AIF had acted, in effect, as a powerful reinforcement to the *British* army; the 2nd AIF, although it served Britain magnificently in the Western Desert before, and even for some time after Japanese intervention — notably in the first defence of Tobruk and at Alamein — had to be employed from 1943 onwards in the Pacific as an *Australian* defence force. Popular demand for Australian control of its own armed forces could not, in addition, be ignored after heavy losses in the division isolated on Crete in May, 1941, and particularly after the pointless disembarkation, under British orders, of the 8th Division at Singapore 9 months later, straight into Japanese hands.

At the end of the war Australia did not, as in 1918, move at once to disband the AIF. A brigade group had to be found to represent Australia among the Allied forces of occupation in Japan, and from this brigade grew the sizeable regular army which exists today. The process of growth was by no means straightforward, however, incorporating a series of changes to the Australian military structure which began as early as 1947. In that year it was decided to revert to a voluntary system of enlistment for the Militia, hoping thereby to create another Citizen Force (now renamed the Citizen Military Forces, or CMF) of some 50,000 men who could act as a back-up and home-defence alternative to a Regular Army of 20,000. Unfortunately the Australian temperament is perhaps unsuited to peacetime volunteering, and after the beginning of the Korean War in 1950 has shown how small the CMF had become and how little an alternative it was to the Regular Army committed elsewhere, a National Service Training Scheme had to be introduced. Between 1951 and the scheme's suspension in 1959 approximately 30,000 trainees were enlisted each year for 98 days' full-time service followed by 2 years' part-time duty in the CMF; an arrangement which rapidly increased the size of the home-defence forces to some 85,000 men. While this was taking place, of course, the Regular Army was actively involved in the defence of Australian interests on the mainland of Asia, chiefly in Korea (1950–53) and Malaya (1948–60).

The next major change occurred in 1959–60, when the army as a whole, both Regular and CMF, was reorganised into what was called the 'pentropic' system, the basic unit of which was a 'battle group' of an enlarged infantry battalion with supporting arms. A pentropic division — two of which were formed, the 1st consisting of Regular and CMF units together, the 3rd solely of CMF volunteers — consisted of five such battle groups and a 'combat support group'. This organisation remained in effect until 1964, when a new form of selective conscription necessitated further change. Every male Australian, upon reaching the age of 18, took part in a ballot and, if chosen, was called up for 2 years in the Regular Army. Those who escaped continued to do military training, however, it being their task to man the CMF, now expanded into two separate divisions, the 2nd and 3rd, leaving the 1st as before, a combination of Regular and CMF units.

This reorganisation of 1964 constituted the beginning of a 'one-army' concept in Australia, a trend considerably reinforced when at the same time the charter of the CMF was amended to give them a follow-up role to regular troops in time of war, dispensing with their previous home-defence-only commitment. Although the CMF was not involved in the Vietnam conflict — Australian efforts in that theatre being left to the regular forces with their experience of counter-insurgency gained in Malaya and Borneo (1963–6) — and despite the end of National Service in December, 1972 which rapidly reduced overall military strength, this basic balance between full- and part-time soldiers still remains. In many ways it is perhaps the ideal so far as the Australian people are concerned, for with their anti-militarist tradition on the one hand and their history of eager response in emergencies on the other, a dependence upon one or the other of the two systems alone would involve many disadvantages. As it is, with a small but highly professional regular force gaining valuable experience and a fully trained CMF ready to act as reinforcements, the army as a whole seems well prepared to perform its task of defending Australian interests, wherever they may be deemed to lie.

STRENGTH AND BUDGET

Population: 13,770,000
 Military service: voluntary
 Army: 31,600 regulars; 20,110 reservists (CMF)
 Navy: 16,200; 16 major vessels, 22 smaller
 Air force: 21,650; 120 combat aircraft
 Estimated GNP (1976): \$U.S. 100,700,000,000
 Defence expenditure (1976–7): \$U.S. 2,800,000,000

COMMAND AND CONSTITUTIONAL STATUS

Command

Following closely upon the British pattern of army administration and command structures, in 1964 a Ministry of Defence,

World Armies

co-ordinating army, navy and air force policy, was established, nominally under the control of the Governor-General of Australia as representative of H.M. Queen Elizabeth II, but actually the responsibility of a Minister of Defence, a civilian politician appointed by the political party in power. Under him, as the chief decision-making body, there is a Defence Council, the membership of which is:

The Minister of Defence	}	(Chairman)
The Chief of Defence Staff		(Deputy Chairman)
The Secretary of Defence		
The Chief of Naval Staff		
The Chief of General Staff		
The Chief of Air Staff		

The Secretaries of Foreign Affairs and of the Treasury, as interested parties in military decisions, are also vote members, and the Council may appoint other members at its discretion. The Council as a whole is responsible for all command and administration functions, while assisting the Minister in the formulation of defence policy.

Constitutional Status

Following the British pattern again, the Australian Commander-in-Chief, to whom all service personnel owe direct allegiance, is H.M. Queen Elizabeth II, although for purposes of convenience the Governor-General, as the monarch's representative in Australia, is invested with the power to raise and maintain the armed forces. In practice this has little effect, for unless government decisions are directly alien to Commonwealth interests, the Governor-General's military powers are purely nominal. One advantage of the system, however, is that the armed forces owe their allegiance not to the government in power but to a higher authority, so cutting down the possibility of military forces being used for purely political ends.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role and Commitment

The basic role of the Australian army, in common with its counterparts in other countries, is the protection of the homeland itself from external and internal aggression. The latter threat has never appeared to be very great, and, with an adequate civilian police force, the army is unlikely to be called upon in this role. The threat of external aggression, however, is felt strongly, particularly after the experiences of 1941–5 with Japan and the growth of communist influence in Asia since the end of World War II. As a result, Australia now has a tradition of defence co-ordination with like-minded countries in her area and since 1945 has become a member of several multilateral defence arrangements. These range from the ANZUS Pact of 1951, whereby Australia, New Zealand and the United States agreed to support each other in the Pacific, through the SEATO Treaty of 1954 which covered collective defence in Asia, to the Five Power Defence Arrangements of 1971 for the protection of Malaysia against communist aggression. This latter agreement led to the formation of a combined ANZUK force of Australian, New Zealand and British troops, and although this has now lapsed, it does not seem incorrect to suppose that, in the event of trouble in Malaysia, Australian commitment will be renewed. At the moment, however, the idea of defending Australia by having regular forces constantly in Asia has become less attractive, and the majority of the armed services remain in the home territories.

Deployment

With the exception of two Mirage squadrons of the Royal Australian Air Force, which remain in Malaysia/Singapore as part of the air-defence system laid down by the Five Power Defence Arrangements of 1971, all Australian forces are now concentrated in Australia itself. Representative forces of both the Regular Army and CMF are stationed in each of the seven States, with some units in Papua–New Guinea.

Recent Operations

Since 1945 Australian forces have been involved solely in the Asian theatre, beginning with the Korean conflict of 1950–3. The bulk of their experience, however, has been in counter-insurgency and, with the British, New Zealand and Rhodesian armies, they may be regarded as amongst the most successful in this field. Starting with the Malayan emergency of the 1950s and including the Borneo confrontation of 1963–6, this experience perhaps culminated in Vietnam in the late 1960s, where the techniques employed by the Australian units (particularly the Special Air Service Regiment) surprised the Americans with their subtlety and success. In common with many other Western-style armies, the Australians have no recent experience of large-scale or armoured warfare.

ORGANISATION

Between 1960 and 1973/4 the pentropic division system remained as the basis of Australian military organisation, with its three divisions (numbered 1st, 2nd and 3rd) each consisting of five 'battle groups' and a combat support group, each battle group in turn being made up of an enlarged infantry battalion with supporting arms. Such an organisation depended, however, upon the large number of soldiers gained through the National Service scheme, and when conscription was abolished in late 1972, changes had to be made. Known as the 'functional command' system, these imposed the structure which operates today. In the Regular Army, the front-line units constitute an infantry division, to be reinforced in time of war with one field force group from the CMF. Three task force headquarters also exist on a permanent basis, apparently to command and control the remaining six CMF field force groups. Supporting arms and services exist at all levels.

Composition of the Regular Army

This is as follows:

- | | | |
|---|---|---------------------------------|
| 1 infantry division HQ and 3 task force HQs | } | Royal Australian Armoured Corps |
| 1 tank regiment | | |
| 2 cavalry/APC regiments | | |
| 6 infantry battalions (1st–6th Battalions, Royal Australian Regiment) | | |
| 1 Special Air Service Regiment | | |
| 4 artillery regiments (1 medium, 2 field and 1 light anti-aircraft) | | |
| 1 aviation regiment | | |
| 3 field engineer regiments | | |
| 1 army survey regiment | | |
| 2 signals regiments | | |
| 1 logistic support force | | |
| Women's Royal Australian Army Corps | | |

RECRUITMENT, TRAINING AND RESERVES

Recruitment

Regular Army

Since December, 1972 all military service in Australia is voluntary, and for those who choose to enter the Regular Army, the initial engagement is for 6 years, with re-engagement at the end of that period for either a further 6 or 3 years, up to the age of 55 years, when retirement is compulsory. Both men and women may enlist at any age between 17 and 43 years, although restrictions apply at both ends of the range: those under 18 years have to produce their parents' written consent; those over 35 may be expected to bring into the army some specialist skill. Australian subjects with 'a satisfactory civil record' and a good general education are obviously given preference, but both British and 'alien' subjects with resident status may enlist. Terms of service specify that soldiers may be sent 'anywhere within or beyond the limits of the Commonwealth of Australia', although it is laid down that no-one under the age of 18 years will leave the mainland, nor anyone under 19 years be sent on active service. Officer volunteers, on the other hand, must be between the ages of 19 and 25 years unless recruited from the ranks, and are expected to remain on permanent service up to the age of 55 years, although commissions may be resigned anytime after 3 years' service.

The CMF

For those volunteering for part-time service in the CMF the terms are very similar to those of the Regular Army. Both men and women have to be 17 years' old, although the rules governing older people do vary. Men up to 35 years of age may volunteer for Field Force duty (as the direct back-up to the Regular Army) and up to 45 years if 'other than Field Force'; women may join so long as they are under 30 years with no previous military experience, but if they are ex-regulars this may rise to 38 years. In all cases the initial engagement may be for 2, 3 or 6 years, with re-engagements for 2 year periods thereafter, up to the age of 48 years for men, 50 years for women. CMF officers tend to rise through the ranks, although ex-regular officers may have their commissions transferred.

Training

Regular Army

Officers chosen for the Regular Army are trained initially at one of two establishments. The older — the Royal Military College, Duntroon, founded in 1911 — involves a course lasting 4 years, during which the officer cadet is expected to

World Armies

follow both military and academic courses; indeed, the college is directly affiliated to the University of New South Wales, and all successful cadets receive a degree in arts, applied science or engineering when they are commissioned. At the Officer Cadet School, Portsea (Victoria), set up in 1951, however, the course is far shorter (11 months only), and does not include a great amount of academic work. Regardless of which establishment he attends, each newly commissioned officer is then sent to the specialist school of the arm-of-service he chooses. These schools, ranging from the Armoured Centre at Puckapunyal (Victoria) to the School of Army Aviation at Oakey (Queensland), also cater for the training of NCOs and private soldiers who attend arm-of-service courses after promotion or basic military training in their particular units.

The CMF

All the CMF volunteers receive their basic training within the units they join, attending specialist courses at the appropriate schools on the same basis as the regulars.

EQUIPMENT AND ARMS INDUSTRY

Except in the field of small arms (particularly sub-machine-guns) Australia does not have an arms-manufacturing industry capable of meeting its military needs, and has to depend upon other countries for the supply of equipment. In August, 1975, for example, Australia ordered 20 Rapier surface-to-air missile systems from Britain, at a cost of \$U.S. 37,000,000, and is currently awaiting delivery of 87 Leopard medium tanks from West Germany and an unspecified number of Harpoon surface-to-surface missiles from the United States. Delivery dates vary between 1976 and 1981, however, so it is perhaps best to ignore these items when listing the equipment currently in use.

Arms and Equipment

Pistol: 9mm Browning L9A1 (Canada and Belgium)

Rifle: 7.62mm L1A1 (Australia); 5.56mm M16 (USA) and 7.62mm Omark M44 sniper (Australia)

Sub-machine-gun: 9mm SMG F1 (Australia) and 0.5in Browning heavy barrel M2 (heavy; USA)

Machine-gun: 7.62mm M60 (sustained fire; USA) and 7.62mm L4A4 (light; Britain)

Mortars: 81mm mortar F1 (USA and Britain)

Anti-tank weapons: L-6 Wombat 120mm RCL (Australia) and Entac ATGW

Anti-aircraft weapons: 40mm AA guns and Redeye SAM (USA)

Artillery: 5.5in gun (Britain; 35 in service), 105mm pack howitzer (Britain; 253 in service) and M-40 106mm

Armour: M-113 APC (USA; 753 in service) and Centurion medium tank (Britain; 143 in service)

Aircraft: Bell 47 helicopter (USA; 29 in service) and Bell 206 B-1 helicopter (USA; 44 in service, a further 9 on order);

Pilatus Porter light aircraft (Switzerland; 18 in service) and Nomad light aircraft (11 in service)

Also 65 assorted watercraft in service, chiefly with the engineer and survey regiments.

RANK, DRESS AND DISTINCTIONS

Rank

General	Crossed sword and baton, one crown, one star
Lieutenant-general	Crossed sword and baton, one crown
Major-general	Crossed sword and baton, one star
Brigadier	One crown above three stars
Colonel	One crown above two stars (shoulder)
Lieutenant-colonel	One crown above one star (shoulder)
Major	One crown (shoulder)
Captain	Three stars (shoulder)
Lieutenant	Two stars (shoulder)
Second-lieutenant	One star (shoulder)
Warrant Officer I	Australian arms (sleeve)
Warrant Officer II	Crown (sleeve)
Staff sergeant	Crown above three chevrons (sleeve)
Sergeant	Three chevrons (sleeve)
Corporal	Two chevrons (sleeve)
Lance-corporal	One chevron (sleeve)
Private	—

Dress

In common with the British and other Commonwealth armies, most patterns of dress take khaki as their basic colour. The only distinctive items of dress in the Australian army are the bush hat with the left side bent up, and an American-style steel helmet. Combat dress is uncamouflaged (except for certain styles of jungle warfare) and leggings are worn with most types of working dress. Officers' mess-dress follows the British pattern, and exists in both winter and summer styles.

Distinctions

Each unit or corps within the Australian army wears a distinctive cap badge, with matching collar devices and, in working dress, some form of shoulder title.

CURRENT DEVELOPMENTS

As a home-defence force, capable of operating beyond the mainland in spheres of national interest on the continent of Asia, there can be little doubt that the Australian army is a power to be reckoned with. The portions of it which make up the Regular Army are well trained, widely experienced and highly professional, while the reserve potential of the CMF is sufficient to provide useful and quickly mobilised reinforcements. In an age when the main danger to Australian interests is likely to be communist-inspired insurgency in south-east Asia, this would appear to satisfy the needs of the Australian people.

But the army is small, particularly in its regular elements, and although equipped with armour and artillery for a conventional role, this shortcoming of size must act against its long-term usefulness in a general war. No doubt this was an argument used to support the lengthy retention of conscription, but the government decision in December, 1972 to switch to an all-volunteer force probably reflects more closely the general feeling of the Australian people. Their reaction to large-scale war in both 1914 and 1939 shows how quickly a full-size army could be raised in an emergency, and the government, in this age of economic stringency, probably stands to gain far more through the maintenance of a qualitative rather than a quantitative force. No-one can deny the professionalism of the Australian army, particularly in the role which it is most likely to be called upon to carry out — counter-insurgency. Therein lies its strength.

JOHN PIMLOTT

AUSTRIA

HISTORY AND INTRODUCTION

The army of Austria, like the State which it serves, was within living memory one of the largest and most powerful in Europe. In the seventeenth century it had stood in the forefront of the defence of Europe from Ottoman invasion. In the eighteenth it offered the principal military counterweight to France in the struggle for continental supremacy. In the wars of the French Revolution and Empire it was the most constant element in the coalitions formed to overcome the Republic and to defeat Napoleon, and as late as 1915 it could conduct simultaneous operations against half the Russian and the whole of the Italian armies on two widely separated fronts. Moreover, it had produced during those centuries some of the most illustrious generals of history: Starhemberg, defender of Vienna against the Turks in 1682; Eugene of Savoy; the Archduke Charles; Schwarzenberg, the victor of Leipzig; Radetzky.

Its role within the Habsburg empire had been as important as its victories over the empire's foreign enemies. Grillparzer's poetic salutation to Radetzky, *'In deinem Lager ist Oesterreich'* ('In your camp is Austria') defies easy translation. But its importance is clear enough. In an empire of 10 nationalities and five religions, without common political institutions and lacking even a unified crown — the Archduchy of Austria and the Hungarian monarchy, though vested in the same person, were separate sovereignties — the army served as the only visible bond between the emperor's disparate subjects and the only organ through which they could jointly offer him their loyalty. As a means of attracting their loyalty it was remarkably successful. It is fashionable now to use instances of disaffection in the Slav regiments during World War I as evidence of the empire's impending dissolution. More remarkable is their infrequency. The army may not have fought very well between 1914 and 1918, but it held together almost to the end. It did not, like the Tsar's, 'vote for peace with its feet', nor, like the French or the Italian, suffer a mid-war collapse of morale. This devotion to duty is principally a testimony to its success, alone among the institutions of the empire, in solving the 'nationalities problem'. It did so by frankly recognising it, through the organisation of regiments on a linguistic basis, and at the same time discounting nationality in its promotion policy. The army's 'centre of gravity', like the empire's, was inevitably German; but anyone who took the trouble to make himself normally fluent in the language could rise within it as far as his ability could take him; the Croats in particular were certainly over-represented in the officer class, at the top of which were also found Poles, Italians, Slovenes and Romanians. The army also made liberal provision for the cultural differences and traditions of its constituent contingents, so that at one end of the empire were found Muslim regiments of Bosnians, run in a spirit not dissimilar from those of the British Indian Army, at the other the Tiroler Kaiserjäger, whose independent mountaineer riflemen were allowed to organise themselves along lines more resembling the militia of neighbouring Switzerland than of the army of a bureaucratic monarchy.

Paradoxically, the collapse of the monarchy and the reduction of Austria to its German-speaking heartland did not diminish the political importance of the army. 'Remnant Austria', small as it was in size and population (6,500,000), was racked by internal problems and threatened by the territorial ambitions of the successor States. Its frontiers were eventually guaranteed by the intervention of the great powers, but they could not cure the dislike existing between the right-wing country people of the mountainous western half of the State and the left-wing town dwellers of Vienna and the eastern industrial areas. Both were armed, but so fearful was the new republic's first socialist government of right-wing reaction that it created its own socialist army, the *Volkswehr* (People's Army), to guarantee its hold on power. In the event, civil war was averted, and the *Volkswehr* transformed into an acceptable and reasonably apolitical State army, the *Bundeswehr*. However the population was not disarmed — in the Tirol there was a tradition as old as Switzerland's of the private possession of arms — and during the 1920s the loose associations of home guardsmen, which had briefly had their counterparts throughout central Europe in the immediate aftermath of the political collapse of 1918, coalesced into private armies under party control: the Social Democrats' *Schutzbund* and the Christian Socials' *Heimwehr*. In 1930 the latter entered parliament on its own account and in 1932, Dollfus, the new Christian Social Chancellor (a famous ex-Tiroler Kaiserjäger) was obliged to offer it cabinet seats as a means of maintaining his majority. Its leaders pressed him hard to take action against the *Schutzbund*, as did Mussolini, to whom he had turned for foreign support as an alternative to the all too pressing attentions of Hitler. Arms searches and arrests of Social Democrats provoked disaffection and eventually, in February, 1934, a general strike, and that in turn, civil war. Though the *Schutzbund* remained on the defensive, Dollfus took the decision to commit the army which, reluctantly and illadvisedly, brought in heavy weapons and shelled the working-class districts of Vienna — in particular the great municipal apartment blocks, the Karl-Marx-Hof and the Goethe-Hof, into submission.

Within four years, Austria, with its army, had disappeared inside Greater Germany. But the civil war had left a mark on Austrian politics which persists to this day: it had cast the Social Democrats in the role of heroic defenders of democracy, truly anti-Fascist without being communist; and it had tainted the army with a reputation for partisan politics and

heavy-handed repression, not dissimilar from that which the execrated Haynau had won for it by his pacification of Hungary in 1848.

As a 'victim of Nazi aggression', Austria was permitted to form its own government as soon as the war was over, a government of all the parties, Social Democrat, Communist and People's (the new Christian Socialists), through which each of the two occupying blocs, Soviet and Western, nevertheless hoped to establish an independent Austria favourable to its own cause. The Russians were frustrated in their hopes, as a result of the failure of the Austrian Communist Party to win seats at the polls, to secure key ministries or to gain control of the trade unions, and in 1955 agreed, after prolonged negotiation, to sign a State Treaty which re-established Austrian sovereignty, ended the occupation and transferred full power to the ruling Social Democrat—People's Party coalition, all within the context of Austria's 'perpetual neutrality'.

The intention of all parties to the treaty, domestic and foreign, was to make of Austria another Switzerland, with which it shared a frontier and, in the western *Länder*, a cultural tradition. Militarily, however, the Austrian tradition was different from the Swiss and the years of occupation had left it with an embryo military structure quite unlike its neighbour's citizen militia. In their zones, the British, Americans and French had raised from the existing gendarmerie a mobile regiment of three *Alarm* battalions, as an internal security force, which played an important part in the suppression of the Communist campaign of industrial disorder in 1950. It was already foreseen as the nucleus of a State army and from 1952 its ranks were deliberately swelled to provide future leaders for the conscript force it was planned that Austria should raise on independence. The main function of that force should be the prevention of a communist bid for power in the wake of a Soviet withdrawal of its occupation troops. Evacuation led to no such bid, but the new State persisted nevertheless in the creation of what, for one so small, was quite a sizeable army, initially by the transfer of about half the gendarmerie—the 'B' or *Bereitschaftsgendarmerie* (6500 men)—into the *Bundesheer*, then through the mechanism of the draft.

Evidence accumulated during the first 10 years of independence that the planned military framework was too ambitious for Austria's population and economy: by 1960 it had grown to include 48 battalions, organised into nine brigades, one for each of the Federal *Länder*. But lingering anxieties for the security of the border, raised by the Hungarian uprising of 1956, and a bipartisan defence policy in the coalition government, deferred a serious reconsideration. The victory of the Social Democrats in 1970 brought the debate out into the open, and in particular the party's buried mistrust of a conventional standing army. Like most of the orthodox Socialist parties of Western Europe, it had always held, on ideological grounds, that a militia was preferable to a regular army, and it could find powerful arguments for moving to a militia system in Austria's contemporary situation: there was the convincing Swiss analogy; there was detente; there was the mounting cost of equipment, much of which had to be bought abroad; and there was the growing dislike among the military age-groups of prolonged conscript service.

Its original intention was to introduce a militia system based on 6 months' service. The army leadership was appalled. In part this was no doubt due to a certain rigidity of outlook, which was naturally formed by memories of, and in many cases personal links with, the *Kaiserheer* and its great imperial past (it is not insignificant that the Vienna Museum of Military History is without question the most magnificent in Europe). Armies are slower to change their characters than almost any other sort of institution, and an assumption of international status similar to Switzerland's could not be expected automatically to entail an inhabitation of Swiss military forms and attitudes, which themselves had taken 700 years to develop. In addition, the leadership was also genuinely alarmed by the dangers which adoption of a purely militia system would bring. Austria, unlike Switzerland, had frontiers with Warsaw Pact as well as NATO powers, offered both sides important strategic routes for the movement of their forces and had, as recently as 1968, had to man its own frontiers as a result of the 'Czech spring' and the Soviet measures taken against it.

The *Wehrgesetznovelle* of July, 1971 by which the parliament (*Nationalrat*) eventually instituted reform, represented therefore a compromise. Conscription was reduced from 9 months to 6 months and many of the units were scheduled for transformation from standing to militia (*Landwehr*) status, but provision was made for conscripts to volunteer for an additional two months and so to provide the manpower, with the regular soldiers, for the maintenance of a number of Alert units (*Bereitschaftstruppe*), in the strength of about 15,000. At the same time a unified army headquarters, which had hitherto not been allowed to exist, was created and the territorial organisation of units, hitherto strictly federal in character, redrawn on more functional lines.

Organisationally, the Austrian army is still in a state of flux, and resistance to the new scheme, from both within and without the army, seems by no means dead, but the probability is that it is now set on a course of gradual assimilation to the Swiss form, which may well turn out to be, as the Social Democrats claim, what is militarily best for a small, neutral, democratic and federal State on the alpine slopes of central Europe.

STRENGTH AND BUDGET

Population: 7,880,000

Army: 10,000 regulars; 23,000 conscripts; 690,000 reservists of whom 112,000 are effective; 11,250 paramilitary (gendarmerie)

Air force: 2300 regulars; 2000 conscripts; 700 reservists; the air force forms part of the army (*Bundesheer*)

GNP (1976 estimate): \$39,800,000,000

Defence expenditure (1977): \$534,000,000

World Armies

COMMAND AND CONSTITUTIONAL STATUS

Austria is a Federal State, but defence is administered by the Federal Government. The President is Supreme Commander of the *Bundesheer*, but the government delegates operational control (*Verfügungsrecht*) to the Minister of Defence, who personally exercises executive command (*Befehlsgewalt*). Until July 1st, 1973 he dealt directly with the commanders of the three *Gruppen* into which Austria was divided for purposes of military command and administration. Since then, however, there has existed an army headquarters (*Armeekommando*) within the Ministry of Defence, the head of which is the Army Commander, appointed by the Ministry of Defence, to whom he is responsible for the training, operational readiness and command of the army. The Corps and Air Force Commanders are his immediate subordinates.

Like other neutral European States, Austria has a plan and organisation for 'total defence' (*umfassenden Landesverteidigung*), comprehending military, civil, economic and psychological (*geistige*) defence, which is co-ordinated in the Federal Chancellor's department.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

Austria, by declaration of its parliament, is a 'perpetually neutral' State (October 26th, 1955). Her neutrality is not guaranteed by any of the four former occupying powers and is not enshrined in the State Treaty (May 15th, 1955) by which she regained her independence and sovereignty, but, by her government's reckoning, has been explicitly or implicitly recognised by 61 countries. Austria therefore belongs to no alliance system but, unlike Switzerland, is a member of the United Nations.

The principal role of the *Bundesheer*, therefore, is to defend Austrian neutrality which, it is recognised by ministerial resolution of May 11th, 1965, may be threatened in one or more of three ways: through an international crisis, such as that in Czechoslovakia in 1968 (*Krisenfall*); through a war between neighbouring States, when Austria might have to deny rights of passage to the combatants (*Neutralitätsfall*); through a direct attack on her territory (*Verteidigungsfall*). In the third, but not the other two cases, general mobilisation would be proclaimed, the fight would be opened as near the frontiers as possible and the aim would be to prevent at least the alpine area from falling to the aggressor.

Austria has, since 1960 (the Congo operation), also contributed contingents to United Nations peacekeeping forces. Because of her neutrality, this required a special law to be passed by the parliament; it provides for expeditions to be organised between the army and suitable volunteers from its ranks on a contractual basis.

Commitment

Austrian army and air units are committed wholly to defence of the national neutrality, on national soil, except for the volunteer battalions on United Nations duty. These at present consist of one battalion in Egypt, one battalion on the Golan Heights in Syria and one company and a field hospital in Cyprus; the first two supervise the Israeli-Arab, the last the Graeco-Turkish, ceasefire lines.

Deployment

Until 1972, Austria was divided into three Group (*Gruppen*) zones: western, north-eastern and south-eastern, whose boundaries followed those of the appropriate States (*Länder*), each of which contained a reserve (*Landwehr*) brigade as well as regular formations; the latter were formed into 10 brigades, of which three were for training only. Under the reorganisation of 1972/3, the *Landwehr* brigades remain, but the regular formations are being reduced to six, organised into two divisions, each subordinate to a corps (*Korps*) headquarters, which replaces the group organisation. As the reorganisation is still in progress, clarity requires that both organisations should be given, and they are as follows.

Old Organisation

Gruppe I (HQ Vienna; Lower Austria and Burgenland): 1st Infantry Brigade; 3rd and 9th Armoured Brigades; 2nd (Training) Brigade; Vienna, Lower Austria and Burgenland *Landwehr* Brigades.

Gruppe II (HQ Graz; Styria and Carinthia): 5th and 7th Infantry Brigades; 10th (Training) Brigade; Styria and Carinthia *Landwehr* Brigades.

Gruppe III (Upper Austria, Salzburg, Tirol and Vorarlberg): 4th Armoured Brigade; 6th Infantry Brigade; 8th (Training) Brigade; Upper Austria, Tirol and Salzburg *Landwehr* Brigades.

New Organisation

I Korps (HQ Graz): Styria, Burgenland, Lower Austria and Vienna *Landwehr* Brigades.

II Korps (HQ Salzburg): Tirol, Carinthia, Upper Austria, Salzburg and Vorarlberg *Landwehr* Brigades; plus six regular (*Bereitschaftstruppe*) brigades, of which the 3rd Armoured will belong to the 1st Panzergrenadier Division in *I Korps* and 1st Armoured and 2nd Infantry to the 2nd Jägerdivision in *II Korps*. The 1st Panzergrenadier Division will consist of the 3rd, 4th and 9th Panzergrenadier Brigades; its formation was announced on July 15th, 1975. The composition of the 2nd Jägerdivision has not yet been announced. Army headquarters is located in Vienna.

Recent Operations

The Austrian army reckons its concentrations on the eastern frontier (*Grenzsicherungen*) during the Hungarian and Czech crises of 1956 and 1968 as operational experience; it also undertook disaster relief in the mountains during the great floods of 1965. Apart from the activities of its volunteer battalions with the United Nations Emergency Forces, it has seen no other active service.

ORGANISATION

Arms of Service

These are: *Panzertruppen* (armour), which includes armoured reconnaissance (*Panzeraufklärung*), *Infanterie* (*Panzergrenadier* — armoured infantry; *Jäger* — infantry; *Hochgebirgstruppen* — alpine infantry), *Artillerie*, *Fliegerabwehrartillerie* (air defence), *Pioniere* (engineers), *Telegraphentruppen* (signals), *Sanitätstruppen* (medical), *Militärseelsorgedienst* (chaplains), and *Versorgungstruppen*, which includes *Nachschub-Transport* (transport), *Intendantz* (supply) and *Instandsetzung* (repair and maintenance); the air force is collectively known as *Fliegertruppen* and forms an integral part of the army.

Operational

The Austrian operational organisation is based on the brigade, which may be either mechanised (*Panzergrenadier*) or infantry (*Jäger*). Each consists of a headquarters (*Stab*) battalion, and artillery regiment (*Abteilung*) and three combat battalions, of which one is a training battalion; of the other two, both in the infantry brigade are infantry, but in the armoured brigade one is tank (*Panzer*) and one is mechanised infantry (*Panzergrenadier*). The infantry battalions have four companies, the tank and mechanised battalions three companies and the artillery regiments three batteries; in practice, each, since 1968, has been weaker than establishment by one company or battery. The headquarters battalion contains reconnaissance, signals, transport and medical units.

There also exist a number of independent armoured, engineer, signal and service units, some of which are in process of reduction, and three former brigades (Nos. 2, 8 and 10) which have been reduced to training regiments and may now be scheduled to disappear.

The *Landwehr* (territorial reserve) is organised on the basis of frontier-defence (*Grenzschutz*) or local-defence (*Sicherungs*) companies, which are subordinate to regiments or independent battalions.

Much of this organisation is still in force, despite the decision of 1971 to change it. When that change is complete, there will be only six brigades of regular (*Bereitschaft*) troops and eight brigades of *Landwehr*. The six regular brigades will be formed from volunteers and conscripts on extended service; the *Mobile Landwehr* will be formed from ordinary conscripts, led by regular officers and NCOs, and will act as a training organisation, but on mobilisation will in theory yield eight infantry brigades; the *Territoriale Landwehr* will be a reserve organisation of ex-conscripts, who will be liable for 60 days training spread over 13 years, and will form local defence units on mobilisation.

The air force, which forms part of the army and is largely regular, is organised into a flying (*Flieger*) and an air-defence (*Luftabwehr*) brigade. The former consists of a fighter-bomber wing (*Geschwader*) of three squadrons (*Staffeln*), a helicopter regiment of six squadrons (*Fliegerregiment 1*), and a training regiment (*Fliegerregiment 2*); the latter of three anti-aircraft gun battalions. There are air force bases at Langenlebarn, Linz, Zeltweg, Wiener Neustadt, Aigen im Ennstal and Graz-Thalerhof.

RECRUITMENT, TRAINING AND RESERVES

Recruitment

The original Armed Forces Law of 1955 made conscription universal and set the term of service at 9 months, but without provision for refresher training (a few days of reserve training were later instituted). Voluntary enlistment for longer periods, either in the officer or other ranks, was permitted. The new law of July 15th, 1971 reduced the period of conscription to 6 months, with liability for 60 days' refresher training in the *Landwehr* spread over 13 years. By volunteering to serve 8 months, conscripts can avoid refresher training (they thereby provide numbers for the regular formations); provision for voluntary regular enlistment remains.

World Armies

Training

Training has hitherto taken place in the third training battalion of the regular brigades or in one of the three training regiments (ex-brigades, Nos. 2 (Vienna), 8 (Salzburg) and 10 (Graz)). Henceforth it will take place in the appropriate provincial brigade of the *Mobile Landwehr*, to which conscripts will presumably continue to be drafted four times a year.

Regular officer training takes place at the *Maria Theresia Militär-Akademie* (founded 1752) at Wiener-Neustadt; the course lasts two years. The staff college (*Landesverteidigungsakademie*) is at Vienna; the course lasts 3 years.

Reserve officers have hitherto been trained in the *Einjährig-Freiwilligen-Kompanien* of the three training regiments, by volunteering to serve a full year of conscript duty. The new law perpetuates this system. But it is freely admitted that the system is imperfect, and that an adequate supply of reserve officers and NCOs may not be forthcoming.

Reserves

The Austrian system has consistently produced larger numbers of trained specialists than the reserve organisation can usefully employ, but insufficient infantrymen — the result of maintaining a standing force of all arms but a *Landwehr* of lightly equipped home-guard companies. Refresher training has, in consequence, been unpopular. The new system, which will train most conscripts as infantrymen, will rectify the imbalance, but it will leave the regular (*Bereitschaft*) brigades without a mobilisable reserve, and exaggerate the infantry character of the *Landwehr*, which will have an effective strength of about 120,000. Refresher training will be done in six periods of 10 days, either in the conscript's original *Mobile Landwehr* unit, which has a cadre of regular officers and NCOs, or in a company of the *Territoriale Landwehr*, which has none.

EQUIPMENT AND ARMS INDUSTRY

In imperial days, the Austrian arms industry, based on the Skoda works in what is now Czechoslovakia, was one of the most important in Europe; the state was self-sufficient in arms and exported heavy artillery and small arms. Of this industry, the Steyr combine (now Steyr-Daimler-Puch) remains, and, with VOEST, Linz, produces small arms and light armoured vehicles — though most of the production is of foreign models made under licence. The majority of Austrian heavy equipment is imported.

Pistol: Walther P38 9mm

Sub-machine-gun: MP-69 9mm (Steyr design and manufacture)

Rifle: StG-58 (Steyr version of 7.62mm FN)

Machine-gun: MG-42 7.62mm (Germany)

Heavy-machine-gun: M-2 0.5in (USA)

Mortar: L-16A1 81mm (Great Britain; 300 in service), M-2 107mm (USA; 107 in service) and M-30 120mm (USSR, Austrian built; 82 in service)

Anti-armour weapons: 74mm Miniman rocket-launcher (Sweden) and 66mm LAW rocket-launcher (USA); 84mm Carl Gustav recoilless weapon (Sweden) and M-40 recoilless rifle (USA; equips the anti-tank company of the infantry brigade and the anti-tank platoon of the infantry battalion); 85mm M-52 gun (Czechoslovakia; 240 in service; equips the *Landwehr* anti-tanks units)

Anti-aircraft weapons: M-58 20mm Oerlikon gun and M-65 35mm Oerlikon gun (Switzerland; equip the anti-aircraft batteries of the infantry brigades/battalions); M-42 40mm SP gun (USA; equips the anti-aircraft batteries of the *Panzergranadier* brigades); 55/57 40mm Bofors gun (Sweden; 59 in service equipping the anti-aircraft units of the *Landwehr*)

Artillery: M-2 105mm howitzer and M-1 155mm howitzer (USA; 130 in service equipping the infantry brigade artillery); M-109 SP howitzer (USA; 38 in service equipping the artillery of the *Panzergranadier* brigade)

Armour: *Kürassier* tank-destroyer (120 in service; a marriage of the French AMX-13 turret with 105mm gun and the Austrian Saurer APC chassis; equips two of the three independent *Panzer* battalions); Saurer 4K4F APC (Steyr-Puch-Daimler, Saurer-Werke, Vienna; 470 in service; 60km/h; crew 10; equips the *Panzergranadier* battalions); M-47 and M-60 tanks (USA; 320 in service equipping the *Panzer* battalions of the *Panzergranadier* brigades and one of the three independent *Panzer* battalions)

Aircraft: Saab 1050E fighter-bomber (Sweden; 38 in service equipping the fighter-bomber squadrons); Alouette II/III helicopters (France; 25 in service); Augusta-Bell 204 and 206 helicopters (USA; 36 in service)

RANK, DRESS AND DISTINCTIONS

Austria preserves her traditional titles of rank, several of which have counterparts in no other army (though the delightful imperial oddity, *Feldmarschalleutnant* (major-general), has disappeared).

<i>General</i> * (Major-General)	Three stars in a wreath
<i>Brigadier</i> * (Brigadier)	One star in a wreath
<i>Oberst</i> (Colonel)	Three stars on gold patch
<i>Oberstleutnant</i> (Lieutenant-Colonel)	Two stars on gold patch
<i>Major</i> (Major)	One star on gold patch
<i>Hauptmann</i> † (Captain)	Three stars
<i>Oberleutnant</i> (Lieutenant)	Two stars
<i>Leutnant</i> (2nd Lieutenant)	One star
<i>Fähnrich</i> (Officer-Cadet)	One star over broad and narrow stripe
<i>Vizeleutnant</i>	One star over broad stripe
<i>Offiziersstellvertreter</i>	Three stars over two narrow stripes
<i>Oberstabswachtmeister</i>	Two stars over two narrow stripes
<i>Stabswachtmeister</i>	One star over two narrow stripes
<i>Oberwachtmeister</i>	Two stars over one narrow stripe
<i>Wachtmeister</i>	One star over one narrow stripe
<i>Zugsführer</i>	Three stars
<i>Korporal</i>	Two stars
<i>Gefreiter</i>	One star

Notes:

* the Austrians consider that these ranks equate with higher ones in foreign armies, that *General* (*der Infanterie*, etc.) is a full general, *Brigadier* a major-general and the senior *Oberst* a brigadier;

† *Rittmeister* in the armoured formations; the multiplicity of NCO ranks makes them difficult to equate with British or American: *Vizeleutnant* is a senior warrant officer, *Zugsführer* or *Wachtmeister* a sergeant, *Gefreiter* a lance-corporal. Badges of rank are worn on a collar-patch.

Austrian officers wear a grey service dress similar to the West German *Bundeswehr*'s. The combat dress is mottled camouflage suiting, worn with the NATO helmet or a ski cap.

CURRENT DEVELOPMENTS

The Austrian high command itself does not attempt to disguise that the army is in disarray — though 'in a state of flux' is a form of words it would prefer. Its troubles have two root causes: (1) a shortage of funds — Austria spends less than 1% of GNP on defence and is reluctant to spend more because the necessary expenditure, for extra and more modern equipment, would have to be spent abroad; (2) an originally over-ambitious defence structure. Hindsight suggests that it would have been more sensible to have settled at the outset for a militia of the Swiss type, basing it perhaps on the traditions of the old *Tiroler Kaiserjäger*, which would have helped to commend militia service to the population (it is significant that the French *Chasseurs Alpins* and West German *Gebirgsjäger*, comparable organisations, are oversubscribed among the conscripts). The decision to organise instead a conventional, balanced all-arms force was understandable, in view of the imperial military tradition and of the apparent threat of invasion from across the eastern border, but it has resulted in an under-equipped and skeleton army and in the overproduction of specialists for whom no useful reserve employment can be found. The new army, consisting of a small regular combat force, a larger conscript militia and a reserve force of home guard companies is probably, as the high command argues, 'more in conformity with national requirements'. The main requirement is not to assure the defence of the country's frontiers, for given Austria's location, shape and size, the frontiers are indefensible against a superior aggressor; rather it is to organise the Austrian national will to defend her neutrality, even if in a hopeless battle, so that an aggressor will choose to avoid, rather than violate, her territory. But it will take some years before transition to the new organisation is complete, and longer than that to assess how warmly it has been accepted by the Austrian people.

JOHN KEEGAN

BAHRAIN

HISTORY AND INTRODUCTION

See the entry under United Arab Emirates for the history of all the Trucial States of the Gulf until 1971.

Since Bahrain gained independence in 1971, it has led a fairly untroubled existence. The one external security threat, a long-standing Iranian claim to the island which had been revived when Britain announced its departure from the Gulf, was quietly dropped by Iran after a referendum in 1970 overwhelmingly rejected union with Iran.

The ruling family, the al-Khalifas, have controlled Bahrain, with one brief interruption, since 1783, and the ramifications of kinship connections create a direct loyalty in most other leading families of the State. In a gesture towards establishing representative institutions for his increasingly sophisticated population, the Ruler held elections in December, 1972 for a constituent assembly, and a national assembly convened the next year in accordance with the provisions of the new Constitution. It was dissolved in August, 1975 however and various 'leftists' were arrested. There was very little popular reaction, and many of the so-called 'leftists' would not merit that description in most other parts of the world.

STRENGTH AND BUDGET

Total armed forces are 2300, all of them army. The budget in 1978 was \$43,000,000, a small proportion of the GNP of \$1,700,000,000. The population of Bahrain is 270,000.

COMMAND AND CONSTITUTIONAL STATUS

The Commander-in-Chief is the Ruler, Shaikh Isa bin Sulman al-Khalifa, KCMG. The Minister of Defence is Shaikh Hamad bin Isa al-Khalifa.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

The role of the army is solely internal security, in which it is assisted (or, at need, balanced) by the police force. It has no foreign commitments, no deployment abroad and no combat record.

The principal internal security threat to Bahrain is the large resident Iranian community, amounting to over half the total population, which is commercially prominent but almost totally excluded from the political/military power structure. The Ruler might find it difficult to retain control of some quarters of the capital city in the event of disturbances without Saudi help (which would undoubtedly be forthcoming). The real anxiety of the government, whether realistic or not, is that trouble with the Iranian community might cause or provide a pretext for an intervention by Iran.

Bahrain's only territorial dispute is with Qatar, which disputes Bahrain's right to the island of Huwar off the Qatari coast. The island is important because it affects the demarcation of territorial waters between the two States, and hence of possible sea-bed oil reserves.

Bahrain generally enjoys Saudi Arabian support in this dispute, and also depends on Saudi forces as a final reserve in case of trouble with the Iranian community. For this reason Bahrain has permitted Saudi Arabia to establish a major airbase at an old RAF airstrip south of the Awali-Zalaq road. The base, which is expected to become operational during 1978, has barracks, housing for Saudi air force officers and aircraft hangars, and will initially accommodate about 25 aircraft. It is Saudi Arabia's first military establishment beyond its own borders, and is integrated into the Saudi air-defence system.

At the time of the British withdrawal from the Gulf in the late 1960s, Bahrain offered the use of the base there to the United States navy instead. Limited American use of the base did follow, but following the 1973 Yom Kippur war the government asked the USA to vacate it. The agreement providing the United States Seventh Fleet with permanent port facilities for \$4,000,000 per year was terminated (by common consent) in June, 1977, but the United States Department of Defense continues to run a naval school in Bahrain, and United States navy ships continue to make use of the port facilities on an *ad hoc* basis about as frequently as before.

ORGANISATION

Arms of Service

The army consists of an infantry battalion and an armoured car squadron. There is also a coastguard.

Operational

Unknown.

RECRUITMENT, TRAINING AND RESERVES

There are some foreign officers on contract. The Iranian population is not significantly represented in the armed forces. There are no reserves.

EQUIPMENT AND ARMS INDUSTRY

The army has eight Saladin armoured cars and eight Ferret scout cars. Its fire support consists of eight Mobat 120 mm RCLs and six 81 mm mortars. The police dispose of five patrol launches and two Scout helicopters. In early 1978 two Cheverton fast patrol boats were ordered from Britain, and the coastguard already operates 20 patrol launches.

RANK, DRESS AND DISTINCTIONS

Rank structure and uniforms are similar to those in the other Gulf Shaikhdoms.

CURRENT DEVELOPMENTS

See comments under same section of the entry on United Arab Emirates, which are also largely applicable to Bahrain.

GWYNNE DYER

BANGLADESH

HISTORY AND INTRODUCTION

Bangladesh was born amidst vast carnage that exterminated a substantial proportion of the country's scanty educated *élite*. It is the large country of the world which stands closest to the Malthusian abyss, and a large body of opinion suspects that it may stand even closer to a political catastrophe of unparalleled scope. After less than 3 years of independence its civilian political institutions collapsed in ignominy and bloodshed, and only the army, itself a highly unstable organisation, now remains to defend the existing order.

At independence in 1971 Bangladesh was about the poorest country in the world. Literacy was less than 20%, one-quarter of all children died before the age of five, and over half of all families consumed less than the minimum acceptable daily intake of calories. The situation has since got worse, with food consumption continuing to decline, cloth consumption amounting to about one simple loincloth per person per year, and per capita income at the almost meaningless level of \$75.

The country is still only beginning the process of urbanisation, although the proportion of landless labourers in the countryside has risen to about 40%, and average farm size is 2 acres. Almost the entire country is a flat, fertile plain, much of it waterlogged for a large part of the year, but the population of 83,000,000 already creates a quite extraordinary pressure on the sole large economic resource: agriculture. The population is expected to double by the end of the century.

There are a few other areas of the world in almost as desperate an economic situation — some lie just across the Indian border, in West Bengal and Bihar provinces — but none so extensive, nor any which encompass an entire country. The creation of Bangladesh, a deprived agricultural area virtually bereft of any alternative resources, owes nothing to economic logic and everything to politics — in particular to communal politics based on religious divisions.

The emergence of a separate Muslim community within Bengal dates from the waves of conversion in the thirteenth and subsequent centuries, and by the period of British rule about two-thirds of the population in the eastern divisions of Bengal had long been Muslim, but they had never sought or achieved a political expression of their identity. As British rule approached its end, however, Bengali Muslims began to link up with those elsewhere in India, as the best strategy for opposing Hindu domination, although the Muslim League only replaced a local and quite separate party as the principal Muslim political party in Bengal in the early 1940s. From 1943, there was a Muslim League ministry in the province, and a rapid conversion of Muslims in Bengal (albeit even later than elsewhere) to the idea of Pakistan. (For details of the partition struggle, and the division of the old Indian Army between India and Pakistan, see the entries for those countries.)

In 1947 East Bengal became one of the five provinces of the new State of Pakistan, though it was more numerous than all the rest put together. From the beginning, however, there were immense differences between the two wings of the country. The traditions, customs, language and even the appearance of Bengalis were greatly different from those of West Pakistanis, and the two wings were not complementary in their economies. West Pakistan ended up almost entirely Muslim after the mutual massacres in the partitioned Punjab in 1947; East Bengal, where such communal slaughter did not occur, retained a 13% Hindu minority.

Tensions and misunderstandings were inevitable in such a relationship, especially when the two halves of the country were separated by a thousand miles of fundamentally hostile India. They were, however, greatly exacerbated by the fact that virtually the entire leadership cadre of the new State was located in the West, and operated, consciously or otherwise, with Western perspectives.

All the cities which were successively the capitals of united Pakistan (Karachi, Lahore and Islamabad) were located in the West, and the far superior educational levels of the Punjabis in particular guaranteed Western dominance in the federal civil service. Indeed, by 1948 an influx of Punjabi officials and merchants was already making its presence felt and resented in the East. Similarly, the army which Pakistan inherited from the Indian Empire was comprised almost exclusively of Punjabis and Pathans from the West wing, due to the recruitment patterns of its predecessor. Although the East Bengal Regiment (infantry) was subsequently raised in the Eastern wing, and limited numbers of Bengalis also joined other arms and services, the army remained overwhelmingly West Pakistani in its personnel and orientations down to the end of united Pakistan in 1971. Its Western perspectives were accentuated by the fact that the 1947 and 1965 wars with India over Kashmir were fought exclusively on the West Pakistani border, and little attention was given to the defence of the Eastern wing. From 1958, when the army seized power in Pakistan, this meant that all political decisions in the country were also being taken by West Pakistanis.

Even before that, the political domination of West Pakistan had begun to rouse powerful resentments in Bengal. As early as March, 1948 Muhammad Ali Jinnah, Pakistan's first leader, declared Urdu to be the country's official language (though widely spoken by the educated Muslims of northern India, it was spoken by less than 1% of East Pakistan's population). The making of a constitution for Pakistan was delayed for most of a decade, contributing greatly to the discrediting of

parliamentary democracy in the country, because of the determination of West Pakistanis that East Pakistan, though containing the majority of the population, should not be able to translate that directly into political power through the electoral system.

In 1958, the army seized power under General Ayub Khan, and East Pakistanis lost almost all political voice in federal affairs. Shortly afterwards Ayub dismissed his first choice as military governor in the East, General Azam Khan, who had enjoyed a certain local popularity, and from then almost to the end East Bengalis enjoyed very little voice in their own provincial affairs either. Amongst younger educated Bengalis resentment grew steadily against their effective exclusion from participation in federal politics, at what they saw as a gross imbalance between East and West in recruiting for the army and civil service, and against non-Bengali domination in commerce even in the East. There was massive vote-rigging in the East in 1965 when Ayub Khan had himself re-elected President, and in the war with India later that year East Pakistan was practically denuded of troops and left to rely on the Chinese deterrent for protection.

From almost the start of the protests in the East against the privileged position of the Urdu language, the leader of the dissidents was Sheikh Mujibur Rahman, a man of extremely modest administrative talents but possessed of a brilliant flair for mass politics. He was imprisoned by the central government when direct rule was imposed in the East in 1954, on the grounds that he was a secessionist, though at that time and for long after his actual programme was merely one of limiting federal power strictly to defence and foreign affairs, with the retention by each wing of its own economic resources.

Mujib was subsequently released from prison and founded the Awami (People's) League to further his cause, but its growing popularity caused Ayub Khan to imprison him again in 1966. Anti-federal and outright secessionist sentiment in East Pakistan, though forced underground by Ayub's dictatorial rule, continued to gain strength, and burst into the open shortly after he was forced to resign in February, 1969. (Indeed, riots in the East played a large role in unseating him, though the various grievances of West Pakistanis probably played a more effective role.) General Yahya Khan succeeded him as interim President, with a commitment to return the country to democratic rule, and in the elections of December, 1970 Sheikh Mujib's Awami League won an overwhelming victory in the East, taking 160 of its 162 seats in the federal parliament.

The new constitution provided for representation by population, so Mujib's victory gave him an overall majority in the National Assembly, and with it the right to become Prime Minister and implement his sweeping programme of reform leading to a far looser federal system. West Pakistanis reacted with horror, and Mr. Zulfikar Ali Bhutto, whose Pakistan People's Party had enjoyed almost as complete a victory in the Western wing, refused to participate in the new parliament unless Mujib drastically modified his proposals. Mujib refused, and General Yahya Khan, with Bhutto's encouragement, thereupon refused to summon the parliament until he gave way. At the beginning of March, 1971 negotiations broke down, and on the 10th the Awami League forced the issue by staging a *de facto* seizure of power in East Pakistan after a general strike by the police and civil service. General Yahya's government responded by sending three more Pakistan army divisions by sea to reinforce the single division permanently stationed in the East, a large part of whose personnel were Bengalis.

An officer of that division, Ziaur Rahman, was the first to rise in open revolt and proclaim the independence of Bangladesh at Chittagong on March 15th, 1971. Mujib was arrested at once and taken to West Pakistan, and the majority of Bengali officers and men in the Pakistan army, some 28,000 men, were disarmed and similarly interned in the Western wing. General Niazi, the Pakistani commander in the East, rapidly regained control of all major centres, but with only some 80,000 troops (more could not be sent, because Islamabad had to retain them for the defence of the West in case the crisis led to war with India) he was unable to suppress completely the guerrilla resistance that sprang up all over the country.

The campaign of repression quickly developed into an army-led pogrom which seemed to be aimed at eliminating virtually the entire educated Bengali *élite*. Niazi also recruited some 20,000 irregulars, the so-called 'Razakars', from the loyal, non-Bengali-speaking Bihari community which had emigrated from eastern parts of India in 1947, and this force was responsible for some of the most hideous massacres, particularly directed at the 9,000,000-strong Hindu minority. In the civil war which raged in East Pakistan between March and December, 1971 somewhere between 300,000 and 1,500,000 people were slaughtered, almost all of them Bengali-speakers and a very large proportion of them Hindus. By November about 10,000,000 refugees, including almost half the Hindus and amounting to one-seventh of the entire population, had fled across the border into India, where they continued to die amidst appalling conditions in the refugee camps that were hastily set up there.

The revolt's only hope for success from the first had been Indian intervention, but New Delhi prepared the ground carefully before acting. It encouraged the formation of guerrilla groups from amongst the refugees, the largest of them being the Mukhti Bahini, loyal to Mujib, and by the summer was arming them and sending them back across the frontier to harry the Pakistan army on a large scale, but the first tentative border crossings by the Indian army did not occur until late October. Indian forces were gradually built up on East Pakistan's frontiers, and finally, on December 4th, India struck with about eight divisions accompanied by some 50,000 Mukhti Bahini.

The fighting in the East lasted only 13 days, at the end of which all Pakistani forces there laid down their arms. There was also extensive fighting on the West Pakistan border, but Islamabad, faced with the impending transfer westward of the Indian forces that had been used in Bengal, accepted a ceasefire a day later. The People's Republic of Bangladesh was formally proclaimed (as a secular, not an Islamic, State), and rapidly received international recognition. (For further details on the 1971 war and the Mukhti Bahini's role, see Role, Commitment, Deployment and Recent Operations.)

World Armies

Sheikh Mujib was released by Pakistan in January, 1972 and returned as a national hero and 'Father of the Nation' to become Bangladesh's first Prime Minister. He inherited an immensely difficult situation, with the economy devastated, a large part of the Bengali administrative class exterminated (about 60% of the police force had been killed, for example), and the country flooded with weapons held by guerrilla groups that were often reluctant to disband. Despite his popularity he also had a hidden handicap that was to grow more visible with the passage of time: he was 'India's man', in a deeply Muslim country which had used New Delhi's support to gain its independence, but did not on the whole harbour tender sentiments towards its giant neighbour. When all charitable allowances have been made, however, Mujib did everything imaginable to make the situation even worse.

It proved quite impossible to establish order in the country under Mujib. The Mukhti Bahini itself was integrated into the army, demobilised, or transformed into a territorial force trained by the regular army, but in several areas of Bangladesh wartime guerrilla leaders refused to relinquish their weapons and reigned as local warlords. A notable example was the force led by Kader 'Tiger' Siddiqi, a former student and a supporter of Mujib, who controlled the entire Tergail district with his troops until 1975. There was sporadic terrorism from right-wing Islamic and pro-Pakistan groups, from the pro-Chinese wing of the National Awami Party, and from Maoists allied to the Naxalites of West Bengal.

Most important of all, as it turned out, was the defection of the radical wing of the Awami League in 1972 and its reconstitution as the Jatyo Sanajantrik Dal (JSD), which translates into English, rather unfortunately, as the National Socialist Party. It espoused an extreme version of social revolution, seeking the creation of a proletarian government based on 'the unity of the revolutionary soldiers, peasants, workers and students' which, in the view of many of its adherents, must be preceded by the wholesale massacre of the privileged educated classes. The JSD is rabidly anti-Indian, expects New Delhi to intervene against its revolution when it occurs, and believes that the best defence would be a 'people's army' based on local resistance. Even before it was forced underground in 1974, it had begun to pursue the strategy of creating its own clandestine People's Revolutionary Army (PRA) actually within the enlisted ranks of the regular Bangladesh army. The PRA was under the secret leadership of Colonel Abu Taher, a one-legged hero of the independence war who had been dismissed from the army in 1972 for his 'people's army' approach and his criticisms of Mujib.

Quite apart from the spreading subversion within its ranks, the full extent of which did not become evident until late 1975, the Bangladesh army suffered grievously from dissension within its officer corps. The root cause was the fact that the bulk of Bangladesh's potential regular army, the former Pakistan army regulars of Bengali origin, spent the first 2 years of independence imprisoned in former West Pakistan. In the meantime Bangladesh's army was created out of those former regulars who had evaded capture, plus a larger proportion of Mukhti Bahini fighters. The choice of who was to be incorporated into the army, and in what rank, was heavily influenced by the question of loyalty to Mujib and the Awami League (whence, probably, the PRA gained its initial secret adherents in the army after it split from the Awami League in 1972). When the 28,000 Bengali regular officers and soldiers returned from captivity in Pakistan in early 1974, they were generally forced to take posts and ranks beneath those who had previously been junior to them. Three full battalions of the East Bengal Regiment, one of the best in the Pakistan army, returned intact, but were deliberately split up and dispersed throughout the army.

In part it was merely defensive tactics on the part of those who were already enjoying the fruits of office, but there was unquestionably also a certain Indian influence at work. Both Mujib and his Indian patrons suspected that these returnees might be more sympathetic to Pakistan and Islam, and rather less enthusiastic about Bangladesh's status as an Indo-Soviet client, than they were themselves. Exactly the same form of discrimination was applied against Bengali civil servants who had served in the West before 1971, and who were now left out in the cold by Mujib, although their exclusion effectively deprived the country of half its scanty surviving supply of experienced administrators. Not only did this policy create a severe problem of factionalism within the army officer corps; in the way of such things, it operated as a self-fulfilling prophecy, guaranteeing that those falling under suspicion would nourish a bitter resentment against Mujib and his Indian protectors.

They were by no means alone in Bangladesh in displaying a rapid growth of anti-Indian feeling, for as Mujib's initial popularity in the country melted away in consequence of his corruption, autocratic methods and economic failure, he turned increasingly to India and its Soviet near-ally for support. The final Indian army withdrawal from Bangladesh began in March, 1972 and Mujib was confirmed as Prime Minister by a sweeping majority exactly a year later, but he never quite let go of the Indo-Soviet lifeline. He damned himself forever in the eyes of many Bengali nationalists by signing the Indo-Bangladesh Friendship Treaty of 1972, which allowed the Dacca government to call on Indian aid in the event of internal disturbances.

Indian army officers were employed as training advisers to his brutal party militia, the Rakkhi Bahini, at its main camp at Savar outside Dacca. The Soviet Union, the first major power to recognise Bangladesh after the war, sent advisers and aid, including some weapons; it also sent some 20 vessels under a Soviet Rear-Admiral to clear Chittagong port. (They managed to spin it out until they were expelled after the August, 1975 revolt, thus setting the record for the world's longest minesweeping operation.) Nationalist Bengalis began to see their country as less than fully independent, and much of army opinion, the extreme revolutionary left, the middle classes and the fundamentalist Islamic right, began to unite in opposition to Mujib and the Indo-Soviet link. Other factors contributing to this perception included the government's agreement to let India construct the Farakka barrage across the Ganges river just above Bangladesh's border (because of its potentially serious effects on agriculture in the country's western regions, Pakistan had never allowed this pre-1971), the

failure of India to return most of the weapons of the four Pakistani divisions that were captured in the East in 1971, and the large role of Mujib's close political associates in the rackets smuggling rice and jute into India, which brought the economy to the brink of total collapse.

As opposition mounted, Mujib defensively tied himself even closer to India and the Soviet Union. In October, 1973 the Awami League formed an alliance with the pro-Soviet wing of the National Awami Party and with the pro-Moscow Communist Party in a joint programme to 'suppress terrorism', and the role of the Rakkhi Bahini was expanded. Following floods and widespread famine the Government declared a state of emergency in December, 1974 and suspended all constitutional rights. At the end of January, 1975 the Awami League-dominated parliament adopted a new constitution replacing the parliamentary with the presidential form of government: Mujib became President, with absolute powers, and created a one-party State by expanding his own organisations to embrace his pro-Soviet allies in the Bangladesh Peasants' and Workers' Awami League and banning all other parties.

By now the price of rice had increased 400% since 1971, corruption continued to flourish, and popular antipathy to the government and anti-Indian feeling were rising rapidly. Moreover, Mujib had good reason to suspect that he had lost the support of the army, infiltrated at the bottom by the PRA and increasingly pervaded by anti-Mujib sentiments within the officer corps as the 'returnees' struggled to displace his own privileged appointees and supporters. In the spring of 1975 he took his final and fatal decision: to expand his own Rakkhi Bahini into a force which could overawe the army.

In July of 1975 this paramilitary party army numbered 25,000 men (against 55,000 in the regular armed forces), but it had already been enjoying priority in the acquisition of new arms for some time. By Mujib's decisions at that time, however, the armed forces were to be held to their existing strength, while the Rakkhi Bahini would be expanded to 130,000 men, with a brigade positioned in each of Bangladesh's 19 districts, and would receive almost all new equipment purchases for the foreseeable future. In view of the embarrassment caused by the Indian army's training mission it was decided that in future Rakkhi Bahini officers would receive their training in India, and in July a special Indian air force aircraft flew the first 100 cadets off to undergo a year-long course at Dehra Dun, India's military academy. But by simultaneously challenging the army's role and underlining his own status as an Indian puppet, Mujib had signed his death warrant.

On August 15th, 1975 a colonel and six majors from the regular army surrounded the Presidential compound in Dacca with about 200 soldiers and proceeded to massacre Mujib, his entire family (except two daughters then abroad in West Germany) and all his household staff. Elsewhere in Dacca several others of his relatives were murdered. Perhaps by prior arrangement, the rebel officers proclaimed Mujib's Commerce Minister, Khondakar Mushtaq Ahmed, as the new President, and took up residence in the Presidential palace with him in order to retain direct control of the government. The army high command evidently had no previous knowledge of the coup, but in order to preserve discipline it at once declared its loyalty to the new President. (Most senior officers were relieved to be rid of Mujib, and approved of the majors' anti-Indian, anti-Soviet attitudes, though they did force one of the leaders, Major Dalim, to retract his initial declaration of an Islamic Republic in Bangladesh.)

The new regime's first measures won it the favour of most of the army, the extreme left, and the Islamic right alike. Senior Awami League politicians who had been too closely associated with Mujib were imprisoned and the hated Rakkhi Bahini was disbanded (though elements of it secretly survive). President Ahmed promised to rescind the ban on other political parties in exactly 1 year's time, and to hold elections at the end of February, 1977. For the moment, he also managed to contain the tensions in the army between the returnees and the civil war veterans, though the young majors rapidly set about promoting their own friends and supporters, and Mujib's appointees clearly had reason to fear for their positions in the future. In any case, there was little the army high command or anyone else could do at the time, for the rebel officers were from the army's only two armoured regiments, and their tanks were all over the capital.

In foreign affairs, Bangladesh carried out a rapid and almost total reversal of alliances, to the general approval of the great majority of the population. Pakistan, which had formally recognised Bangladesh in 1974 but had kept its distance from what it saw as an Indian satellite, opened diplomatic relations with Dacca in October, and soon all sorts of closer links, especially in trade, were being discussed. China, who had hitherto withheld recognition for the same reason, instantly recognised the new government in August, 1975 and exchanged ambassadors with Bangladesh in October. Relations were also established for the first time with a number of conservative and oil-rich Arab countries, especially Saudi Arabia, through the mediation of Pakistan's Prime Minister Bhutto.

The Indians and Russians withdrew to the security of their embassies and awaited events, while a thick frost settled on relations between Dacca and its former patrons. But the situation was inherently unstable, with the army riven by factions, numbers of formerly pro-Indian officers fearing for their careers, and even perhaps their lives, the political scene littered with secret and often well-armed revolutionary groups, and a handful of inexperienced and rather isolated junior officers in charge. The inevitable counter-coup came on November 3rd, 1975. As expected, it was led by the late Mujib's pro-Indian former protégés within the officer corps.

According to some reports, the coup was triggered by the murder of Mujib's surviving cabinet colleagues in Dacca jail on the order of the ruling group of majors, which led former Mujib supporters in the army to act while they still could. The extent to which India was informed of the plot in advance, if at all, is not known, though there were unconfirmed reports at the time that five Indian divisions were mobilised on Bangladesh's frontiers to go to its aid if necessary. The coup was led by the Deputy Chief of the Army General Staff, Brigadier Khalid Musharaf, an officer of known pro-Indian sentiments who

World Armies

had commanded the Mukhti Bahini units in the Comilla sector during the independence war. He surrounded President Ahmed's residence with troops and forced his resignation; the young majors were sent into exile to Bangkok (whence they moved to Libya), and the Army Chief of Staff, General Zia Rahman, a war hero renowned for his vehement anti-Indian opinions, was placed under arrest. Musharaf appointed himself Army Chief of Staff in Zia's place, had the Chief Justice of the Supreme Court, Abusadat Muhammad Sayem, sworn in as President on November 6th, and proclaimed the rehabilitation of the late Mujib as Father of the Nation.

Given the almost universally anti-Indian opinions of all significant political groups in Bangladesh, and the fear that Musharaf would invoke the Indo-Bangladesh Friendship Treaty and call in the Indian army to secure his position, the counter-coup was bound to meet with widespread popular resistance. Given also the fact that the advantage in numbers within the army already lay by 1975 with those who had left the Pakistan army peacefully, rather than with the war veterans, it was almost certainly foredoomed. But the manner in which it was undone came as a great shock: the coup was destroyed by a mutiny of the army's rank and file which represented perhaps the most significant challenge to the subcontinent's established social order since the Sepoy Mutiny of 1857, and came within a hair's breadth of success in its goal of total revolution.

The PRA, the military wing of the JSD, has since claimed the support of 70% of the enlisted men in Bangladesh's army: the events of November 7th-11th, 1975 demonstrated that this claim, if somewhat exaggerated, contains a considerable element of truth. As soon as Musharaf's coup occurred, the JSD leadership set its PRA cadres within the army into motion, distributing leaflets in the military cantonments on November 5th and 6th urging the private soldiers to attack their officers and overthrow the intriguers who had seized power. The mutiny it unleashed was to be aimed not just at removing the pro-Indian Khalid Musharaf, but at creating a general uprising against 'the bourgeois upper echelons of the officer corps and the bourgeoisie itself'.

The mutinies that broke out in army garrisons throughout the country on November 7th were only partly under JSD-PRA control, with many other soldiers just reacting to Islamic nationalism and anti-Indian fears. The Dacca Brigade's enlisted men were, however, largely under the control of Colonel Abu Taher, the head of the PRA, who emerged from hiding to lead their mutiny. Between 40 and 60 officers were massacred in Dacca alone (2-3% of the entire officer corps), and General Khalid Musharaf and his aides were killed by a PRA group while fleeing towards the airport. Colonel Abu Taher released General Zia Rahman, reinstated him as Army Chief of Staff, and presented him with the PRA's 'Twelve Demands' for wholesale revolutionary change within the army.

The first Demand, addressed to Zia himself, read: 'Our revolution is not for changing leadership only. This revolution is only for the interest of the poorer class. We have accepted you as our leader in this revolution. For that reason, you are to express very clearly that you are the leader of the poorer class. And for that, you are to change the structure of the armed forces.' Amongst the changes demanded to achieve the transformation from the 'army of the rich' to the 'army of the poor' were the abolition of all officer-man distinctions, and the creation of a rankless army on what the JSD imagines to be the Chinese pattern.

General Zia temporised, and was aided by the fact that most units outside Dacca were content to stop with overthrowing Khalid Musharaf. As Colonel Abu Taher himself admitted, given the short time available, the PRA had been unable to take control of the mutiny in most units. By November 9th Zia felt confident enough to ban a JSD rally in Dacca, and Taher went underground again. Two days later Zia made a nationwide speech condemning those who had tried to use his name 'for certain purposes', and making clear that his break with the JSD was complete. He succeeded, by the skin of his teeth, in re-establishing a semblance of central control over the army, but the educated and privileged minority which corporately runs Bangladesh had had a horrifying glimpse of the 'pit that lies only inches beneath the seemingly solid ground under their feet'.

Since November, 1975 there has been no surviving real possibility of a pro-Indian reversal in Bangladesh's internal politics, but the process of re-establishing discipline within the army, the only remaining pillar of authority in the country, has been delicate, difficult and even now is by no means certain of success. In the aftermath of the November events Abusadat Muhammad Sayem was left as President, with real power lying in the hands of the three service chiefs as Deputy Chief Martial Law Administrators: Zia for the army, Commodore Musharaf Hussain Khan for the navy, and Air Vice-Marshal M. G. Tawab for the air force. Zia from the first was *primus inter pares*, but his colleagues were equally anti-Indian: A. V. M. Tawab once described himself as being 'obsessed' with Indian interference in Bangladesh politics.

The most urgent priority was that of re-establishing the chain of command within the officer corps, and reasserting officers' authority over the private soldiers who had tasted power in November, 1975. The first few months were studded with recurrent abortive coups from within the faction-ridden officer corps, which included such bizarre events as a group of junior officers locking themselves inside their tanks and charging across the Dacca cantonment in an attempt to overthrow Zia. In the crisis of December 23rd, however, the army commander succeeded in forcing the withdrawal of the tanks which had ringed Dacca since Mujib's death to their depot at Bogra, 100 miles and several river crossings away.

General Zia Rahman's showdown with his rebellious junior officers came in April, 1976 when four of the majors who had led the original coup against Mujib suddenly returned from their Libyan exile and joined their comrades at the armoured depot at Bogra. With the support of Air Vice-Marshal Tawab, they demanded a share of political power and the transformation of Bangladesh into an Islamic republic. The officers of the two armoured regiments, the Bengal Lancers and the 1st Bengal Cavalry, mutinied when ordered to surrender the returned exiles, but General Zia succeeded in re-

establishing control over the units in early May.

Air Vice-Marshal Tawab was dismissed, and the Begal Lancers, the more deeply implicated unit, was disbanded and about half its 500 members brought up on disciplinary charges. Since then open dissension within the officer corps has died down, although the bitter returnee-veteran dispute and other factional quarrels continue behind the scenes. The best gauge of the high command's present control over the officer corps is the fact that General Zia was able to force the rebel officers to return to exile, but in July felt it necessary to give all but two of the 13 exiles diplomatic posts abroad in recognition of the continuing strength of their supporters within the army.

Re-establishing control over the rank and file, and cutting away at the influence of the JSD, has proven an even more difficult task. Thousands of JSD members have been rounded up, and in mid-1976 the PRA commander, Colonel Abu Taher, was arrested, tried for sedition and rebellion, and hanged. But the PRA retains a major influence within the enlisted ranks: there are still recurrent scattered incidents of strikes and mutinies within various units, often with senior NCOs as ringleaders, and instances of individual indiscipline — private soldiers refusing to stand to attention before officers, or disobeying orders they disapprove of — are manifold. The demands for a 'classless army' have not disappeared.

STRENGTH AND BUDGET

The Bangladesh army numbers 65,000 men, and also has under its command a paramilitary border security force of 20,000 men known as the Bangladesh Rifles. The navy has approximately 3500 men, and the air force 5000. The total armed forces strength of 71,000 represents a 270% increase since 1974, which mainly reflects the incorporation of ex-Pakistan army returnees since that time. The population of Bangladesh is 80,000,000.

The 1977-8 defence budget was \$151,000,000, a startling 200% increase over the 1975-6 defence budget, but it may well be that Bangladesh deliberately understated earlier expenditure. There are those who suspect that Bangladesh finds it more tactful to understate its defence expenses in view of its extremely high dependence on foreign aid and the possible adverse impression that the inflation of arms expenditure would create amongst the donors.

COMMAND AND CONSTITUTIONAL STATUS

The three services are commanded by their respective chiefs of staff, who are nominally co-equal, but in fact the Army Chief of Staff invariably and inevitably predominates because of his service's preponderant size. Under the martial law which has prevailed since 1975, the three chiefs of staff were theoretically all equal deputies to the President, who was Chief Martial Law Administrator. In November, 1976 however, the President transferred that office to the Army Chief of Staff, leaving himself only the ceremonial functions of civilian head of state, and effectively placing the other service chiefs in a subordinate position. This was largely cosmetic, as in fact the army commander had been ruling the country ever since late 1975. The true political situation was recognised in the presidential election of June, 1978 in which General Zia Rahman received 80% of the poll.

The Chief of Naval Staff is Rear-Admiral Mosharraf Hossain Khan and the Chief of Air Staff is Air Vice-Marshal Muhammad Khademul Bashar; since late 1977 they are no longer Deputy Chief Martial Law Administrators as well.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

The Bangladesh army's principal roles, as discussed elsewhere, are internal security and, increasingly, the direct administration of the country's political life. In so far as it has an external role, both geography and political developments since 1975 designate India as Bangladesh's only possible enemy. Despite the tense relationship that prevailed between Dacca and New Delhi until recently, and the recurrent border clashes between the Bangladesh Rifles and Indian-backed guerrillas, however, the Bangladesh army has no serious pretensions to being able to defend the country against an Indian attack. This fact is reflected not only in its size, but in the scale and nature of its equipment, which is primarily only suitable for internal security operations.

This fact imposes a certain discretion on the Dacca government in its dealings with New Delhi, whatever the degree of hostility towards India that may prevail in Dacca. There are, nevertheless, certain real disincentives to an Indian invasion beyond those of political morality and international public relations. One is the Chinese military deterrent against such an Indian adventure, made available to Bangladesh because Peking views the subcontinent almost exclusively from the standpoint of wishing to confine Russian influence there. The other is the certainty of large-scale guerrilla resistance even after an Indian victory.

India has been seen by China as a Soviet near-ally since 1965 (although this may now be changing), and for that reason Chinese recognition of Bangladesh was withheld so long as Indian influence predominated in the country. Chinese sources

World Armies

have since revealed, however, that there were small-scale armed clashes on the Sino-Indian border both east and west of Nepal during August, 1975 at the time of the coup against Mujib which overthrew Indian influence in Bangladesh — 'second-class Ussuri River incidents', in the words of one Chinese official. It may not be going too far to suppose that these were staged by the Chinese to warn the Indians against seeking to intervene militarily in Bangladesh. It is certainly the case that the Chinese subsequently heavily reinforced their military strength along the Sikkim-Bhutan border area, where Indian territory between Bangladesh and Tibet narrows at one point to a mere 60-odd miles. (It is by no means certain, however, that the Chinese would be prepared actually to commit their forces to war against India even in aid of Bangladesh, as the logistical situation would hardly be in their favour.)

The second major disincentive to an Indian invasion is the fact that, although the Indian army could unquestionably walk over the Bangladesh regular forces, and under certain circumstances might be able to do so without facing intervention even from China, it would then face an unending guerrilla war in a hostile and densely populated countryside. Indeed, it is this logic, as much as political or ideological considerations, which impels the JSD to argue for the abolition of the regular army and its replacement by a mass 'people's army' organised for guerrilla resistance. The deterrent effect on India of the fact that successful invasion would merely be the opening of a protracted and probably unwinnable guerrilla war is not to be underestimated, especially since the political orientations and purpose of the guerrilla leadership most likely to emerge could easily prove to be a communicable disease, capable of infecting similar impoverished areas of eastern India.

None of this should be taken to suggest that India has actively contemplated military intervention in Bangladesh at any time since 1975, though its disappointment at Mujib's overthrow and the reorientation of Bangladesh's foreign policy was acute. These are, however, the basic calculations made in Bangladesh whenever the question of defending the country against its giant neighbour is considered.

Commitment and Deployment

The Bangladesh armed forces have no military commitments beyond their own frontiers. No Bangladesh troops are deployed outside the country.

Recent Operations

The bulk of the regular officers and men of Bengali origin in the Pakistan army were disarmed and interned at the very beginning of the revolt in East Pakistan in March, 1971 and sat out the war in West Pakistan. Those who remained free fought together with the guerrilla forces, principally the Mukhti Bahini, which were formed with New Delhi's aid on Indian territory during the remainder of that year. Some 50,000 Mukhti Bahini accompanied the Indian army when it crossed East Pakistan's borders in around 20 columns on December 4th, 1971 but they mostly played an auxiliary role as guides, interpreters and rear-area security forces in the rapid Indian advance that followed.

Indian army forces in the east were about 160,000 strong, giving them a two-to-one advantage over the Pakistan army defenders, who suffered the additional handicap of having to fight while surrounded by a hostile population. The Indians also enjoyed complete air superiority from the first day, and were much more mobile thanks to a more lavish scale of transport. As a result, the campaign was not so much one of direct military confrontations, in which the Mukhti Bahini might have got more involved, but rather a series of rapid Indian flanking manoeuvres which enveloped the static Pakistan army garrisons. Indian troops gained the two principal rivers, the main defensive line chosen by General Niazi, the Pakistani commander, before Niazi's own troops could fall back on them, and were closing in on Dacca by the middle of the second week of fighting. Pakistan army morale, already shaky because of universal popular hostility, the certainty that no further help could be sent from the West, and the inevitability of eventual defeat, abruptly collapsed under these blows, and General Niazi surrendered his whole force of 85,000 men on December 16th, 1971.

The Mukhti Bahini was a great diplomatic asset to the Indians during the brief occupation period, helping moderate the inevitable frictions by acting as a buffer between foreign, mostly Hindu, troops and a prostrate and starving Muslim countryside. Some of its members had already been transformed into the core of the new Bangladesh army by the time the Indian withdrawal was completed in early 1972.

The Bangladesh army as such has never fought a war, but since December, 1975 it has been involved extensively in internal and border security operations (though its paramilitary adjunct, the Bangladesh Rifles, has borne the brunt of the latter). Its opponents, according to the Bangladesh government, have been pro-Mujib elements and non-Bengali tribal groups, in both cases armed and supported by India.

The first border incidents occurred in the months following Mujib's overthrow in August, 1975 mainly in the west and the south-east, but really serious trouble began on January 19th, 1976 with a series of co-ordinated assaults by guerrillas on dozens of Bangladesh Rifles and police posts lasting a week. These and subsequent assaults received supporting fire from the Indian Border Security Forces, whose Director-General was seriously wounded in one such exchange of fire in April, 1976. Dacca reported in January, 1977 that the IBSF had opened fire on Bangladesh border posts on 1316 occasions in the preceding year. General Zia Rahman has stated that several hundred guerrillas have been captured along the frontier with India, and have admitted that they were trained by Indian troops, in some cases as far away as Calcutta. In all there are some

30–50 guerrilla bases around the Bangladesh border, stated the General, with the Indian training camps run by the IBSF mainly concentrated in the northern area opposite Mymensingh.

Mymensingh province is also the location of the main internal guerrilla base area, run by Kader Siddiqi, a former student leader and 1971 guerrilla leader who has proclaimed his loyalty to the memory of Shaikh Mujib. He claims 30,000 followers, but the Dacca government estimates that his following of 'miscreants' is around 3000–3500. They are drawn mainly from the local Garo tribe, non-Bengali and mostly Christian, who straddle the Bangladesh–Assam border (there are about 40,000 within Bangladesh) and whom the guerrillas have promised an autonomous Garoland within Bangladesh. A similar insurgency exists at the other end of the country in the Chittagong Hill Tract, based mainly on the Buddhist Chakma tribe, of Burmese origin. Dacca has accused India of supplying arms and aid to both. During 1978 this resistance developed into full-scale guerrilla war, and a counter-insurgency campaign has been launched.

Both the border incursions and the internal insurgencies seem well under control, and have not placed the Bangladesh army under any major strain. Though they have a certain nuisance value, it is difficult to envisage them actually threatening the present political order in Bangladesh, or even affecting in a significant way any future changes which it might undergo. The change of government in New Delhi in early 1977 has evidently brought an end to Indian support for domestic insurgents.

ORGANISATION

Arms of Service

The Bangladesh army is institutionally a fourth-generation descendant of the British army, by way of the armies of the Indian Empire and of Pakistan (with the modern Indian army as presiding midwife at the birth). The principal arms — infantry, armour, artillery and engineers — duplicate the British pattern, as do also the various services. A modified version of the British pattern of regimental organisation prevails within the arms, but the regimental lineages do not in general extend back beyond 1971.

The navy and air force (officially, the Air Wing of the Defence Forces) were both founded in 1972, and also conform largely to the inherited form of organisation. The paramilitary border defence force, the Bangladesh Rifles, is organised along the same lines as the regular infantry.

Operational

The army is organised into eleven infantry brigades, one tank regiment, five artillery and two heavy mortar regiments, and three engineer battalions. There are five infantry divisional headquarters organisations in existence. Army headquarters are in Dacca, and the main tank depot is at Bogra; infantry units are distributed throughout the country.

The very small navy has its headquarters in Dacca, with its principal naval base in Chittagong. There is also a smaller base at Khulna.

The air force consists of one fighter squadron, one transport squadron, one helicopter squadron, and a training organisation disposing of a handful of aircraft. There are a number of airfields and landing strips designated as air force bases — Barisal, Chiringa, Chittagong, Cox's Bazaar, Dohazari, Hathazari, Ishurdi, Jessore, Kurmitola, Lalmonirhat, Saidpur and Tazgaon — but most of the air force's strength is in fact at Dacca, where the headquarters are also located.

RECRUITMENT, TRAINING AND RESERVES

Recruitment is by voluntary enlistment. Army recruiters can afford to be highly selective since the armed forces incorporate less than 0.1% of the population, and offer one of the most secure and well-rewarded occupations in the country.

Military training takes place almost entirely within Bangladesh since 1975 (previously there was some co-operation with the Indian army), and conforms to the usual pattern. There has recently been a strong emphasis on discipline and such morale-building incidentals as drill, smart new uniforms, and distinctive regimental marks, in an attempt to counteract the corrosive effects of the 1975 mutiny and subsequent effervescences on the army's cohesion and obedience.

There is no organised reserve system, except for the 36,000 strong Armed Police Reserve. The government has eschewed the creation of a popular militia, presumably because of its resemblance to the JSD–PRA concept of a 'people's army', and its vulnerability to penetration by that sort of subversive group.

EQUIPMENT AND ARMS INDUSTRY

The army has 30 Soviet T-54 medium tanks, and 30 105 mm and five 25 pounder gun/howitzers. It also possesses some

World Armies

81 mm and 50 120 mm mortars and a number of 106 mm RCLs. Spares are short, some of the equipment is unserviceable, and even ammunition was so scarce in early 1976 that infantry officers were ordered to restrict target practice severely.

The Bangladesh navy has two large ships, both bought second-hand from Britain. It also has four patrol craft, five armed river patrol craft, and one support vessel.

The air force officially has 11 MiG-21 fighters, but four were reported destroyed by mutineers during the events of October, 1977 and the rest may be grounded due to an acute shortage of spare parts. The transport squadron operates a few AN-24 and AN-26 aircraft, while the helicopter squadron has four Alouette III, two Wessex, eight Mi-8 and six Bell 212 helicopters. There are eight trainers.

For armed forces the size of Bangladesh's, this must be one of lowest scales of equipment in the world. It reflects not only the extreme poverty of the country, but also its brief but chequered political history. Bangladesh inherited little equipment from the Pakistan army units which surrendered on its soil in 1971 (though it did manage to salvage a few ex-Pakistan Sabre 6s, now non-operational, with which to found its air force.) In late 1972-4 the armed forces did receive modest deliveries of Soviet arms, which still comprise the bulk of their holdings, but a large share of military expenditure in those years was devoted to building up their now defunct paramilitary rival, the Rakkhi Bahini. Since the coup of August, 1975 Indian or Soviet arms have of course become unavailable, and an acute problem has arisen over the supply of spares for the armed forces' existing Soviet equipment.

The Bangladesh government, however, sees an urgent requirement for increasing and modernising its weapons, partly because it is presently unable to present even a minimal military deterrent to India, but even more because of the need to rebuild the armed forces' morale and self-respect. Since November, 1975 therefore, it has been in contact with China, Pakistan, Britain, West Germany, Libya and several other Muslim States in its search for arms. In mid-1976 a military mission was sent to the United States with an extremely optimistic shopping list that included 40-50F-5 fighter-bombers, surface-to-air missiles, anti-aircraft guns, artillery, small arms, communications equipment and radars. Thus far, however, Bangladesh has only succeeded in acquiring two frigates, from Britain.

Bangladesh faces an unusual and delicate problem in seeking to buy arms abroad (apart from the fact that most arms suppliers are loth to annoy far larger India, which has vocally disapproved of Dacca's arms-buying ambitions, pointing out that there is no-one Bangladesh could use them against except India). Dacca's special problem stems from the fact that an extraordinarily large part of its income comes from foreign loans and grants, which are given mainly because of its great poverty. If large amounts of government expenditure were diverted to arms purchases, it would have a powerful negative effect on the willingness of foreign donors to supply more aid (especially since sales of grain sent as aid generate a very large share — figures of between 50 and 90% are quoted — of government revenue). It is hard to see how this difficulty can be circumvented by Bangladesh's government, so the prospects for the desired dramatic improvement in armed forces equipment seem less than bright.

There is no arms industry in Bangladesh.

RANK, DRESS AND DISTINCTIONS

Ranks and uniforms in the Bangladesh armed forces follow the basic British patterns adopted by the Indian and Pakistani forces. No information is available on distinctions for gallantry.

CURRENT DEVELOPMENTS

No-one given the task of designing a country would put it where Bangladesh is (typhoons, tidal waves, one-third of the country regularly flooded each year). Neither would they people it so liberally, nor endow its people with such a volatile and anarchic temperament. Despite the temporary, dramatic improvements in Bangladesh's position that can be wrought by a series of good monsoons unaccompanied by the usual natural disasters — a 12% growth rate was recorded in 1975-6 — the country does largely merit its image as the international basketcase, the Malthusian nightmare on the brink of coming true.

What is less widely recognised is that such a disaster cannot approach, much less occur, without the most drastic political consequences. It is true that the chronic malnutrition from which two-thirds of the population suffers in normal times, not to mention the more severe effects of actual famine, tends to produce not revolt but rather passive acceptance of suffering. Nevertheless, there must inevitably be large numbers whose acute deprivation does not utterly incapacitate them, and who remain capable of the most violent reactions against those who do not share their lot. It is the prevailing, and probably accurate, perception of the narrow *élite* of educated and privileged Bangladeshis — there are perhaps 150,000 potential taxpayers in a nation of 80,000,000 — that the country faces the possibility of cataclysmic social revolution.

This perception, rather than India, defines the army's principal role: defence of the social order. The judgement was reinforced by the experience of November, 1975 which revealed that the enlisted ranks of the army had been penetrated to an astonishing degree by the JSD, perhaps the likeliest agent of such an upheaval (though there are other candidates). Since

then there has been a thorough-going round-up of JSD cadres in the cities, and a determined effort to evict PRA adherents from the army, but it is by no means certain that the organisation has been decisively crippled.

In domestic affairs, General Zia has taken a liberal economic line, and the efficiency and honesty of the civil service has been dramatically improved. Bengali ex-members of the Pakistan Civil Service have been given jobs again, and the government takes great care to satisfy, as far as possible, the often competing demands of the army, civil service and police for enhanced career opportunities. Public security in the towns and countryside has been greatly improved.

In foreign relations, the government has followed a firmly anti-Indian line, maintaining close links with Pakistan (the re-establishment of former economic links — on a more equitable basis — has been strongly encouraged by both governments) and with China. Bangladesh has also turned to the West diplomatically, and has sought to make substantial arms purchases from Western countries (with the primary purpose of restoring the morale of the badly equipped armed forces).

Bangladesh's relations with India after the overthrow of Mujib and the failure of the counter-coup were bound to be bad, but from the end of 1975 they were made far worse by an apparently deliberate Indian policy of arming and supporting anti-Dacca guerrillas along and within the frontiers. The guerrillas were mainly drawn from those pro-Mujib refugees who fled the country in August, 1975 but India did not actually permit them to begin operations until after the failure of the November counter-coup. For some time afterwards border clashes were continual, occasioning several dozen casualties a month in Bangladesh, and Dacca claimed that the Indian Border Security Forces frequently provided the guerrillas' attacks with covering fire from across the border. It also accused India of providing aid to two guerrilla forces within the country, one led by Mujib's former supporter 'Tiger' Siddiqi in the northern region around Mymensingh, and the other in the Chittagong Hill Tract near the Burmese border: Bangladesh reported the seizure of some 6000 weapons that had come across the border from India during 1976. India denied all these accusations, of course, and as late as January, 1977 Bangladesh-Indian talks on the problem ended in deadlock. (For further details on the border clashes and internal security operations, see Role, Commitment, Deployment and Recent Operations.)

Other irritants to Bangladesh-Indian relations have included the wounding of the Indian High Commissioner in Dacca by six JSD gunmen in November, 1975 and the rabidly anti-Indian tone of the controlled Bangladesh press, but the most important recent issue is unquestionably that of the Farakka dam. India extracted Bangladesh's consent to this \$200,000,000 project during Mujib's rule, and it was completed 4 months after his death. It is located 11 miles above the point where the Ganges river enters Bangladesh, and its purpose is to divert much of the river's water westwards into its former main channel, the Hooghly river, from which the flow shifted in the seventeenth century, in order to deal with the severe problems of silting in Calcutta harbour 150 miles to the south. During the first dry season of its operation during 1976, however, this diversion had devastating effects on irrigation projects, industry and river navigation in the western districts of Bangladesh that depend mainly on the Ganges water, and Dacca accused India of 'an act of aggression against the economic sovereignty of Bangladesh'. Salt water moved far up the mouth of the Ganges, cutting the fish catch which is Bangladesh's main source of protein, the rice crop was badly affected, and electrical power production was crippled throughout the south-west of the country. Negotiations with India on this issue began in September, 1976 but made no early progress. Bangladesh subsequently went to the United Nations on this question, which General Zia termed 'a matter of survival'. An interim 5 year agreement on the sharing of the Ganges water was reached by India and Bangladesh in 1977.

India's strained relations with Bangladesh are understandable, in view of the fact that all major political groups within the country — the pro-Western military and educated civilian *élite*, the Islamic extreme right, the pro-Chinese communists, and the JSD — vie with each other in expressing their hostility towards India. Nevertheless India would be remarkably ill-advised in assisting any movement which seeks to displace the present government of Bangladesh, since one of the possible consequences would be precisely the social explosion the Bangladesh *élite* fears. The neighbouring regions of India are amongst the most poverty-stricken in that country, containing a population of some 200,000,000, 40% of whom, as in Bangladesh, are landless peasants, and revolution can be infectious even across frontiers. It is possible, of course, that with the change of government in New Delhi as a result of the March, 1977 elections, Indian policy towards Bangladesh will also change, and that India will gracefully resign itself to the loss of its influence in that nation.

Despite the apparent gradual improvement in the army's cohesion and discipline and in the state of public security over the course of 1976, General Zia finally balked at the decision to return the country to democratic rule. The ban on political parties was duly lifted in August, 1976 in fulfilment of the promise made a year before, and elections were announced for February of the following year. No sooner had the parties reorganised themselves and begun their campaigns, however, than all the familiar signs of instability and inveterate factionalism in Bengali politics began to reappear; in mid-November, there, General Zia announced the indefinite postponement of the elections.

Faced with a strong reaction from the civilian political parties, Zia had the President transfer the office of Chief Martial Law Administrator to himself on November 29th, and promptly arrested most leading politicians including former President Khondaker Mushtaq Ahmed for 'prejudicial activities against the State'. They were subsequently awarded lengthy jail sentences.

The internal discipline and cohesion of the Bangladesh army is still far from restored, but it appears capable of maintaining order within the country at large. Both the towns and the countryside are far safer than they have been at any time since independence, despite the very large quantities of arms that still remain in private hands as a legacy of the 1971

World Armies

war. The President and Chief of the General Staff, General Zia Rahman, is an intelligent and relatively young man of unimpeachable honesty, and in the past couple of years the economy has benefited from unusually kind natural conditions.

The officer corps, however, continues to be riven by factions and is probably still coup-prone. Up to 75 junior officers were secretly tried and sentenced to imprisonment in 1976–7, and the continuing strength of the JSD in the enlisted ranks was shown by the events of September–October, 1977. On September 30th an army unit at Bogra mutinied, killing at least two officers; 2 days later, while the government's attention was distracted by negotiations with Japanese Red Army terrorists holding a hijacked jet at Dacca airport, there was a spontaneous uprising by airmen against their officers. The mutineers shot 11 officers, including six of Bangladesh's few fighter pilots, and the fighting spread to the airport and the main Dacca army cantonment's officer quarters before the mutineers were slaughtered by a loyal infantry unit. As many as 230 people, mostly military personnel, were killed in the fighting.

A number of senior air force officers were compulsorily retired in the following weeks, the army headquarters staff were reshuffled and the air force and navy commanders were relieved of their positions as Deputy Chief Martial Law Administrators. In late October, 1977 the government announced that 37 members of the army and air force had been executed for their parts in the affair, but unofficial reports suggest that up to 800 servicemen were convicted by secret military tribunals in the following 6 months, of whom 600, mostly from the air force, were executed by firing squad or hanging in Dacca. It is to be doubted whether even these measures will fully restore the control of the officer corps over the JSD-infiltrated ranks, especially if the command's tenuous authority should be shaken by a coup attempt from within the officer corps, or by one of Bangladesh's recurrent natural disasters.

Presidential elections were held in Bangladesh in June, 1978. Martial law was ended after the elections for a National Assembly, held in February, 1979. The dominant party in the Assembly is the recently formed Bangladesh National Party, the personal political vehicle of General Zia.

GWYNNE DYER

BELGIUM

HISTORY AND INTRODUCTION

In 1815 the 'powers' sought to create a 'buffer' State between France and Germany by combining the former Spanish Netherlands with the Dutch Netherlands. This uneasy political arrangement only lasted until 1831, when Belgium became an independent State. The powers intended to guarantee the new kingdom's perpetual neutrality and this suited the Belgians; after all, their country had been used as a battlefield by warring powers for several centuries.

Initially, it was hoped in Brussels that a neutralist policy would avoid the need for armed forces, but it was soon realised that something more than the *Garde Civique* was required to secure the newly founded nation. Soon after Leopold of Saxe-Coburg was canonised the first King of the Belgians, he had the task, as Commander-in-Chief, of raising an army. It was formed on a selective basis: 'that is, young men had to register for service, but only about a quarter of each year's intake were called up; and those who found it inconvenient to serve were allowed to put forward substitutes'*.

Belgium occupied an area of Europe of outstanding strategic importance and longstanding vulnerability; its strategic significance stemmed from its position astride a main route between France and Germany, rather than from its size. It was, and still is, a small and densely populated country, measuring little more than 150 miles across from north to south and east to west. The Belgians, as a nation, were divided among themselves territorially, linguistically, and to a certain extent, culturally†. The 50 mile coastline was Belgium's only natural frontier, but the hilly third of the country in the south-east and the elaborate extensive drainage systems covering the remaining flat land provided considerable obstacles to ground movement. However, obstacles which were not to prove impenetrable.

Thus it was natural for Belgium to seek neutrality and remain aloof from the quarrels of her larger, more powerful neighbours. But at the same time she needed to extract guarantees of security from certain of the powers, i.e. Britain and France, and convince the nation that an army was needed. These three factors remained in conflict throughout the first one hundred years of Belgium's existence and it was their interaction which left the kingdom militarily unprepared to deal with invasion, twice in quick succession.

The Belgian army was needed, when international crises arose, for deployment along the nation's frontiers in fortresses and static defences facing three ways: east towards Germany, south towards France and even north towards the Netherlands. The problem was to maintain it at its authorised strength. In 1868 a recruiting law gave greater legal force to the annual drafting of conscripts, but the army remained understrength. In 1870, at the outbreak of the Franco-Prussian War, the Belgian army mobilised and a year later demobilised; an exercise that exposed serious military and administrative shortcomings. Yet, by the turn of the century, the modest target of a 20,000 strong army had still not been reached; but in 1909, the 'drawing of lots' was dropped as a basis of selection.

Troubles there may have been over maintaining the peacetime strength of the army, but early and significant advances were made in officer training. In 1834 the *École Royale Militaire* was founded in Brussels to train young officers, and close by the *École d'Application* was set up to complete the training of those officers destined for the technical arms and staff employment of that early period. In 1868, the Belgian *École de Guerre* began staff training and, with the other two schools, remains in Brussels to this day. All armies provide similar basic and staff training for their officers but a notable feature of the Belgian army's system, since very soon after its birth, has been the purposeful specialised training of officers for a career in what may be generally described as 'Military Administration'. Since those early days, suitably qualified officers, gaining experience all the time at various levels and in various appointments within the army, have managed service finances and dealt with personnel policies like 'conditions of service'. In contrast, in most other comparable armies the policy for such matters is in the hands of civil servants who seldom have any real service experience‡.

There could be no doubting the tremendous task that faced the Belgian government immediately prior to World War I. It needed a larger army, its 33,000 men providing only six small divisions, an under-equipped cavalry division and fortress troops. Signs grew clearer and more ominous that neutralist policies would fail and that the country would once more become the battlefield of the powers: this time Britain and France against Germany. But the war came too fast and caught the Belgian army in the midst of a major reorganisation. It played very little part in the first part of the war for King Albert decided that it should have no hand in the disastrous early campaigns until there was a chance of military success. The time

* Foot, M.R.D., *Men in Uniform*, Weidenfeld and Nicolson, London, 87 (1961).

† Rather more than half of today's population of nearly 10 million live in the larger, generally more rural, northern part of the country, Flanders, and speak Flemish as their main language. The remainder live in the Walloon provinces in the south and are predominantly French speaking, as are the majority of *Bruxellois*.

‡ This notable feature of the Belgian army has led not only to smaller and generally more efficient headquarters staff, but also to a noticeable lack of administrative complications and 'burdens' even today. Both aspects are envied by those of other armies who are aware of their existence and value but do not enjoy their benefits.

World Armies

was used to overhaul the army and train its soldiers. This paid off for, in 1915, it acquitted itself well when, from positions in the northern part of the line, it drove back the Germans as they launched their final offensive in Flanders.

After the war, in 1919, Belgium concluded a defence agreement with France and entered into a similar understanding with Britain. Belgian forces joined those of France occupying the Ruhr in 1923 until the task formally ceased with the signing of the Treaty of Locarno 2 years later. In 1923, the army comprised 12 divisions manned almost entirely by conscripts serving 13 months with the 'colours'; in 1924 eight active divisions remained with the other four placed in reserve; then, in 1926, only two active and two reserve divisions were retained. This quite drastic reduction reflected the need to save the expense of maintaining a standing army in peace-time of a size comparatively larger than before the 'war to end all wars'. This recaptured mood stressed former tendencies towards neutralism, and emphasised the reliance placed upon the guarantees Britain, France, Germany and Italy made for the security of Belgium. Furthermore, the British and French undertook to intervene militarily should German forces cross to the west bank of the Rhine at any time in the future. During the inter-war years the Belgian army's main preoccupation was with strengthening fixed fortifications on pre-1914 lines and with modernising equipment.

Hitler's regime presaged peril and gloom, and general conscription had to be reintroduced. An army of 500,000 was approved in 1935 but, unfortunately, opposition in parliament hampered serious and effective rearmament at that time. Lack of funds particularly set back the modernisation of cavalry and artillery units. However, when Hitler reoccupied the Rhineland in the following year, parliamentary sanction was given for a 13 month conscription period, also for funds needed to strengthen fortifications and for equipment and mechanisation. Six active and 12 reserve infantry divisions were raised, together with two cavalry divisions and a corps of *Chasseurs Ardennais*. In that same year, 1936, it was also decided to follow a policy of neutrality more strongly.

The well-known and tragic sequence of events which led to the outbreak of World War II requires no elaboration here. As with other armies concerned with combating Nazi military adventurism, mobilisation was 'on and off'. When the order was eventually given the Belgian army encountered difficulties which were hastily tackled. Precautionary measures like anti-aircraft defence deployment and fixed fortress reinforcement were undertaken; all frontiers again were to be made secure. When Britain and France declared war on Nazi Germany on September 1st, 1939, the King formally announced Belgium's neutrality. Yet, even after Hitler had reaffirmed that there would be no invasion, he issued his infamous Instruction No. 6 on October 9th, which contained orders for the invasion of the Low Countries and also France.

When the period of 'phoney' war seemed to be drawing to a close, final mobilisation measures were taken in January, 1940. The Belgian army's strength was by this time 600,000. For once the problem was not an understrength military force; it was widespread paralysis of industry and public services caused by so many men being drafted for service. The bulk of the army took up defensive positions facing eastwards, behind a line which stretched from Antwerp in the north, along the Albert Canal to Liège, and southwards to Arlon in the Ardennes. From the Belgian standpoint, it was understandable for the government to impose as long a delay as possible before permitting British and French to enter the country. There was still hope that Hitler would keep his undertaking to recognise Belgian neutrality. Plans did exist for the deployment of British and French forces on Belgian soil, but they were secret, at least. Approval was given in early April when all the indications left no doubt as to Hitler's intention to invade. On May 15th when the Dutch army capitulated, there was chaos and panic in Limburg, the southernmost province of the Netherlands. There had been contact five days earlier between Belgian and German forces in the area of Maastricht, but now the whole area directly to the east of the central part of the Belgian defensive line lay open to a German advance. The line of the Meuse could not be held and, with the build-up of some 30 German divisions, reinforced by typical Stuka air attacks, the defences began to crumble. After valiant efforts to keep the line intact, further withdrawals and considerable losses forced the Belgian army to surrender during the night of May 27th/28th, 1940. Set against the might of the German invaders the weak home defence forces were no match. The war in Belgium lasted only 18 days. Belgian soldiers had fought as gallantly as any others but their army was simply not organised, equipped or prepared for such an onslaught, and this was not confined to the Belgian army. The larger allies were made to suffer from being caught unawares too.

So the population were left to live with and resist hostile occupation forces; the Germans deported many thousands of Belgians during the long wait for liberation. It was a tribute to their national spirit, and must have been a boost for the nation's morale, that so soon after occupation Belgian servicemen and potential servicemen began arriving in Britain to take up arms. From the end of May, 1940 men, women and children used direct and indirect routes, some travelling via Portugal and others by way of the Belgian Congo, in order to reach Britain. A hospital and refugee centre was set up in Tenby, in south-west Wales, and this area became the temporary home for many Belgians during the war. With commendable speed and resource the 1st Battalion of Fusiliers was formed there by the end of October, 1940 and the 2nd Battalion of Fusiliers was formed there by July, 1941; by then some 1600 men had been equipped and trained. In January, 1942 a group of Belgian forces concentrated in the Clacton area of Essex and it was there and then that the *1st Brigade d'Infanterie* was formed. The famous 'Liberation Brigade', as it became known, comprised three motorised units armed with heavy infantry weapons and integral means for reconnaissance. It also consisted of one armoured car squadron, one artillery battery of twelve field guns, one engineer company, a support unit and a liaison detachment. The force, like others of the nation stationed outside the homeland, proudly prepared for the day when it would help liberate the Kingdom of the Belgians.

The 'Liberation Brigade' played a successful part in the Normandy landings of August, 1944 as a component of the

British 21st Army Group. By September 3rd Belgian units had reached Tournai and when the 11th British Armoured Division entered Brussels the next day, Belgian soldiers were in the van. The capital was again free. Six days later, Maastricht in Dutch Limburg was in allied hands and Belgium had been liberated, but for a determined 'pocket' of Germans on the coast near Antwerp.

Returning to May 8th, 1942, this was the date when a Belgian independent parachute company was formed in Britain. The original complement of 144 soldiers was swelled to 210 by January, 1943 and the company became part of and trained with the British 6th Airborne Division. A year later it was transferred to the British Special Air Service (SAS) Brigade for specialised training in clandestine operations. In July, 1944 liberation was stealthily heralded when Belgian parachutists dropped in small parties into various areas of their home country.

Commandos in the Belgian forces were, and still remain, a part of the army and, from 1940, an independent unit trained in Britain. In that year it fought in Norway and, in 1942, raided Madagascar, Bruneval, St. Nazaire and Dieppe. It became part of the celebrated international No. 10 Commando. Belgian commandos also fought in the Far East, Sicily, Italy, Greece, Normandy, Waalcheren and in Germany.

Colonial troops had served in the Belgian Congo since 1877 and the *Force Publique* was 18,000 strong in 1914; between the world wars it grew in size and its training became more effective. From 1940, operations were directed by the Belgian government-in-exile and co-ordinated with British land force deployment and employment in Africa. The force grew to 40,000 troops formed into three brigades, a river unit and support. It took part in the Abyssinian campaign of 1941, and then helped establish an overland route from Lagos through Fort Lamy and part of Sudan to Cairo. In February and March, 1943 a Belgian colonial motorised brigade of 2000 troops undertook the difficult journey by land from the Congo via Juba and Khartoum to Egypt, while a further 6000 troops were shipped to the Suez Canal. This Belgian expeditionary force fought in the Middle East. To add to the story of overseas commitments, a Belgian medical unit, the 10th Casualty Clearing Station, supported operations in Burma and later in Indonesia.

After the liberation of Belgium more volunteers were recruited, and six infantry and six fusilier battalions were formed and trained, as were six pioneer (auxiliary engineer) battalions. By the close of 1944 some 16,000 men were under arms and during the next two years the total rose to 24,000 formed into three divisions. Two of these divisions with supporting units remain as part of 1st Belgian Corps, integrated within NATO's Northern Army Group.

When the Russian menace arose in central Europe, so soon after World War II, to compound the lingering threat of possible German *revanchisme*, Belgium, like her neighbour Holland, preferred to join and support defensive pacts rather than return to introspective policies of neutralism. The Belgian government joined those of neighbouring countries as early as March, 1948 to formulate terms for a mutual assistance and security agreement. The Brussels treaty was signed by Belgium, Britain, France, Luxembourg and the Netherlands later that month. By September a Western Union Defence Organisation had been established with Field Marshal Montgomery as Chairman of the Commanders-in-Chief Committee, the French General de Lattre de Tassigny as Commander-in-Chief Land Forces, and with its headquarters at Fontainebleau in France. A year later Belgium was a signatory of the North Atlantic Treaty, and to NATO, like the European organisation it superseded, she contributed forces; this contribution confirmed the sharp reversal of former Belgian policies and tendencies. Ever since that time her defence policies have reflected an interdependent approach to her own and western Europe's security and the political acceptance of retaining only a small, though not insignificant, navy and air force while directing her major military effort towards maintaining her army. *La Force Terrestre* consists of an army corps assigned to NATO (*la Force d'Intervention*), land forces designated for home defence (*les Forces de l'Interieur*) and a tactical reserve of a parachute commando (*a corps d'élite*).

Throughout its short history the Belgian army had remained a conscripted force, raised on a selective basis, with a small regular cadre of officers and NCOs. The post-war requirement to make a permanent peacetime contribution to the alliance made a change necessary. A mixed service system, part volunteer and part conscript, was introduced with a gradual strengthening of the regular element over the years. In the past the army had been caught unprepared for action and tied down too much to static fortress-like defence. Ever since the incorporation of the largest part of the Belgian land forces within an allied command, it has been accepted policy to maintain an up-to-date, strong, combat-ready and mobile contribution.

The long-term intention, as expressed in the late 1950s, was 'to assemble forces composed of one-third long-service regulars (people who intended to give the best part of their lives to armed service), one-third short-term conscripts called *militiamen* (*militiens*) and one-third short-service regulars known as 'NATO technicians' (*techniciens* — OTAN)*. Because the 'technician' scheme started well and swelled the ranks of the regular cadre, the government was able to reduce conscription in 1959 from 15 to 12 months. By the late 1960s the army's strength was almost half regular.

Other changes were introduced during the 1950s. British-pattern organisations and procedures were gradually replaced. A Service Corps, an Ordnance Corps and a Corps of Electrical and Mechanical Engineers, existed as a legacy of wartime service and training in Britain. Quartermaster, Transportation and Ordnance Corps were introduced in the 1950s on similar lines as in the American army, and later the supply, transportation and maintenance (repair) functions were combined within a single Logistic Corps. The common NATO staff organisation was introduced into all Belgian army field headquarters.

* Foot, M.R.D., *op.cit.*, pp.88,90. The Dutch introduced a very similar 'technician' scheme in order to produce 'key' specialists like tank crew, mechanics, electricians, etc. who require long training and particular expertise.

World Armies

The way the Belgians and Dutch structured their fighting formations ran parallel and reflected the process which both armies went through, in the 1950s in particular, of following American organisational patterns as well as purchasing more American combat equipment. They adopted the 'pentomic' organisation for their infantry divisions whereby each was composed of five 'battle groups'. Conventional brigades were eliminated and each new battle group, an enlarged infantry battalion with tank and artillery support, was to be capable of independent operations. When the Americans decided that this structure was unsuitable for Central Region operations, and changed in the early 1960s to divisions of three brigades, the Belgians and the Dutch had to consider an alternative structure for their field armies. About this time, NATO tried to introduce a 'standard' division of three brigades as the most appropriate main fighting formation for the central front and endeavoured to get nations involved to accept and introduce it. Only Belgium fully complied, but when the army discovered that it was alone in adopting the LANDCENT division* in all detail, it saw no reason to resist introducing its own modifications to structure and composition as they became necessary. During the 1960s, the division contained brigade groups and divisional troops and the view prevailed in the Belgian army, and elsewhere, that strong and moderately self-contained brigades were best to cope with the fluid operations envisaged. But as the variety and complexity of weapons, vehicles and equipment grew, so did the demand for men to man them and by the late 1960s personnel costs were beginning to inflate as well. In an effort to conserve manpower the Belgians, like the Dutch, replaced divisional headquarters by a command post from which the divisional commander and a small tactical staff were to conduct the battle involving two or more brigades. Combat support and logistic support units were withdrawn from divisions to be retained at corps level for allocation forward as necessary. The division, therefore, became a 'framework' and the brigade group with organic combat and logistic support remained the basic fighting formation. This is the situation today; structurally the Belgian field army is similar to the Dutch but the composition of formations and organisation of units differ.

Since the alliance was formed Belgian officers and soldiers have served alongside colleagues of other nationalities in NATO headquarters and a small number of multinationally manned units. The 1st Belgian Corps, *La Force d'Intervention*, co-operates and trains at formation and unit levels with other NATO nations who contribute contingents to the Northern Army Group. Until recently most of the Belgian corps has been stationed in the Federal Republic of Germany, but currently nearly half of its active units are being withdrawn to be barracked in Belgium. This is to save costs and for political and social reasons. Many Belgians do not understand why, after 30 years of peace, almost the whole of the fighting part of their army should be located in Germany. Because practically all of their active formations are assigned to NATO, most regular officers and soldiers have spent the majority of their service in Germany where they may have married local girls, where their families have lived for many years, and where their children have been educated. Tours of duty in Germany are popular with the army and their families and the Belgian Corps is as proud to be part of Northern Army Group as the allied NATO command is proud to have them. The operational disadvantages and problems of keeping such a large part of the corps in Belgium, so far from its battle areas, will be examined later.

It would be difficult for Belgians to overlook NATO. Its headquarters is on the outskirts of Brussels, and SHAPE is only some 30 km away near Mons. National defence policy strongly emphasises continuing support for NATO and the Euro group, and the Prime Minister, Mr Tindemans**, leads a strong body of opinion within and outside his country which favours closer European union, including common defence policies and joint equipment procurement. Like the Dutch, Belgians regard 'rationalisation' and 'specialisation' of tasks among NATO forces as a means of helping smaller nations, like their own, to continue to make worthwhile military contributions. Already, through internal rationalisation, a unified Medical Service supports the three Belgian armed services; clearly those who run the country's defence will seek and support further measures on a multinational scale. In 1975, Belgium spent less on defence per head of the population than Germany and the Netherlands, but approximately the same as Britain†.

STRENGTH AND BUDGET‡

Population: 9,930,000
Army: 63,400 (22,600 conscripts)
Navy: 4300; four major vessels, 35 smaller
Air force: 19,400; 148 combat aircraft
GNP (1977 estimate): \$73,400,000,000
Defence expenditure (1977): \$1,820,000,000

* HQ LANDCENT was at that time the superior land force headquarters for the Central Region; it was part of the Allied Forces Central Europe (AFCENT) at Fontainebleau.

** The Tindemans Report on the Future of the European Community.

† The comparison is made between NATO countries contributing forces to Northern Army Group, remembering that Germany in particular makes substantial contributions to Central Army Group and NATO's Baltic Approaches Command. The figures for 1975 (dollars per head of population) were: Germany 260; the Netherlands 215; Belgium 185; and Britain 184.

‡ *The Military Balance*, 1978-9. I.I.S.S., p.19. Figures do not show the 3000-strong separate Medical Service; they are included within those for the army.

COMMAND AND CONSTITUTIONAL STATUS

Command

The King is Commander-in-Chief. The government controls the Belgian armed forces through a Minister of Defence and a small Defence Ministry which incorporates a General or Joint Staff and a Central Administrative Staff both headed by lieutenant-generals. From a separate location, also in Brussels, the Army Headquarters headed by the Chief of Army Staff (also a lieutenant-general) controls subordinate formations (*see* Figure 1).

Constitutional Status

In principle, universal service has always been a feature of Belgian life. Every male Belgian citizen must carry out military service according to the law and the obligation lasts for 15 years unless mobilisation prolongs the period of liability indefinitely. In practice, the law provides for numerous exemptions and deferments for men considered indispensable, or who are excused or barred for various reasons*.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role and Commitment

Since the end of her colonial responsibilities in 1960 Belgium's standing forces have been totally geared to continental defence roles and commitments. The army has three main tasks: to provide an army corps of two divisions and supporting troops for the Northern Army Group; to defend the homeland; and to furnish logistic and all other forms of support for NATO contingents and home defence forces from the army base in Belgium (*see* Figure 1). In addition, the army's tactical reserve of a composite parachute-commando regiment, manned by volunteers, is capable of intervention on the central front or the flanks of NATO. A battalion of this regiment is assigned to the Allied Command Europe Mobile Force (AMF). But Belgium's role in support of the alliance is not limited to providing tactical formations and units complete with their organic support; she offers to other member nations vital logistic facilities such as ports like Antwerp, depots, staging areas and lines of communication eastwards into the operational areas of NATO's Central Region. Belgium may no longer provide the potential battlefield in any future conflict of conventional forces in Europe, but much of the country will certainly become a congested and vulnerable logistic base in the event of an emergency arising.

Deployment

Until recently only one of the four active brigades in the 1st Belgian Corps was located in Belgium in peacetime; now this has been increased to two brigades, a divisional headquarters and some supporting units so that approximately half the corps has been moved back from Germany. The consequent lengthening of deployment times from peacetime locations to operational areas causes a reduction of combat readiness and particular problems if a surprise emergency arises. The plans for the 1st Belgian Corps to be wholly manned by regular officers, NCOs and soldiers will promote combat readiness because of the higher standards of training and military proficiency generated among longer serving personnel. Formations and units take part in exercises which acquaint all ranks with their operational areas and tasks, and deployment on exercise reduces the time taken to reach these areas during an emergency, for forces in being. Reserve formations and units still have to be mobilised as well as deployed, and their availability could depend to a crucial extent on timely political decisions†.

Recent Operations

Except for military operations in the Belgian Congo (including the intervention in Stanleyville in 1964) and Rwanda-Burundi (which finished in 1961), the Belgian army has had no active service experience since World War II. Currently training teams are employed in the Congo, Rwanda and Burundi.

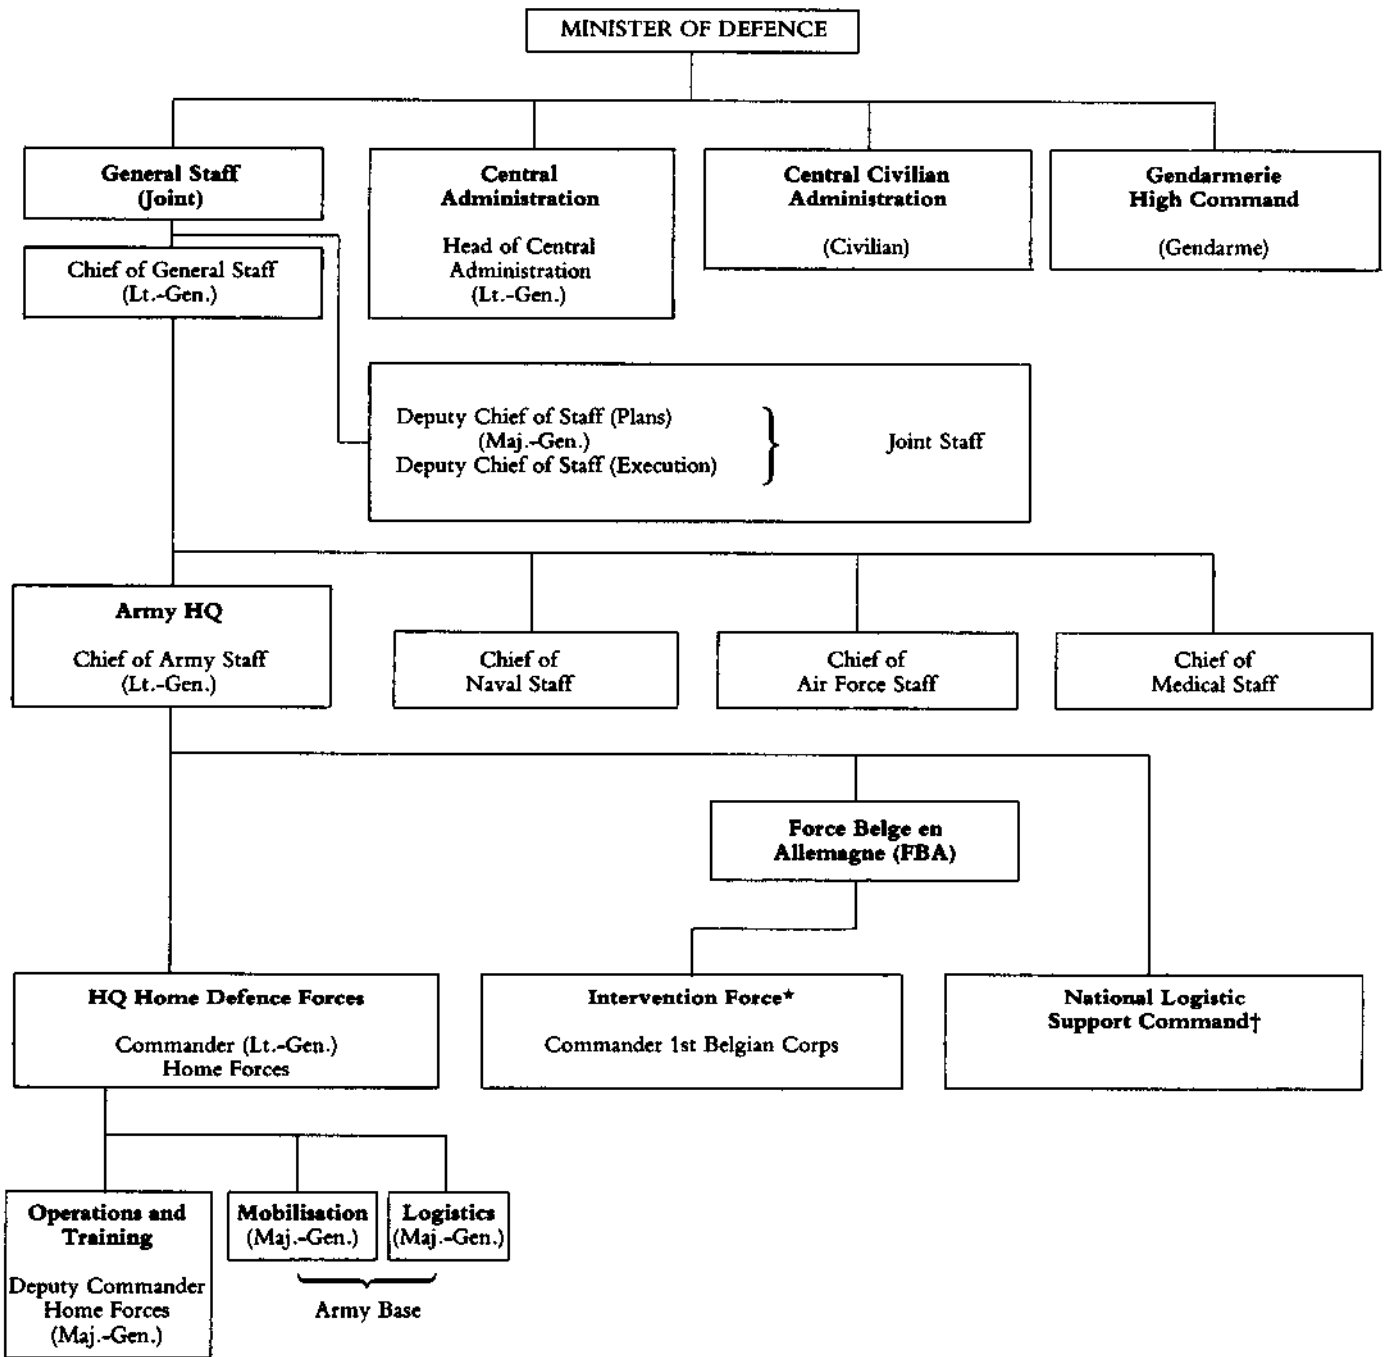

In a lightning operation over the period May 19th-22nd, 1978, 1750 Para-commandos landed in Shaba province of Zaïre to protect the survivors of anti-European massacres.

* 'Tout citoyen belge doit accomplir le service militaire': Conscription of Law, September 2nd, 1957, Chapter II, Article 2, paragraph 1 quoted in Foot, M.R.D., *op. cit.*, pp.88 and 89, which also gives details of the law, its application and exempted/defined categories.

† This is the case for all nations contributing contingents to a NATO formation.

World Armies

Figure 1 MINISTRY OF DEFENCE AND TOP LEVELS OF ARMY COMMAND

*Some units are already stationed in Belgium and therefore not technically FBA.

†Very small *État Major Terrestre FBA* based in Cologne with Corps HQ.

ORGANISATION

Arms of Service

The army comprises:

1. Cavalry (*Chasseurs à Cheval, Guides et Lanciers* manning tank and reconnaissance battalions).
2. Infantry (*Grenadiers, Carabiniers, Chasseurs Ardennais, Linie* and the *Parachute-commando Régiment*).
3. Artillery and Engineers (*Artillerie et Genie*).
4. Aviation.
5. Logistic, Signals and Medical Corps (*Troupes de Logis, Transmissions et Santé*).
6. Military Police.
7. General Staff and Military Administrators (see Table 2).

Operational

The recently completed reorganisation of Army headquarters, which is still under trial, is based on a version of the American 'Planning, Programming and Budgeting System', and is staffed throughout at officer level by the military. Land forces stationed in Germany are collectively identified by the title *Force Belge en Allemagne* (FBA); units stationed at home in Belgium are subordinated to Headquarters, Home Defence Forces. The home 'Operations and Training Organisation' comprises: subordinate military headquarters commanding home defence units which co-ordinate measures with para-military (gendarmerie) and civilian authorities on a provincial basis; the large parachute-commando regiment held in tactical reserve; and various training establishments. The functions of the 'Mobilisation' and 'Logistics' organisations are self-explanatory and provide army base support for Intervention and Home Defence Forces (see Figure 1).

Table 1 THE 1ST BELGIAN CORPS

HEADQUARTERS					
Commander (Lt.-Gen.) Chief of Staff (Col.)					
Corps Combat Troops	Active Division HQ	Active Division HQ	Reserve Division HQ	Corps Logistic Troops	Corps Signals and Provost
Reconnaissance Battalions	Three Mechanised Brigades		One Mechanised Brigade	Logistic Regiments*	Signal Battalions and Companies
Artillery Group (Maj.-Gen.) with Battalions and Heavy Batteries	One Armoured Brigade		One Motorised Brigade	Transport Regiments* Medical Regiments*	Military Police Companies
Engineer Battalions					
Aviation Squadrons					
	Mechanised Brigade	Armoured Brigade	Reserve Brigades		
	2 × Mechanised Infantry Buses 1 × Tank Bn. (40 Leopards) 1 × Artillery Bn. (18 SP guns) 1 × Anti-Tank Bn. (12 Jägdpanzerkanone, 12 Milan)† 1 × Engineer Co. 1 × Supply Co. 1 × Maintenance Co. 1 × Postal Detachment	As for Mechanised Brigade but for one additional Tank Bn.	Differences from 'active' versions: 1. Mechanised Bde. has a Recce. sqn. in place of one Infantry Bn. 2. Motorised Bde. only has one Infantry Bn. and one Tank Sqn. 3. Both have organic support.		

*Regiments commanded by colonels consist of a number of battalions. The logistic regiments undertake supply, including integral transport and maintenance (repair).

†Being introduced. The Jägdpanzerkanone is a 'tank destroyer', a high-velocity gun mounted on a tank chassis, but not in a turret.

World Armies

The FBA includes the Belgian Corps and a small national logistic support command staff (of about 13 officers in peacetime). The corps structure has been described in outline earlier: strong and moderately self-sufficient brigades, only small tactical command posts at divisional level, and support retained at corps for allocation forward as required (see Table 1). Three mechanised brigades and an armoured brigade are 'active', one further mechanised brigade and a motorised brigade are 'reserve' formations. Some combat support units are 'reserve' and a larger proportion of logistic units fall into this category. The corps is completely mechanised: all infantry is APC-mounted and artillery self-propelled.

RECRUITMENT, TRAINING AND RESERVES

Recruitment

Plans are currently being implemented to produce an all-regular Intervention Force by 1978 when it is anticipated that the volunteer element of the army will have grown from the present 55% to a projected 75%. Since the announcement of the new plans, recruitment has been most encouraging but there are misgivings in some circles that this is large attributable to a higher than normal amount of civilian unemployment. The plan also involves manning home defence units, apart from small regular cadres, with non-regulars. By 1978, the intention is to reduce national service to 6 months; at present, conscripts serve for 9 months in units in Germany and 11 months if serving in Belgium. Thus, conscription will be retained with the 'active' period reduced to what will virtually become a training course. Roughly the same number of young men will be called up for national service as now; probably one in four eligible males will be enlisted.

There is a feeling among Belgians that a predominantly conscript army integrates more easily with the populace, because a conscript is merely a citizen doing his national service. Some mistrust the idea of building an army with such a high proportion of regulars. Such an army could grow apart from the nation, could be used as an extension of political power, and could be used against 'strikes'. On the other hand, those who wish to see military proficiency continuing to improve welcome the manning of three-quarters of the army, and especially the Belgian Corps, with soldiers serving on a volunteer basis. To achieve this aim will require consistently good recruiting and there are doubts that the present strength of the Corps will be maintained because of future manpower shortages. The present success with recruiting may be sustained by the recent moving back of more corps units to Belgium from Germany because it is easier to recruit when units are based at home. The current situation is encouraging for Belgium and for NATO, and has even temporarily retarded the planned intake of women into the regular forces.

Training

Individual basic training of soldiers takes 2–3 months, depending on arm and function, followed by continuation training in units or on courses at schools. The higher proportion of regulars, and this is growing in the Belgian army, the lower the initial training overheads and, naturally, the higher the standards achieved during their longer term of service. Potential regular officers undergo two alternative categories of training: an 'all weapons' course of 4 years or a 'polytechnic' course for 5 years. Later in their careers, when they attend the *École de Guerre**, there are again two possibilities: the Staff Course or the Administration and Finance Course. Those wishing to become officers must first pass an examination in their second language (Flemish or French as the case may be) before commissioning; then officers must pass another similar examination in order to qualify for promotion to major. The schism over language means that candidates for promotion to higher rank must fit into a 50–50 allocation scheme to ensure linguistic balance. The army order of battle contains Flemish- and French-speaking brigades and units, and at divisional level and upwards all orders are published in both languages. Documents for general circulation like training pamphlets and teaching précis are also produced in both languages.

Reserves

There are specified training requirements for reservist officers, NCOs and private soldiers, and the government may recall any number of men to the 'colours' if an emergency arises. Former conscripts attend training camps regularly for the first five years after national service, some filling appointments in the two 'reserve' brigades (see Table 1). From 1978 when conscription is reduced to six months, it is probable that only one in 16 will be recalled for periodical training in units of these two brigades.

EQUIPMENT AND ARMS INDUSTRY

Since World War II the Belgian armaments industry has become prominent mainly through its success and skill in producing small arms. *Fabrique Nationale* (FN) is a familiar trade name in the many armies equipped with the Belgian

* Selection is as stiff as in other comparable armies. Those wishing to qualify must first pass examinations in both English and German; this is additional to their bi-lingual requirements in Flemish and French.

self-loading rifle (SLR). Today the country's industry manufacturers or assembles, or both, equipment developed elsewhere, e.g., the German Leopard tank and the British Combat Vehicle Reconnaissance Tracked (CVRT) made under licence for the army.

Equipment in service includes: Leopard main battle tank (MBT); AMX 13 (French) and M-75 (American) APCs; M-41 (Walker Bulldog) light tanks; Honest John free flight rocket; 8in self-propelled howitzer (M-110); 155 mm self-propelled howitzer (M-109); 105 mm self-propelled howitzer (M-108); 20 mm Light anti-aircraft gun; Hawk surface-to-air missile; 4.2in, 81 mm and 60 mm mortars; ENTAC anti-tank guided missile (APC and jeep mounted); 7 mm Vigneron M-2 machine pistol; 9 mm Browning pistol; 7.62 mm FN general purpose machine-gun (GPMG) and light machine-gun (LMG); 7.62 mm FN SLR.

Equipment being introduced at present includes:

CVRT replacing the M-41 light tanks; Jägdpanzerkanone (JPK) tank destroyer; Épervier weapon system.

Re-equipment planned for 1976-1980 includes:

Milan to replace ENTAC; Gepard (Leopard chassis mounting 35 mm Oerlikons) to replace the 20 mm gun; Lance replacing Honest John; Long Range Surveillance drone; replacement APCs, jeeps, trucks and helicopters (for both liaison and anti-armour purposes).

RANK, DRESS AND DISTINCTIONS

A similarity with British army uniform remains: ceremonial dress for officers is blue 'patrols' with regimental accoutrements; service dress, battle dress, berets and 1937-pattern webbing are worn; officers continue to use 'British warm' overcoats. Service dress is made from a khaki heavy- or light (summer)-weight material and the useful battle-dress keeps its long-service style. Arm or regimental badges are worn on khaki peak caps. Generals wear crimson hat bands and 'winged thunderbolts' above their rank badges in gold embroidery on collar patches. All ranks wear collar patches, the colour of which denotes arm or regiment, and some have regimental badges as well (see Table 2). Combat dress, in denim material, is drab green in colour.

Brigadier's rank does not exist in the Belgian army*, but an extra rank is inserted between captain and major, that of captain-commandant. In a battalion a commandant (abbreviated rank title) normally commands a company, squadron or battery. Officers and adjutants (senior warrant officers) wear embroidered badges of rank on coloured collar patches, and NCOs' rank insignia are sewn onto the lower sleeve (see Table 2).

<i>On collar patches</i>	<i>Gold stars</i>	<i>Gold bars below stars</i>	<i>Silver star</i>

Adjutant-chief (RSM)	One silver star above a palm bar
First sergeant-major	Three silver bars (space) two silver bars
First sergeant	Two silver bars (space) two silver bars
Sergeant	One silver bar (space) two silver bars
Corporal-chef	One silver bar, one red bar, one silver bar
Corporal	Two silver bars

CURRENT DEVELOPMENTS

The strength of the Belgian army has been reducing and now totals about 63,000 men, including some 22,000 conscripts. Significant progress was being made with regular recruiting with the aim of making the 1st Belgian Corps a totally volunteer force by 1978. Thereafter it is planned to reduce national service to six months and man all home defence and army base units with non-regulars, except for small cadres. A similar proportion of 'active' and 'reserve' units to that which

* Colonels command brigades and a colonel acts as Chief of Staff, 1st Belgian Corps.

exists at present will be maintained in the 1st Belgian Corps, but more units are being housed in Belgium than before. The army retains its high standards of military discipline and proficiency and has not had the same problems with conscripts experienced in the Dutch army. Officers and soldiers may join any union although there are independent army trade unions. Currently one of the NCO unions appears to be quite strongly connected with the ruling Liberal party; in Belgium, unions are not automatically left-wing or socialist-affiliated as in the Netherlands and some other countries.

Defence expenditure stands at 3.1% of the gross national product* and it is planned to increase spending by 4% each year at constant prices. The 'conversion' costs to create an army three-quarters regular is supplementary to this annual increase. Equipment and other capital investment take up 25% of the military budget, personnel costs now exceed 50% and operating costs have dropped below 25%. Belgium strongly supports NATO and Eurogroup, and particularly efforts to standardise equipment and to economise on development, production and procurement costs. Mr Paul Vanden Boeynants, the Belgian Minister of National Defence, said recently, 'The aim of Belgium is to strengthen collective security by abiding by its Atlantic commitments and constantly developing inter-European co-operation.'

JOHN SKINNER

* NATO Facts and Figures, (1976). Brussels, Jan., 116. Compares NATO countries' defence spending in terms other than a percentage of GNP.

BELIZE

Belize is the only country of the English-speaking Caribbean in which armed forces are primarily for external defence rather than internal security. Although the Belize Defence Force was only officially created at the beginning of 1978, and the bulk of the responsibility for defending the country still rests on the British troops stationed there, it seems likely that Belize's armed forces will eventually grow to a relatively larger size than those of other members of the Caribbean Community (CARICOM), which it joined in 1974.

The reason for this also accounts for the fact that Belize (formerly British Honduras, renamed in 1973) has still not achieved full formal independence from Britain: its entire territory is claimed by neighbouring Guatemala. Belize has had full internal self-government since 1964, and has long been as desirous of independence as Britain is eager to grant it. The problem is that Belizeans are convinced that only the small British defence forces stationed there (and the prospect of their rapid reinforcement in an emergency) deter the Guatemalan army from marching in. Belize will not accept full independence without a continuing defence guarantee, and Britain is not willing to extend such a guarantee after independence.

Belize was first settled by British wood-cutters in 1638, and has been in continuous British possession ever since. Britain's presence there was never formally recognised by Spain, however, and when the Central American States became independent in 1821, Guatemala inherited and pursued the Spanish claim to Belize. Finally, in 1859, the present frontier was agreed by a convention between Britain and Guatemala, in return for which Britain undertook to construct a road from Guatemala's land-locked Petén region through Belize to the Caribbean coast. This road was never built, however, and in 1940 Guatemala repudiated the convention and revived its claim. There is also a dormant Mexican claim to the northern part of the country, which Mexico has stated it would waive if Belize became independent, but would revive if Guatemala attempted to annex the British colony.

Since 1945 all Guatemalan constitutions have insisted that the entire territory of Belize is part of Guatemala, and all its inhabitants Guatemalan citizens. There have been regularly repeated Guatemalan threats to invade the country, necessitating the permanent stationing of a British garrison there. The claim has now been made into a major element in Guatemalan nationalism, and is frequently used by a harrassed government to distract attention from difficulties at home, or by the extreme right wing to bring pressure against a government it feels is becoming too conciliatory.

There is also an apparently genuine fear in Guatemalan military circles that an independent Belize could become a base for leftist guerrilla operations against the existing regime. Indeed, the Guatemalan army insisted that arms and supplies were coming in via Belize during the rural guerrilla campaigns of the 1960s, although all outside observers were convinced that the guerrilla supply lines ran through the wild and unpopulated areas along the northern border with Mexico. This fear has not been lessened by Cuba's vocal support for Belizean independence, including the unsolicited offer of military aid in the country's defence.

These various factors within Guatemala have led to repeated outbursts of sabre-rattling accompanied by threatening military concentrations along the Belizean frontier. Combined with the steady growth in size and combat effectiveness of the Guatemalan armed forces, they have caused a considerable rise in the size of the British garrison in Belize over the past decade. The pattern has been one of urgent reinforcement in a crisis, followed by subsequent reduction — in 1972 the aircraft carrier *Ark Royal* and several thousand British troops were dispatched to the area; in 1975 an extra battalion of troops and a squadron of Harriers were flown in on short notice; and in July, 1977 the same reinforcements were sent again — but the permanent British garrison in non-crisis periods has risen from around 750 men in 1970 to over 1500 in mid-1978.

The Belizean population these troops are defending numbers only 175,000, in a largely empty territory of about 8000 square miles. It is an extraordinarily mixed population. Although the principal groups are of Caribbean/African and Spanish/Indian descent, in about equal numbers, it includes Asians and white Spanish-speakers, mestizo and Indian refugees from various uprisings in Mexico in the north, blacks with Irish names, pure Mayan Indians and Chinese (including the descendants of an entire Chinese village that emigrated *en masse* during the Boxer Rebellion), and such curiosities as the Black Caribs (Carib Indians deported from the Windward Islands mingled with Africans) and 3000 Mennonites who moved down from Mexico in 1958. The Prime Minister is part Welsh, part Mayan Indian.

Approximately two-thirds of the population are English speaking, one-third primarily Spanish speaking (although an 'open-door' immigration policy, creating a steady inflow from the overcrowded islands of the West Indies, is tending to reinforce the English-speaking element). Virtually all identify themselves as Belizeans, and have no wish to be connected to Guatemala in any way. The independence movement which emerged in 1949, under the title of the People's United Party, has dominated Belizean politics ever since, and its leader, George Price, has been Prime Minister since full internal self-government was granted in 1964. The small opposition party opposes independence, but principally out of fear of Guatemala.

The Belizean government, while unwilling to accept independence without a reliable external defence guarantee, has conducted a long and increasingly successful campaign to muster international support on behalf of its right to self-

World Armies

determination. It has succeeded in persuading not only the Commonwealth conferences but also the General Assembly of the United Nations to adopt resolutions supporting its independence by overwhelming majorities each year since 1975. The English-speaking nations of the Caribbean naturally support it unanimously. More importantly, perhaps, it has recently succeeded in attracting support for its rejection of Guatemalan claims from Latin American nations, including most of those which are nearby: Mexico, Colombia, Venezuela, Panamá and Costa Rica. (Guatemala broke off diplomatic relations with Panamá in 1977 over this decision.) Honduras is also favourably disposed to Belizean independence, and the only remaining opponents within Central America are Guatemala's fellow right-wing governments in El Salvador (which has promised Guatemala military aid in case of a war over Belize) and Nicaragua.

It was as part of this drive to assure diplomatic and military support for its independence that Belize created its own armed forces, by a law which went into effect on January 1st, 1978. (The actual constitution of the force began early in the previous year.) The nucleus of the Belize Defence Force is the former Special Force of the Belize Police, which was transferred whole to the new organisation, while the bulk of the early recruits were drawn from the Belize Volunteer Guard, a home guard force which had previously acted as a police reserve.

The intention is to proceed initially with the creation by the end of 1980 of a military force of about infantry battalion strength, including special signals, transport and ordnance elements. Recruitment is voluntary, and the terms of service are not known. The former Belize Volunteer Guard now serves as a reserve organisation for the Defence Force. Ranks, uniforms, equipment and organisation follow British models, and most training is provided by regular British units stationed in Belize. It is not known whether a further expansion of the Belize Defence Force is contemplated for the period after 1980, but it is likely that the reserve organisation at least will undergo considerable further growth.

The Commander of the Belize Defence Force is Lieutenant-Colonel Sabido (former Commander of the Belize Volunteer Guard), but overall control of the defence of Belize until formal independence will continue to rest with the Governor and Commander-in-Chief, currently Peter Donovan McEntee OBE, and with the Commander British Forces Belize (in 1978, Colonel John Head). British forces stationed in the country include a minimum of one infantry battalion (rotated at regular intervals), an armoured reconnaissance troop, an artillery battery, a troop of sappers, an Army Air Corps detachment and a squadron of the RAF Regiment for airfield defence. There is always at least one Royal Navy frigate on call with Marines embarked, and in times of high tension the defence forces have been reinforced within 2-3 days by an additional infantry battalion, another frigate and a squadron of Harrier VTOL fighter-bombers.

Although some potential for infiltration exists in the Maya Mountains along the southern part of the Belize-Guatemala border, the principal route of any possible invasion would be along the single road connecting the two countries and leading eastward to the new inland capital, Belmopan, and to Belize City on the coast, the principal town. There are Guatemalan commando bases at Melchor de Mencos near this border-crossing point, and a substantial proportion of the British troops in Belize is stationed at Holdfast Camp near San Ignacio on the other side of the frontier. An attack along this line could be greatly slowed, however, by blowing the single suspension bridge which crosses the Belize River near San Ignacio. Another exposed area is near Punta Gorda in the extreme south (where off-shore oil exploration is underway), as the bulk of the Guatemalan navy is now stationed at the country's sole Caribbean port — Puerto Barrios, only 30 miles away.

The only key strategic point, however, and the one on which the British and Belizean defence effort is concentrated above all, is Belize airport, where the 2100 yd runway is the only one in the country able to take jet transport aircraft and so to guarantee a rapid flow of reinforcements. Airport Camp is also the headquarters of British forces in Belize, and following Guatemala's recent acquisition of 12 Arava transport aircraft from Israel there was concern that a rapid airborne assault could seize the airport and effectively isolate the country from reinforcements. It is now heavily defended by Bofors guns and Tiger Cat surface-to-air missiles, however, so this does not seem a serious danger.

Britain has engaged in continual negotiations with Guatemala over the past few years in an attempt to find some solution that would permit it to grant Belize independence without the need to give it an open-ended defence guarantee, and in late 1977 to early 1978 London actually discussed the cession of a substantial proportion of Belize's territory to Guatemala in return for a recognised and secure independence for the remainder. This approach had strong United States support, and reportedly included the further inducement of British and United States finance for a \$100,000,000 oil refinery in Guatemala. The negotiators began by discussing the transfer of 2000 square miles of southern Belize to Guatemala (one quarter of the country's area, and the region which contains the suspected oil reserves and mineral deposits that are Belize's main hope of future prosperity). It is not clear whether Britain ever had the Belize government's approval for this idea; it is known that the offer was dropped first to 1500 square miles, and then to 1000, in an attempt to secure Belize's agreement, before Prime Minister Price made the entire affair public and stated that his country was determined to insist on its full territorial integrity.

Nevertheless, this demonstration of British eagerness to be rid of its embarrassing commitment in Belize and to make territorial concessions (as the sovereign power) to hasten the day of its withdrawal (although, it was stated, such concessions would require the consent of the Belize government and people) has understandably alarmed the Belize government while hardening Guatemalan determination to press their claim. It has led Belize to hold active consultations with the governments of Guyana, Trinidad and Jamaica on the possibility of a joint military guarantee of Belizean independence by the CARICOM countries, though their tiny armed forces would make such a guarantee ineffective unless the troops of larger Caribbean powers like Venezuela or Mexico were also on call. Pending the creation of some such

arrangement, Belize will probably have to continue to rely on the British garrison and its own growing Defence Force, while foregoing the luxury of formal independence.

GWYNNE DYER

BENIN (formerly Dahomey)*

HISTORY AND INTRODUCTION

This country is one of the poorest in Africa. Its intractable and apparently insoluble economic difficulties have been the main cause of its internal instability since the attainment of independence from France in 1960. The country has presented a depressing picture of confusion, coups, strikes, plots and abortive coups, scandals and ethnic rivalries. A major contributory cause of this sequence has also been the existence of a large and ambitious *élite* clan, political and military, which has exploited regional and other differences.

In 1960 Prime Minister Maga (President from 1961) was in power; his government lasted until riots and strikes in October, 1963 when the army, under Colonel Soglo, took power. The army made way for a government headed by two of Maga's rivals: Apithy (President) and Ahomadegbe (Prime Minister) in 1964. In 1965 the army, again under Soglo, returned to power in circumstances of disorder; initially it attempted to rule through a civilian, Congacou, but later in the year Soglo took over himself. At the end of 1967 Soglo was removed by a group of younger officers who, along ethnic and political lines, were themselves sharply divided. These attempted to rule through a Military Revolutionary Committee; finding this impossible they handed authority to the Army Commander, Colonel Alley. Alley disliked military involvement in government and returned power to a civilian regime in 1968, again amidst conditions of confusion and recrimination.

This regime found itself heavily dependent on Colonel Kouandete, Alley's principal rival in the army, which led Alley to attempt a coup; this failed and Alley was arrested. Kouandete then assumed power in 1969 and permitted both the return to the country, and to political life, of Maga, Apithy and Ahomadegbe, in a triumvirate. This in turn led to increasing unrest, disunity, disobedience and abortive coups in the army, and to yet one more successful coup, by a northern officer, Major Kerekou, in 1972. Kerekou's government has lasted longer, and has proved slightly less inefficient, than any post-independence government in Porto Novo. Its policy has been one of political disengagement from France together with increasing Marxist rhetoric, without too sharp an alienation from indispensable French economic and military aid. In January, 1975 there was an abortive coup involving one unit that attempted to overthrow Kerekou, the most serious of three such plots in the period 1972 to 1975; this was followed shortly afterwards by a political scandal in which it was alleged that the Defence Minister was caught in bed with the President's wife.

Periodic strikes and demonstrations, suppressed with some severity, suggested that Kerekou's government was not solving Benin's problems any more than its numerous predecessors. In January, 1977 a most extraordinary event took place: a group of airborne soldiers, some of pale complexion, attacked the Presidential Palace in a seemingly very casual style. The attack was unsuccessful. Benin rhetoric alleged that Togo, Gabon and Morocco organised the raid, with French financial and logistic help. Other explanations that have been offered suggest either that the shooting arose from a feud between the army and the gendarmerie, or, somewhat less likely, that the affair was arranged by Kerekou himself to rally support and dispose of opponents. Of all these explanations, a measure of Moroccan complicity seems the least improbable, Morocco being aggrieved at Benin's support for Polisario claims in the former Spanish Sahara.

STRENGTH AND BUDGET

Population: 3,500,000 (approximately)
Armed forces: army of 2000 and a gendarmerie of 1100
GNP (1977 estimate): \$600,000,000

COMMAND AND CONSTITUTIONAL STATUS

Colonel M. Kerekou is President of Benin, President of the Military Revolutionary Council and Minister for Defence.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Benin's army is, under the Kerekou regime, supposed to be committed to the government's revolutionary and development policies.

* For general notes on African armies, see Appendix 1.

In defence terms, relations with Togo are very strained, Benin's dissidents having moved there. The border is guarded.

ORGANISATION

Benin's army is composed of two infantry battalions, a company described as para-commando, a reconnaissance squadron and an artillery battery. One report also suggests an engineer sub-unit.

The para-commando company is normally stationed at Ouidah, and one each of the infantry battalions is in the north and south of the country, respectively.

Army headquarters is at Parakou, the air force headquarters and base is at Porto Novo.

A grandiose reorganisation scheme was proclaimed late in 1976 in which all State services were to fall into three groups. The first is to comprise the army, police, customs, fire, border guards, gendarmerie and forest service; the second is to be a public security force; and the third a people's militia. North Korean assistance has been reported both in the late 1960s and at present; a very unconfirmed report notes the arrival of a small number of Cuban advisers.

RECRUITMENT, TRAINING AND RESERVES

The army is raised by a somewhat random system of 18 months' national service. While there is intense ethnic rivalry among the officers this does not appear to have extended either to soldiers or to their recruitment.

EQUIPMENT AND ARMS INDUSTRY

Benin has no arms industry. Almost all its equipment has come from France, except the few armoured cars of the reconnaissance squadron which are United States M8 vehicles. The artillery battery possesses 105 mm weapons and the infantry battalions 81 mm and 60 mm mortars. The air force consists of three assorted transport aircraft, two liaison aircraft and one helicopter.

RANK, DRESS AND DISTINCTIONS

Those generally follow the French pattern except that officers wear peaked caps and not the *képi*.

CURRENT DEVELOPMENTS

The Benin army lacks credibility. It has never succeeded in retaining popular support for its interventions in political life. Just as the triumvirate, or eternal triangle, of Maga, Apithy and Ahomadegbe represented the regional interests of the north, the south and the Fon, respectively, so in the army have the personalities of Kerekou, Kouandete, Alley and Soglo.

There have also been sharp, at times bitter, divisions between the older and more experienced officers who had risen from the ranks of France's colonial army, and the newer generation of young men trained at St-Cyr-Coëtquidan and elsewhere. Soglo and Alley represented the older generation, and Kouandete and Kerekou the younger generation. Under Kerekou the latter group appear to have gained almost complete ascendancy.

BHUTAN

The Kingdom of Bhutan, a country similar to Switzerland in size and topography, situated on the Indian–Chinese border, has existed in a state of uneasy dependency on India ever since the British East India Company concluded a treaty with the ruling family in 1774. By a subsequent treaty of 1910 the kingdom agreed to let Britain handle its foreign affairs, and this responsibility was assumed by New Delhi on Indian independence in 1947. According to the most recent treaty, renegotiated in 1949, Bhutan ‘agrees to be guided by the advice of India’ in its foreign policy.

Bhutanese officials frequently claim that this advice is not necessarily binding, but New Delhi insists that it is, and in practice Bhutan accepts this fact. Thus, for example, Bhutan does not dare to resume trade with Tibet, which was banned in 1960 when Sino–Indian hostility was fast becoming serious, nor to have diplomatic contact with its Chinese neighbour. India’s influence, based on its overwhelming military dominance in the area and its physical control over all access to Bhutan for trade or travel, is reinforced by the fact that its economic aid to the kingdom finances almost all of the country’s development plan.

Indeed, New Delhi is so conscious of the need to preserve its exclusive influence in this strategically hypersensitive area — at Bhutan’s western end only 10 miles separate China from the 50 mile-wide corridor connecting the main part of India to all its north-eastern provinces — that it has shown itself extremely jealous of the United Nations, its principal rival in the provision of aid to Bhutan. Bhutan is one of the world’s highest per capita recipients of UN aid (around \$10 per capita), but UN experts travelling to Bhutan are habitually subjected to administrative harassment while passing through India.

The Indian solicitousness for Bhutan’s welfare is particularly pronounced in matters of defence. In addition to providing a resident military mission in the capital, Thimpu, and furnishing most of the aid and training for Bhutan’s small army, India maintains an undisclosed number of its own troops in the country. Reports that as much as a division of Indian troops is based in the country are certainly exaggerated, but it is beyond question that regular Indian army units help the Bhutanese to patrol their northern border with China, and that contingency plans exist for their rapid reinforcement in a crisis. It is generally believed that the imposition of a prohibitive entry fee for foreign tourists in 1975, which strangled the infant tourist industry, was made at India’s insistence, to avoid the embarrassment of foreign visitors freely roaming about Bhutan and observing the scale of the Indian military presence. Those foreign tourists who do enter Bhutan may travel only in groups accompanied by guide/interpreters, and are restricted to the central areas.

With its external defence task effectively taken over by the Indian army, the role of the Bhutanese army is mainly internal security. In this regard, there is little by way of sophisticated political dissent, as Bhutan is one of the least-developed countries in the world: annual per capita income is under \$60, over 95% of the population are illiterate peasant farmers living in isolated valleys, and there are only four settlements with populations of over 10,000. In a population of 1,200,000, there are only 18,300 students attending school.

Political parties are illegal, and King Jigme Singye Wangchuk rules virtually as an absolute monarch, appointing his own Council of Ministers to run the government. There is a National Assembly of 150 members (100 indirectly elected village elders, 10 monastic representatives and 40 government appointees) which has the power to enact legislation, accept or reject the appointment of royal ministers, and even every 3 years to hold a vote of confidence on which the King’s continued reign is contingent, but in practice it presents no obstacle to royal rule.

The principal potential source of instability which might call for the army to exercise its internal security role is the composition of the population. Approximately 60% are Bhotias, the dominant, Tibetan-related group which speaks the national language, Dzongkha, but about 25%, living mainly in the western districts, are Gurungs, a Nepalese group. The remaining 15% are made up of an Assamese minority in the south-east and various small indigenous or migrant tribes. There is also a small but relatively well-educated community of about 5000 Tibetan refugees, politically loyal to the exiled Dalai Lama: in 1974 a group of them were arrested when the government discovered a plot to assassinate the newly crowned King, who was then 18 years old.

The principal instrument for containing the often severe inter-communal rivalries is the army, a force of about 4000 men which is directly under royal control. Military service is obligatory for all males, with liability extending from the age of 18 years to fifty, but in practice there are invariably sufficient volunteers to fill the ranks. There is in addition a militia numbering about 15,000 which serves as a local security force and reserve.

The army is trained by Indian officers, and all of its weapons — light infantry weapons only — are derived from India. Uniforms, ranks and organisational structure are also modelled on the Indian army. Annual defence expenditure is unknown, but cannot be large as the total government expenditure in 1978 was only 65,100,000 ngultrums (the ngultrum has the same value as the Indian rupee). There is almost certainly an Indian subsidy to the Bhutanese military budget as well, however.

GWYNNE DYER

BOLIVIA

HISTORY AND INTRODUCTION

Bolivia has an extremely violent history, the result both of frequent internal revolution and of bloody foreign war. A very high proportion of her rulers have been military men and, in modern times, the army has directly exercised power for long periods; at the same time, Bolivia is one of the few countries in Latin America in which the army has been defeated and humbled in the course of political conflict. It has a better reason than most Latin American armies, therefore, to appreciate the importance of armed force in internal politics.

Bolivia, originally Upper Peru, seceded from that newly independent State in 1825, but chose to call itself after the liberator who had secured the independence of both countries. An Andean State with a very large majority of depressed and illiterate Indian peasants in its population, the country and its politics were to be dominated by the white creole class throughout the nineteenth century and for much of the twentieth. The first president, Sucre, Bolivar's principal aide, was succeeded by the ambitious Santa Cruz (1829–39), who succeeded in dragooning Peru back into a confederation with his domain. The confederation was dissolved as a result of the battle of Yungay (*see Chile*). He was succeeded in turn by a succession of caudillos, almost all of whom ruled by brute force through *ad hoc* armies. The defeat of Daza's army in the War of the Pacific (*see Chile and Peru*) inflicted on the country a disastrous loss of territory and its access to the sea, recovery of which is still a major issue in Bolivian politics and diplomacy, and so discredited caudillism as a system that the country was thereafter able to enjoy several decades of reasonably constitutional government, in which the army played an intermediary role between liberal and conservative factions.

The emergence of the army as a properly organised force does not, however, antedate 1891, when a Bolivian graduate of the French *École de Guerre* was brought home to open the military academy (*Colegio Militar*), which found a home first in Sucre, then in Oruro and eventually (1899) in La Paz. Shortly afterwards, in step with developments in neighbouring countries, foreign missions were invited into the country to help with the reorganisation and retraining, first a French mission in 1905, which created a rudimentary general staff, and then, more fashionably, a German mission which arrived in 1911. Its head, Major Kundt, was appointed head of the general staff, and a subordinate director of the *Colegio Militar*. The mission went home in 1914 but Kundt returned in 1921, was named Minister of Defence in 1925, so pleased was the government by his skill in arranging military parades, but fell from favour in 1931 for meddling in politics.

The army's involvement in politics, dormant since the previous century, was reawakened by its defeat at the hands of Paraguay (*see that entry*) in the Chaco War of 1932–8. Young officers, led by Colonel Toro, impatient with the ineptitude the civilian government had shown in the management of the war, and outraged at the heavy losses (60,000 dead, mostly Indians) the army had suffered in consequence, overthrew it in 1936 and installed a colonels' regime which proclaimed a collectivist policy modelled on current European Fascist programmes. It invited an Italian military mission into the country in 1938 to establish a staff college and to reform the general staff discredited by the Chaco War, and also founded an arms school to improve the training of all officers.

The suicide of Colonel-President Busch in 1939 allowed the oligarchy to reassert its power and rule through a succession of older generals, but in 1943 the members of a military 'lodge', the *Razón de Patria*, founded while they were held prisoner by the Paraguayans, made common cause with the radical political party, the National Revolutionary Movement (MNR), took power and reintroduced the national socialist policies (the emphasis was socialist rather than nationalist) with which Toro and Busch had experimented. Their motives for doing so are easily explained. Bolivia is a poor country of enormous natural wealth, 'a beggar sitting on a golden throne', as the local proverb has it. Most of the wealth takes the form of deposits of minerals, mainly tin, and of oil, the exploitation of which, and profit from which were, to an extent even greater than was once true of Peru, in foreign hands. The young officers, led by Major/President Villaroel, and the MNR, led by Paz Estenssoro, made it their ambition to retain the bulk of these profits inside the country. In reaction the mining companies used their wealth to foment disturbances against the government, in one of which Villaroel was lynched.

The traditional ruling class regained power, purged the army and exiled the political undesirables. MNR nevertheless won the presidential elections of 1951 and, when prevented from assuming power by a right-wing military *junta*, organised an armed political militia, chiefly of miners, and overthrew it in April, 1952. The passage of events which ensued is almost unprecedented in the modern history of any State: the army was not technically disbanded, but it was largely ignored, and its place taken by the three militias of the miners, factory workers and peasants. Some purging of the officer corps took place (though early reports that 80% were dismissed have been proved untrue, the real figure being nearer 25%), and about two-thirds of the conscripts sent home. The remaining personnel did what they could to maintain barracks and equipment, while the militiamen performed most of the army's traditional duties, to the extent of refusing officers access to armouries and arsenals. The *Colegio Militar* received a class of 'MNR cadets' who were graduated after 10 months' training and told at

World Armies

their commissioning parade by the party leader, Paz Estenssoro, that the 'new army' was an instrument of production and a builder of schools and roads, as well as the defender of the nation.

Meanwhile the MNR hurried through a number of fundamental reforms, none of which, given the grossly unequal character of Bolivian society and its economic dependency on outside interests, was premature: the extension of the franchise to all adults, the breaking up of the great absentee-landlord estates, and the nationalisation of the three major tin-mining companies. Over the latter the government overreached itself. By 1961, after a collapse of the world tin market, the nationalised mines had become a major economic embarrassment to the government, which was obliged to turn to the army, now somewhat restored in strength and standing, to overawe the miners' militia so that a sensible reduction of their inflated labour force could be effected.

This reversal of MNR's policies was seen as a betrayal by many of its supporters and Paz was able to secure re-election in 1960 only by engaging the army as his ally. In order to contain what had become endemic violence in Cochabamba and Santa Cruz departments, the two were declared virtually autonomous military zones in 1960, under military *interventores*. One of these, General Barrientos, made it his price to Paz, who unprecedentedly sought re-election in 1964, that he should take him as his vice-presidential candidate. There were good political grounds for doing so, in that the general belonged to the pro-MNR faction inside the army, and had a strong following among the peasants of the eastern departments where he had been *interventor*. No sooner elected, however, than he ousted Paz, alleging that the president's policies were divisive and unpatriotic, and took power himself, with the support and endorsement of the armed forces commander, Ovando, himself an MNR general, political radical and economic nationalist. The two men nevertheless dealt firmly with the continuing disturbances in the mines, eagerly courted American support for the economy and used the skills learnt by the hundreds of officers they sent to the United States School of the Americas to put down ruthlessly Ché Guevara's attempt in 1967 to foment trouble among the peasants of the east. Barrientos was killed in a helicopter crash in 1969, and was briefly succeeded by his vice-president, but after 4 months Ovando took power and restated a full programme of left-wing aims, including the nationalisation of the Gulf Oil Company. An internal army coup, led by the rightist General Miranda, removed him from the presidency after a year but did not succeed in capturing power, which passed to another left-wing general, Torres. He promised 'a popular, nationalist government resting on four pillars — the peasant farmers, the workers, the students and the armed forces', showed open hostility to the United States, extended contacts with Russia and eastern Europe and appeared to be building a constituency among the army's NCOs. It may have been this last development which prompted the right within the army, led by the able young commander of the *Colegio Militar*, to move against him, which it did decisively after some misfired attempts in August, 1971.

The leader, Colonel Banzer, remains in power as president 7 years later. Elections to have been held in August, 1975 have been postponed several times, though they were promised for 1978. Meanwhile, the military regime has had to cope with persistently difficult economic conditions, recurrent disorders and a running disagreement over policy within the armed forces themselves. To an ever greater extent than in Peru and Chile, the Bolivian army and its leaders have found that the assumption of power does not suspend the political process, but merely transposes it from the civilian to the military plane.

STRENGTH AND BUDGET

Population: 5,910,000
Army: 17,000
Navy (river and lake): 1500; 17 small craft
Air force: 4000; 45 combat aircraft
Paramilitary: 5000 armed police
GNP (1976 estimate): \$2,500,000,000
Defence expenditure (1977): \$74,200,000

A very high proportion of the national budget (about 24%) was devoted to defence before the 1952 coup. It then declined to about 7% and rose slowly during the 1960s to about 13%. Bolivia has benefited particularly generously from United States military assistance and Agency for International Development payments, the latter used chiefly for rural development work sponsored by the army engineers.

COMMAND AND CONSTITUTIONAL STATUS

The President is Commander-in-Chief. Since 1964 the post has been held by a soldier. He exercises direct command over the army, air force, police and navy (formerly the River and Lake Force, established 1963). The commanders of the four services direct their own staffs. The former post of Commander-in-Chief of the Armed Forces, always held by an army officer, was abolished in July, 1970 as a result of an internal army faction-fight, and replaced by the Superior Council of National Defence, on which senior officers of all services sit. It is an advisory body to the presidency. The Ministry of National Defence, traditionally held by a soldier before the 1964 coup, but not always since, is administrative in function; it does not exercise command. Staffs are organised on the American system.

Though Bolivia enjoyed a period of stable, civilian government between 1880 and 1930, its political history is so full of revolution, dictatorship and constitutional upsets, that it is difficult to point to norms in the arrangements of civil–military relations in the country.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

Though the army has fought in two of South America's major wars, and is now in effective control of the government, a close American military observer* ascribes it a comparatively modest institutional role: 'It is not an operational force, and, despite sporadic employment of a few units against guerrilla groups and organised violence in the mining areas, it has never developed an operational "mystique". Emphasis has been, rather, on supporting an army presence throughout the national territory, maintaining frontier garrisons and protecting the central government apparatus'. The repossession of access to the sea is a national ambition.

Commitment

Bolivia is a signatory of the two main Latin American defence treaties, Chapultepec and Rio, and has a bi-lateral military assistance agreement with the USA, but is not committed to any other external military responsibility.

Deployment

The country is divided into nine military regions, which correspond with the administrative departments, and are further sub-divided into circumscriptions and districts, the latter chiefly for recruiting purposes. The army is organised into 10 'divisions', based one in each of the regions, but with an additional 'division' at Viacha in La Paz Department. There are headquarters at Viacha, Oruro, Villa Montes, Sucre, Camiri, Roboré, Santa Cruz, Riberalta, Trinidad, Cochabamba, Cobija, Potosí and Tarija. The main bases are at Miraflores barracks, La Paz and at Cochabamba (Seventh Division) which houses the staff college, the arms school, the NCOs school and the special troops school, with its parachute battalion. Troop strength in each of the garrisons rarely exceeds a thousand. The six engineer battalions operate in the interior on development projects. The two ranger battalions are also in the interior. The infantry battalions are scattered between the headquarters, one in each. The cavalry, motorised and artillery regiments are at the main bases.

Recent Operations

With covert American assistance, the Bolivian army successfully concluded in 1967 what has become the most celebrated (or notorious) anti-guerrilla operation in recent Latin American history: the extinction of Ché Guevara's band on the headwaters of the Río Grande, where he was seeking to foment people's war among an uncomprehending peasantry. There has been no serious attempt since.

ORGANISATION

The army is divided into five main branches: infantry, artillery, cavalry, engineers and signals, together with the usual services. Operationally, divisions exist in name, but the largest operational unit is a battalion. The infantry regiments have traditional or regional names (*Ingavi*, *Castrillo* and *Colorados*, the latter the presidential guard battalion at La Paz).

The Bolivian State Police (Corps of Police and *Carabineros* of Bolivia) is modelled on the *Carabineros de Chile*. It is a centrally controlled, militarised force, which may be treated as a reserve of the army in time of war. A 'brigade' is stationed in each of the departments, divided into urban and rural sections. There are additional detachments in troubled areas, such as San Ignacio de Velasco and Tupiza, and two separate regiments in the capital. The strength of the corps in 1970 was 5000, of which half was stationed in La Paz. It was reorganised and trained on American lines by an American training mission in 1976.

RECRUITMENT, TRAINING AND RESERVES

Recruitment and Training

Since 1904 recruitment has been by conscription of the male population at the age of eighteen. In practice, only a proportion

* Corbett, Charles C., *The Latin American Military as a Socio-Political Force*, University of Miami Press (1972).

World Armies

of the annual contingent is enlisted, apparently on a haphazard basis of selection. Almost all the conscripts are Indians. NCOs are time-expired conscripts.

Officers are recruited exclusively from the military academy (*Colegio Militar*, founded 1891) at La Paz, entry to which is highly competitive; there are about 800 to 1000 applicants for 100 to 150 places each year, of whom about 75 to 85 eventually graduate. Recruitment is exclusively from the white or *mestizo* middle class. Subsequent training is given at the arms school (*Escuela de Aplicación de Armas*) and, for the chosen, at the staff college (*Escuela de Estado Mayor*, founded 1938), both at Cochabamba. There is a war college (*Escuela de Altos Estudios Militares*, founded 1960) for senior servicemen and civilians at La Paz. Officers go every year to schools in Argentina, Brazil, Peru and the United States, postings which are much coveted. There is a military engineering school at La Paz, to which the army's engineer officers may go for a professional qualification. NCOs are trained at the *Sargento Paredes Escuela de Clases*, Cochabamba. Conscripts are trained in the units.

An Italian military mission founded the staff college; Argentinian and American military missions have influenced officer training since 1956.

Reserves

Apart from the police and the pool of discharged conscripts, there appear to be no reserves. The workers' militias might be called on in the case of war.

EQUIPMENT AND ARMS INDUSTRY

Bolivia has no domestic arms industry, and does not even appear to manufacture small-arms ammunition. It may procure supplies of the 7.62mm cartridge from its neighbour, Colombia, which is a manufacturer, or from the United States.

Rifle: 7.62mm SG510 (Switzerland) and 7.62mm G3 (Germany)

Artillery: 75mm M-116 pack howitzer (USA; 25 in service), 105mm FH-18 howitzer (Germany, obsolete; 20 in service) and 105 M-101 howitzer (USA; 25 in service)

Armour: M-709 Commando armoured car (USA; 10 in service), Mowag APC (Switzerland; 20 in service) and M-113 APC (USA; 18 in service)

Aircraft: the air force operates 12C-47s, which would provide lift for the parachute battalion, and about 15 helicopters

RANK, DRESS AND DISTINCTIONS

The President is *ex-officio* Captain-General of the Armed Forces, a rank popularly known as 'marshal'. Ranks then run on the American system from major-general to second-lieutenant. Non-commissioned ranks are warrant officer (four grades), sergeant (two grades) and corporal. Badges of rank and uniforms follow American styles, except that ceremonial uniform, when worn, is Prussian. There are a number of military orders and decorations, of which the most senior is the Condor of the Andes.

CURRENT DEVELOPMENTS

Colonel Banzer's presidency has been one of the most unsettled periods of modern Bolivian history, not only for the country but also for the army and the rest of the armed forces. There have been, besides the announcements of forestalled coups, four major military rebellions, one by the right-wing faction and three by the left-wing faction within the armed forces. In December, 1972 supporters of Torres and Barrientos staged a mutiny at the El Alto air base, near La Paz, as a result of which Banzer dismissed the Chief of Staff. In May, 1973 Colonel Selich, a former Minister of the interior to Banzer and commander of the ranger battalion which had played the key role in his coup, was arrested re-entering the country from exile and died in the hands of the police. Señor Arce, the current Minister of the Interior and first civilian to be appointed to Banzer's cabinet, disclosed that Selich's death was murder, which led to a protest by the commander of the key Cochabamba garrison, and another by the *Falange Socialista Boliviana*, the MNR's main party of opposition which commanded a considerable following in the armed forces, and to the resignation of Señor Arce. Claiming the threat of a coup, Banzer replaced all the leaders of the armed forces and assumed direct supreme command himself. In January, 1974 while he was visiting the south of the country there was a revolt by the *Tarapaca* armoured regiment in La Paz, where its officers seized the presidential palace. They were expelled without bloodshed, but a month later Banzer, who claimed that the officers were *barrientistas* (i.e. supporters of his left-wing predecessor), dismissed his civilian-military cabinet and replaced it with an all-officer one. In November of the same year, a left-wing military rising had to be put down with troops

brought from La Paz. And in January, 1976 alleging the discovery of a 'vast communist plot', the President replaced all the service commanders-in-chief.

All this had taken place against the background of continuing civil strife. In January, 1974 peasants and workers of the Cochabamba region closed the roads into the city, which had to be opened by military action at the cost, the Catholic hierarchy alleged, of a hundred civilian lives. A 'state of siege' was proclaimed, which was extended in April for another 3 months, the underlying cause of the disturbance, namely high inflation and static wages, not having been cured. In November, 1974 as a result of the military rebellion in Santa Cruz, the President postponed indefinitely the elections which he had first promised for mid-1974, then postponed until 1975 because of his decision to concentrate national attention on the recovery of 'access to the sea' (*see* Chile). There were further strikes and disturbances in January, 1975 despite the existence of the 'state of siege' proclaimed in November. It was lifted in February, but had to be reimposed again in January, 1976 following the murder in Argentina of ex-President Torres, his widow alleged at the hands of the Bolivian military attaché in that country. Troops were sent to occupy the mining regions and remained there even after the 'state of siege' was lifted in July.

In November, 1977 the internal state of the country had stabilised sufficiently for President Banzer to announce the advancement of elections from 1980, the date he had set in November 1974, to 1978. He also laid down a timetable for return to civilian rule: first, a stage of 'institutionalisation', when the parties and trade unions, placed 'in recess' in November, 1974 would be allowed to operate again, and then in 1980 a stage of 'constitutionalisation' when an elected government would reintroduce constitutional forms, of a new sort. But he warned that certain exiled left-wing leaders would not be allowed to return, nor to benefit from amnesty. He also insisted that his decision to bring forward elections was a decision of the armed forces, not influenced by external events, which implied a warning to dissidents within the country. Whether he will be able to carry a united army through the stages he has forecast remains to be seen. The upper levels have been extensively purged of opponents, but the lower ranks are probably still divided into right-wing and left-wing factions.

JOHN KEEGAN

BOTSWANA*

The Republic of Botswana began the raising of a small army, the Botswana Defence Force, in 1977. Few details of this are yet available. It is to include a regular and a reserve component. The majority of the first soldiers were found from the PMU or Police Mobile Unit, the Deputy Police Commissioner, Mompoti Merathe, being appointed BDF Commander in the rank of major-general. The Second-in-Command is Brigadier Ian Khama, the son of President Seretse Khama.

The Botswana government announced that it would buy weapons from a variety of sources; in practice the BDF is very largely equipped with the FN rifles purchased from Britain. However a small consignment of Chinese small arms has also been reported and some personnel have Soviet weapons acquired from — or left behind by — insurgents. One or two of the BDF's officers who had served previously with the PMU had received military training in Britain.

The role of the BDF is to patrol the Rhodesian border. In this it has not so far been very successful, sustaining casualties, arising from a misunderstanding, in a clash with the Botswana police, and receiving a severe mauling in an encounter with a Rhodesian army force in February, 1978, 15 soldiers being killed.

BRAZIL

HISTORY AND INTRODUCTION

Even when Brazil's armed forces have seemed to conform to the pattern of political behaviour familiar amongst the Spanish-speaking countries of Latin America, the resemblance has been more apparent than real. The only case of overt and prolonged military takeover of the governing function in Brazil has been the period since 1964, and neither in its motives nor in its goals is this period of military rule fully comparable to those which are typical of military coups in Spanish-American countries.

While there has been a certain convergence of political behaviour amongst all Latin American armed forces due to the influence of USA-derived counter-insurgency doctrine in the past two decades, the fundamental distinctions which characterise the Brazilian armed forces remain dominant. The difference of greater historical weight is the fact that Brazil did not experience savage and lengthy war which would have made the armed forces the pre-eminent institution of the State (as was true almost everywhere else in Latin America) in order to achieve its independence. Latterly, the fact that this country, unlike any of its Latin American fellows, can and does nourish the ambition to become a great power on a world scale in the twenty-first century has also profoundly affected the behaviour of Brazil's armed forces.

During the period of Portuguese rule, which lasted for over half of Brazil's history as an area of European settlement, the imperial government preferred to depend on officers and men recruited mainly in the home country to fight the colonial wars which were waged against Spain in La Plata and against Dutch incursions in the north-east. Portuguese imperial administration exercised a far looser control than the Spanish, however, and from an early time landholders were made responsible for defending themselves against Indian attacks, slave risings and even foreign incursions. Thus, nearly every plantation in Brazil had its private army, numbering in the hundreds or even thousands, under the purely nominal control of the Portuguese administration. Following the period 1580–1640 when Portugal fell under Spanish rule, and the Dutch took advantage of Spanish neglect to seize Recife and establish control over the entire northern coast of Brazil, it was primarily native volunteer forces of this type, organised as the *Terço de Ordenanças* (Regimental Command), which expelled the Dutch from Brazil in 1654 and founded an independent Brazilian military tradition.

The Napoleonic Wars prepared the way for Brazilian independence. When Portugal itself was occupied by French forces in 1808, Brazil became the residence of the royal family and the governing centre of the shrinking but still impressive Portuguese empire. The possibility of a revolution like that which burst on Spain's American empire in 1810 was met by the decision to raise Brazil to dominion status within the empire in 1815, and by the policy of reserving the highest posts of command in the army and navy for men from the Iberian peninsula.

The hostility of creole officers to this policy, and the resentment of the native economic oligarchy at heavy taxation which went to support the perpetuation of an empire run largely for Portugal's benefit, constituted the possible sources of a Brazilian revolution on the Spanish-American model, but Braganza family politics soon foreclosed this avenue of development. King John VI and the imperial government belatedly returned to Lisbon in 1821, but in the following year his son Pedro, who had remained behind in Brazil, declared in São Paulo for 'independence or death'. He was crowned Emperor of Brazil in December, 1822 and thus Brazilian independence was achieved almost without bloodshed, the Portuguese troops in the country either swearing allegiance to Pedro, or offering only token resistance before accepting repatriation.

This peaceful transition to independence was largely the handiwork of the distinguished scholar and statesman Jose Bonifacio de Andrade e Silva, an intelligent and subtle conservative who was one of Pedro's first and closest advisors. Andrade e Silva's purpose was precisely to avoid the chronic violence, the importation of radical political ideas derived from Rousseau and the French revolution, and the military domination of civilian affairs which was already becoming evident as Spanish-speaking America's inheritance from the long wars of independence, and he was almost entirely successful. The Brazilian armed forces were deprived of the opportunity to make themselves the heroes of the independence struggle, and the economy and society were left untouched and unaltered by the ravages of war.

The Brazilian armed forces declined even further in public esteem compared to those of their neighbours during the reign of Pedro I, due to his continued preference for retaining Portuguese-born officers in the higher ranks and his war against Argentina, begun in 1828, which led to the creation of the buffer state of Uruguay. Even before Brazil finally lost the war, its unpopularity was causing young men to flee their homes in order to avoid military service, and it had become necessary to bring in numbers of German and Irish mercenaries. In 1831 Pedro I was forced to abdicate in favour of his five-year-old son and to return to Portugal, but again it was civilians who were at the head of the Brazilian political forces compelling this change.

During the succeeding 15 years Brazil was wracked by major separatist or federalist revolts in almost every region, fought largely by armies raised by levies on the plantations, but also involving desertions of regular units to the

World Armies

revolutionary side on some occasions. The centralised authority of the government survived, however, and the rebellions soon died out after Pedro II's assumption of full powers in 1840 (at the age of fourteen) ended the interregnum. The Brazilian armed forces, though always consulted and taken into account by the emperor's advisors, remained a subsidiary element in the empire's government at least until the 1870s.

The war against Argentina in 1852, resulting in the downfall of the Argentine dictator Juan Manuel de Rosas, had little effect on the size or status of the Brazilian armed forces, but the long and hard-fought War of the Triple Alliance (Brazil, Uruguay and Argentina against Paraguay) in 1864–70 had a profound influence on the future attitudes and actions of the Brazilian armed forces. At the beginning of the war the Brazilian army totalled only 17,000; by the end it had over 100,000 men in the field, and had suffered between one-third and one-half of that number in casualties. While its strength was quickly reduced again after the war, the army's new sense of its own importance, sharpened by the manifest ingratitude of the civilian authorities, worked a permanent change in the army's view of its proper relationship with the State.

The years after 1870 saw the onset of a steep decline in the stability of the empire's political structure in any case, due to Church–State quarrels, the growing pressure to emancipate Brazil's slaves, and the progressive decline in the Emperor's health, but it was the changes taking place in the army which were of the greatest importance. Indeed, it could be argued that the years 1870–89, culminating in the almost bloodless military overthrow of the empire, were the period when the Brazilian army's distinctive character and pattern of behaviour emerged and became settled.

The army officer corps of the 1870s and 1880s had already become a self-conscious institution, jealous of its prerogatives and resentful of the way in which the armed forces were being starved of funds by the governments of the day. The officers were largely of lower-middle-class origin, the army being one of the very few avenues of rapid social advancement available in imperial Brazil, and they had little sympathy for the slave-owning aristocracy of the north-east or for the imperial system of which it was a principal buttress. Commanding an army in which the enlisted men were almost exclusively Negro ex-slaves, army officers were familiar with the abolitionist arguments and generally supported them. The then-fashionable positivist theories of Auguste Comte, with their stress upon progress and social authority, became virtually gospel in the military academy by the mid-1880s, predisposing a whole generation of officers to republicanism and activism.

On a less-exalted level, officers were encouraged to enter politics by competing civilian parties, and from 1883 the increasingly sensitive officer corps as a whole became embroiled in an interconnected tangle of bitter disputes with the government — the so-called 'military question' — over quite petty points of personal privilege. The final straw may have been the government decision in 1889 to organise a National and Civic Guard which would equal the army in strength by the end of the year, but the collapse of the empire was already a foregone conclusion (slavery was abolished early that year). On November 15th, 1889 Marshal Manoel Deodoro da Fonseca, the acknowledged leader of the officer corps, announced the overthrow of the government and declared a republic. There would never again be a government in Brazil that did not rely upon at least tacit military support.

It is important to observe, however, that a tradition of direct military rule did not become established. Marshal Deodoro made himself President and instituted a frankly military regime that was continued by his immediate successor, Marshal Floriano Peixoto, but widespread disorders in outlying areas and sharp rivalry between the monarchically inclined navy (predominantly white and of aristocratic origins) and the republican, ethnically mixed army prevented the emergence of a settled military regime. This was not desired by Brazil's military leaders in any case. Marshal Deodoro helped to draft an explicitly civilian constitution for the republic, and in 1894 Marshal Peixoto passed the presidency into civilian hands, where it remained until 1964 (although a general was elected to the presidency in 1910–14).

In most respects, indeed, the Brazilian republic in its first three decades was little different from the empire it replaced; it remained a plantation economy dominated by the same political class that had monopolised leadership under the empire, strongly regional and with only rudimentary public opinion. The most noteworthy changes were the great enhancement in the social status of military officers (accompanied by a marked improvement in their economic conditions), and a continued high level of military influence from behind the scenes on the course of civilian politics. One might perhaps also attribute the heightened interest in material progress in post-imperial Brazil to the armed forces, which thanks to a well-developed military education system then possessed a very high proportion of Brazil's technically and scientifically oriented personnel.

By the 1920s, however, Brazil was beginning to evolve the rudiments of a modern economic and social structure. The shift of the economic centre of gravity from the north-east to the industrialising south-central region was almost complete, and there was for the first time an urban working class (albeit a small one) in Brazil's growing cities. The continuing influence of the positivist tradition on the army's junior officers (though not on their seniors) was clearly demonstrated in the quixotic revolt of the Copacabana garrison in 1922, and the far more serious Tenente (Lieutenant) uprising in São Paulo in 1924. While these revolts by officers of lower-middle-class origins can best be explained as a generalised protest against the corruption and stagnation of the existing regime, given specific direction by their technical military training and their professional orientation towards disciplined organisation, the programme of the Tenentes prefigured much that was typical of the Vargas regime in 1930–45 and of the military governments since 1964.

The Tenente revolutionaries of 1924 demanded minimum wages for labourers and regulation of work for women and children, while strongly opposing the anarcho-syndicalist trends that were then prevalent in Brazil's largely immigrant industrial workforce. While not opposed to private capital, they favoured State ownership of natural resources, and took a

far more nationalistic attitude towards international trade than was then prevalent in Brazil or anywhere else in Latin America. They favoured the development of Brazil's vast interior frontier and the expansion of government's role in order to protect the common man. They saw government as a benevolently authoritarian institution, and the armed forces as redeemer of the nation. It is scarcely surprising that many of them ended up as collaborators in Vargas's proto-fascist 'New State', while others (notably Luiz Carlos Prestes) subsequently became leaders of the Brazilian Communist Party. Nor is it surprising that the senior officers who created the post-1964 military regime were themselves junior officers during the ferment in the army in the 1920s.

The 1924 revolt was quickly suppressed by loyal military forces, and even the 5000-mile march of the *Coluna Invicta* (invincible column) through the Brazilian backlands led by Luiz Carlos Prestes was over by 1927. But it was the same sort of officers in the army (including some of the original Tenentes, newly returned from exile) who provided the leadership for the armed revolt which brought Getulio Vargas to the presidency in 1930 after his Liberal Alliance had been cheated at the polls. Although many of the Tenentes soon defected when Vargas showed himself willing to compromise with senior officers and the established political forces (and some took part in the abortive revolt of 1932), others continued to support him even after he inaugurated his corporatist 'Estado Novo' in 1937. So did their senior officers, who were equally attracted by his lavish spending on the armed forces and by his authoritarian emphasis on order and industrial development.

The initially undifferentiated reformism of the junior ranks in the armed forces had already split into communist and anti-communist strands by 1935, however, when almost the entire firepower of the abortive communist *putsch* of that year was provided by dissident army officers and NCOs. The post-1964 purges have now eliminated this communist strand of opinion from the regular armed forces, but it can be argued that all of Brazil's native political movements aimed at imposing radical reform from above had their origins in the armed forces of the 1920s and 1930s.

The initial military support for Vargas's authoritarian State began to wane rapidly, however, once he began to seek to replace his declining middle-class support by building a new political base amongst the working class. Brazil's participation in World War II (it was the only Latin American State to send armed forces to Europe) contributed to the army's soaring prestige, and thoroughly permeated the army with the anti-fascist sentiments that animated the alliance within which it fought. As a result, the army forced the resignation of Vargas, the dismantling of the corporate State, and the holding of democratic elections in 1945.

The democratic 'interlude' of 1945-64 (as it now appears) found the armed forces continuously involved in politics, while always refusing the last step of direct intervention. The problem which confronted the army in this period was one which is familiar to armies in most rapidly industrialising States that attempt to maintain a democratic system: the military priorities of rapid economic development and national discipline repeatedly clash with the tendency of democratic politicians in such States to seek support amongst urban workers by promising immediate and rapid improvement in living standards. Thus the armed forces had to permit a protégé of Vargas's to assume the presidency in 1945, unless they were prepared to invalidate the elections entirely. In 1950 they had to allow Vargas himself to return to power, though only on the understanding that he would not renew his attempt to build support on the left. When his Minister of Labour, Joao Goulart, did attempt such a manoeuvre in 1954, senior military officers forced his dismissal, and later in the year demanded Vargas's own withdrawal. Instead, Vargas committed suicide.

The last 10 years of the democratic regime in Brazil were marked by repeated civil-military clashes, including brief military interventions in 1955 and 1961 in which the soldiers withdrew again after obtaining their immediate political objectives. Military candidates for the presidency were soundly defeated in the elections of 1950, 1955 and 1960, and those defeats were accepted by the armed forces, but the successful civilian candidates in each case were compelled to rule within the constraints imposed upon them by military opinion. The principal issue was invariably the concern of the armed forces that politicians should not make demagogic appeals to the growing urban working-class electorate (numbering about 5,000,000 by 1950).

The main restraint on full military takeover before 1964 was the existence of a dominant faction within the army which, with powerful civilian political allies, persisted in believing that the existing democratic political structure could be manipulated to contain this danger. Harder-line officers within the army, and the generally more conservative navy and air force, were effectively deterred from pushing for comprehensive intervention in politics by the fear of splitting the armed forces. The crises of the period were generally resolved by compromises like that of 1961, when the leftward-leaning Vice President Joao Goulart was permitted to succeed to the office of president after his predecessor had resigned in frustration, but only on condition that his powers be restricted by a change to a parliamentary rather than a presidential form of government. Throughout this period, moreover, there were steadily mounting numbers of officers serving on detached duty in key positions in civilian government departments and national agencies concerned with industrial development (the figure of 1100 has been suggested for 1961), which gave the armed forces further confidence that their views would be heeded.

This civil-military *modus vivendi* broke down permanently in 1964 for a number of reasons. President Goulart's drive to recover full powers, his political co-operation with the Communist Party, and his tacit encouragement of a militantly nationalist left-wing movement in order to increase his freedom of manoeuvre all alarmed the armed forces, while the dire economic situation — runaway inflation and rising popular unrest — seemed to them to demand decisive action which his government was politically incapable of taking. The most important motives for the military takeover, however, were the heightened attention paid to internal security questions by the armed forces in this post-Castro period, when armies all over

World Armies

Latin America were frantically preparing themselves to deal with communist insurgencies (real or not), and the specific suspicion that President Goulart was trying to build up a following among non-commissioned officers that would counterbalance the officers' corporate political influence. On March 25th, 1964 Goulart indicated that some 3000 sailors and marines who had rebelled against their officers, calling for basic social reforms, would receive an amnesty; on March 31st–April 2nd the armed forces, with support from several State governors and most of the country's powerful economic groups, deposed Goulart.

Although few officers could have envisaged at the time that the armed forces would still be ruling Brazil a decade and a half later, the intervention was from the first a new departure in Brazilian history. Contrary to civilian expectations, the soldiers did not retire in favour of some new civilian politician. They arrested over 7000 persons on charges of subversion and corruption within the first week (including a great many politicians), issued decrees empowering the high command to suspend constitutional guarantees, cancel the mandates of elected officials at all levels, and deprive individuals of the right to vote or hold office for 10 years, and on April 11th, 1964 they compelled a decimated Congress to elect Marshal Humberto Castelo Branco to serve out Goulart's unexpired term. By the end of 1964 President Castelo Branco had removed some 9000 military officers and over 100 elected politicians from office as part of the 'moral rehabilitation of Brazil', while 378 of the country's most influential political and intellectual leaders had been deprived of their political rights.

The perceived threat of total social breakdown and Castroite insurgency which played a large part in motivating the military coup of 1964 was a mirage, but in broader terms Brazil's military leaders had accurately analysed the country's political problems. They were remarkably sophisticated men by Latin American military standards: almost all belonged to the circle of commanders who had fought in Italy during World War II, and had participated in the founding of the Superior War College in 1949. In this school senior officers of the three services and selected civilians had been engaged in continuous study of Brazil's political, economic and military situation and had evolved a common set of priorities in which (alongside an increasingly explicit anti-communism) first place was given to a strong nationalist drive to make Brazil a genuine great power — by the turn of the century, in the usual formulation. The USA-promoted counter-insurgency doctrines which were such a powerful influence on all Latin American armies in the early 1960s lent a sharper edge to their anxieties about Brazilian domestic developments, but the basic thrust of policy is more clearly illustrated in the growing penetration of armed forces officers into executive positions in the nationalised industries throughout the period after 1950.

The corporate view of the Superior War College on Brazil's political malaise quite accurately saw the basic problem to be the inability of the established order (including the armed forces themselves) to come to terms with the political power gained by the radical, labour-based popular movement created by Vargas. (The analogy with Perón in Argentina is close). Moreover, in the view of many senior officers and their civilian associates (especially in the economics faculties of the universities), it would not be possible to achieve the rate of economic growth necessary to achieve Brazil's great-power ambitions if the political structure were forced to accede to the demands of this movement for immediate and large rises in the living standards of the mass of Brazilians. Therefore, if the existing political structure could not contain these demands, one must be created that could.

It was by such a logical progression that Brazilian senior officers arrived, half-unawares, at the necessity of creating a permanent military government. It was not a conclusion accepted all at once, nor indeed has it ever been accepted in precisely those terms. Each step towards it was taken with as strict an observance of the constitutional forms as the military leadership felt the situation allowed — not a great deal, in some cases. Throughout this period there has been visible behind the manoeuvring of hard- and soft-line factions within the armed forces a persistent hankering to evolve some sort of restructured political system (such as the attempt to create a two-party system *by fiat*) that would safeguard the military position and the great goal of world-power status while permitting some popular safety valve in the form of a more or less representative government. Thus, for example, while the rulers of Brazil since 1964 have all been army-dominated generals, there have been regular elections — held under varying degrees of coercion — in an attempt to gain popular validation of their position.

The presidential elections scheduled for 1965 were postponed, but President Castelo Branco proceeded with the elections for governors in half of the 22 States. When more than half the winners proved to be from amongst the opposition candidates, however, the military government moved quickly to entrench itself. In the same month Castelo Branco issued Institutional Act No. 2, in which he asserted his right to suspend Congress and rule by decree, and decreed that in future the president would be elected indirectly by the Congress. He also dissolved all existing political parties and ordered the creation of an official government party, ARENA, and a tame opposition party, the MDB. In October, 1966 Congress obediently elected his successor, Marshal Artur da Costa e Silva, the man chosen by the armed forces, to the presidency, and in 1967 a new constitution was enacted by Congress that further increased the power of the presidency at its own expense.

His legal position thus assured, President da Costa e Silva proceeded to a partial 'civilianisation' of the government — half his 22 Cabinet members were civilians — and to a 'humanising' of the harsh austerity measures that had been imposed by his predecessor in a largely successful attempt to bring down the catastrophic rate of inflation. This trend was soon halted, however, by the emergence at last of the Marxist insurgency that the armed forces had been anticipating for so long.

The first Castroite rural guerrilla band, which was rounded up in Minas Gerais in 1967, included many non-commissioned officers who had been dismissed from the army in 1964, while the two best-known leaders of the urban

guerrillas who had largely supplanted them by 1969, Carlos Marighela and Carlos Lamarca, were former army captains; but the main strength of the movement lay in radical middle-class university students for whom all other avenues of political expression had been closed by 1968. The urban guerrillas' bank robberies, raids on military installations and kidnappings (during 1969–70 they kidnapped the ambassadors of the USA, West Germany and Switzerland) were designed to harass and embarrass the government, and did not add up to a strategy offering any discernible prospect of success, but the military government's reaction was extreme.

In December, 1968 Congress was recessed indefinitely and a further wave of arrests was carried out; in September, 1969 just after President Costa e Silva succumbed to a stroke, the country was declared to be in a state of 'internal revolutionary war'. General Emilio Garastazu Medici, former Head of the National Intelligence Service, was selected by the Armed Forces High Command to serve as president for the next 5 years, and a campaign of unrestricted official terror — including regular use of torture, kidnappings and death squads — was unleashed against the leftist guerrillas and those suspected of being associated with them. It accomplished its aim so effectively that the guerrillas were a moribund force by 1971, and in February, 1973 the four main guerrilla organisations jointly recognised that their campaign had failed (while not retracting their ideological commitment to armed insurrection in the long term). Shortly after General Ernesto Geisel succeeded to the presidency in 1974, a series of transfers and arrests within the army brought an end to the worst excesses of the governmental campaign of counter-terror.

With the guerrilla crisis past, Geisel resumed the armed forces' attempt to institutionalise the regime, allowing relatively free elections to Congress in 1974 (in which the opposition MDB won the senatorial race in 16 of the 22 States) and lifting censorship on most of the press in the following year. The intractable difficulties involved in trying to reconcile a measure of democracy with the armed forces' wishes for Brazil were underlined once more in 1977, however, when the MDB defeated government-sponsored judicial reforms in Congress. Geisel responded by closing Congress, and re-writing the electoral rules so that senators and State governors will no longer be elected directly, but rather chosen by government-controlled electoral colleges.

While the army's direct tenure of power has lengthened far beyond its original expectations due to its inability to create a stable civilian political structure that will function to its own satisfaction, its central ambition of achieving rapid economic growth has nevertheless been largely fulfilled. Following a short period of stringent austerity while the economic chaos of 1964 was being brought under control, Brazil regularly achieved 10% economic growth rates in the late 1960s and early 1970s. Being heavily dependent on imported oil, it was exceptionally hard hit by the 1973–4 oil crisis and subsequent price increases, but within a couple of years had recovered to a quite respectable 6% growth rate. If this pattern can be maintained, the goal of becoming a fully industrialised power of the first rank within a single generation remains within reach.

The price of this rapid growth is paid by the mass of the working population, especially in the crowded cities, whose real income has fallen considerably since the coup of 1964. It is the classic formula for rapid industrialisation under any political dispensation — squeezing the resources for investment out of the mass of the population — but it underlines the political dilemma of Brazil's military rulers. While the senior officers of the armed forces are loosely aligned into harder- and softer-line factions, over the issues of authoritarian rule versus the maintenance of the constitutional facade, of straightforward repression of dissent versus relative tolerance, of lenient policies on foreign trade and investment versus economic nationalism and etatism, they are alike hemmed in by the realisation that they cannot pursue their economic/political goal of making Brazil a great power quickly and at the same time enjoy the sort of popular support that would make genuinely representative institutions possible. When forced to choose between these alternatives, as they regularly are, they invariably prefer the former.

STRENGTH AND BUDGET

The strength of the Brazilian armed forces in 1976 was 273,000 of whom 113,000 were conscripts. The army was the largest force, numbering 182,000. The navy's strength was 49,000, including 13,500 Fleet Air Arm personnel and marines, and the air force numbered 42,800. All but 3000 of the conscripts were serving with the army, in which they made up 60% of the total strength; the remainder were in the navy.

Under the Brazilian constitution, 1 year's military service is compulsory for all males, but in fact conscription is highly selective as over 1,000,000 Brazilian males reach military age each year, far exceeding the armed forces' requirements. The total strength of the armed forces is a modest 0.25% of Brazil's population of 115,000,000.

There is no organised reserve system, but the immediate reserve of trained men is estimated to be about 250,000. Paramilitary forces under armed forces command include the military police (sometimes known as the State Militia) numbering around 200,000 men, which serves as an auxiliary reserve force for the army.

Brazilian defence expenditure in 1976 was 18,355,000,000 cruzeiros out of a total budget of 139,000,000,000 cruzeiros; within the defence budget, the army's allocation was 7,200,000,000 cruzeiros, the navy's was 4,400,000,000 cruzeiros and the air force's was 4,700,000,000 cruzeiros. Thus defence took less than 14% of government expenditure, and a relatively modest 1.8% of GNP. While defence outlays have increased in absolute terms over the past decade, they have not kept pace with the rapid growth of the economy, and indeed have dropped to half the share of GNP (3.2%) which they took in 1965, the first full year of the military regime. In 1978 the total defence budget was \$2,400,000,000.

World Armies

COMMAND AND CONSTITUTIONAL STATUS

Under Section VI, Articles 90–93 of the Constitution of 1969, the navy, army and air force are permanent institutions under the authority of the President of the Republic. Their size, composition and budget are to be voted annually by Congress upon the recommendation of the President. If Congress is not in session, these matters are to be handled by decree law.

In his capacity as Supreme Commander of the Armed Forces, the President is constitutionally allowed to declare war after it has been authorised by Congress, and without such authorization in case of foreign aggression occurring between legislative sessions. He is also authorised to declare partial or total mobilisation and to proclaim the existence of a state of siege and rule by decree. The president is indirectly elected to a term of 5 years by an electoral college consisting of all members of the National Congress, three delegates from each State legislature, and one extra delegate for each half-million voters. Since all these electors are themselves chosen by one or another form of electoral college, it is quite simple for the military government to arrange the election of a new president once the armed forces have decided who it should be. The president is not immediately eligible for re-election.

In his military capacity the president is assisted by government organs including the National Security Council, the President's Military Household, the Armed Forces General Staff and the Ministries of the Army, Navy and Air Force. (There is no overall Ministry of Defence in Brazil, as navy and air force anxieties about army domination have always made its creation impossible despite the army's most strenuous efforts to create such a body.)

According to Article 87 of the Constitution the National Security Council (NSC) is the highest-ranking body to advise the President in the formulation and execution of national security policy; it also bears general responsibility for strategic defence planning. The NSC is made up of the President, Vice-President, all 16 Cabinet Ministers (about half of whom are usually military officers), the Chief of the Armed Forces General Staff, the Chiefs of Staff of the Navy, Army and Air Force, the Chief of the President's Military Household, and the generals and admirals commanding major commands. It is, in other words, so large in membership as to be of only ceremonial significance, but an abbreviated version of it is believed to function as an actual executive body.

The Ministers of the Army, Navy and Air Force are invariably military personnel appointed by the President for an indefinite tenure of office, and are responsible for the supervision and control of their respective forces. They report directly to the President except in matters of concern to other services, in which case they co-ordinate them through the Chief of the Armed Forces General Staff.

The Armed Forces General Staff is a joint all-service organisation without command functions, charged with the development of war plans and organisation and with inter-service administrative co-ordination. The President's Military Household, besides having responsibility for the security of the presidential palace, acts as the President's chief instrument of liaison with the armed forces ministries and other departments of government.

In 1978 the President was General Ernesto Geisel; his associate, General João Baptista de Oliveira Figueiredo, former Head of the National Intelligence Agency (SNI), had already been chosen to succeed him in 1979. The Chief of the President's Military Household was General Moraes. The Minister of the Army was General Fernando Belfort Bethlem; of the Navy, Admiral Geraldo Azevedo Henning; and of the Air Force, General Joelmir Campos de Araripe Macedo.

The actual (as opposed to constitutional) source of the President's authority, the real body which chooses presidents, and the final arbiter of major policy decisions in Brazil, is the so-called 'College of Generals', an informal organisation of about 120 army and air force generals, 60 admirals and 60 brigadiers. Within this body the army is much the most influential body of opinion, and the views of the 10 generals on the Army High Command (*see* Organisation: Arms of Service) are of particular moment. It is within the 'College of Generals', hidden from public view, that real politics in Brazil takes place; its relative importance in the Brazilian scheme of things may be deduced from the fact that only one of Brazil's four recent military presidents (Geisel) has succeeded in obtaining its approval for his own candidate as successor.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

In fact, and even in constitutional law, a principal role of the armed forces since the foundation of the republic in 1889 has been to exercise the 'moderating power' previously provided by the emperor over the politics of the country, and to guarantee its unity. Some clause to this effect has been incorporated in every Brazilian constitution since 1891, and has been seen by the army as giving it the right and the duty of arbitration when political crises occurred. In the earlier years of the republic this function was largely exercised in defence of national unity and federal authority, as the armed forces were the main organisation of truly national scope in a country riven by regional rivalries. Increasingly in recent decades, as regional particularism receded, the army's 'moderating power' has been applied to the arbitration of political conflicts on the federal level, and since 1964 has been expanded to encompass the suppression of civilian politics and direct military rule. In terms both of Brazil's history and of the army's own preoccupations, this has long been its primary role.

National military defence has taken second place because of Brazil's relatively safe geopolitical situation: the country has actively fought in only one war in this century, and that only by way of an expeditionary force fighting in Europe. It does

have genuine military concerns, however, both within the South American continent and in the wider field of the East–West confrontation.

Brazil occupies 3/7ths of South America and has approximately half the continent's population. It has more neighbours than any other sovereign State except the USSR: only Chile and Ecuador among South American countries do not share a common border with it. As the sole Portuguese-speaking nation in an otherwise Spanish-speaking continent, it is very much the odd nation out, and as a relative giant with great ambitions it often excites suspicion and anxiety amongst its smaller neighbours.

This anxiety is particularly acute because most of Brazil's borders with her neighbours run through sparsely populated Amazonia, a hinterland into which the Andean nations have scarcely pushed the borders of settlement and development, but where on the other side of the frontier Brazilian settlers are pushing forward in greater numbers each year. Seven thousand miles of new roads have been cut through the Amazonian forests of Brazil in the past decade, running to the borders of Venezuela, Peru, Bolivia, Guyana, and almost to Surinam, and where the roads go the settlers quickly follow. In a few places (notably in the empty eastern plains of Bolivia) they are already spilling across these unmarked frontiers, and wherever they go they trade only with Brazil.

Although almost all of Brazil's frontiers with her neighbours were formally settled by a series of agreements concluded in 1910 (and in only one case, over territory disputed with Bolivia, did Brazilian troops become directly involved), nevertheless there exists a continuing nervousness amongst those Andean nations whose own Amazonian territories are almost totally undeveloped. This anxiety played a large part in causing the lengthy delays in the negotiation of a 'multilateral co-operation pact' for the co-ordinated development of Amazonian water resources and the protection of the local ecology which was proposed by Brazil to its western and northern neighbours (it was finally agreed in mid-1978). The fact that the Brazilian armed forces are very heavily engaged in providing transportation and other essential services in these frontier regions is seen as a matter of sheer practicality in Brazil, but is a further cause of suspicion of Brazil's expansionary designs amongst its neighbours — so much so, in Peru's case, that it has deliberately refrained from building its section of the Transamazonia road, planned to link the Atlantic and Pacific coasts of the continent, and now completed within Brazil.

In addition to this general suspicion, there exists an acute and long-standing rivalry between Brazil and Argentina, founded in the wars of the Plata region in colonial times and during the nineteenth century, and nourished by the ambition of each nation to be the leading power in South America. Each country's armed forces have traditionally set their requirements for sophisticated weapons largely in terms of maintaining the military balance with the other, and even the question of the acquisition of nuclear weapons (which has been seriously discussed in both Argentina and Brazil — see Equipment and Arms Industry) has been examined almost exclusively in terms of the rival's possible intentions in the same direction.

There are no Argentine–Brazilian border disputes, and indeed the common frontier between the two countries is very short, but there is great rivalry between the two for predominant influence in the buffer States of Paraguay and Uruguay. Latterly Brazil has been notably successful in making major inroads in this historically Argentine sphere of influence, and conflicting Paraguayan–Brazilian and Paraguayan–Argentine projects for the construction of enormous hydroelectric dams on the Panama river are now causing great friction between Brasilia and Buenos Aires.

An exacerbating factor in this rivalry has been Brazil's close identification with, and extensive aid to, the ruling military *junta* in Chile, a country with which Argentina has an active territorial dispute. Peru and Bolivia also both have major boundary disputes with Chile, and both fear Brazilian 'expansionism', so that there is even talk from time to time of a Peruvian–Bolivian–Argentine axis emerging to confront a Brazilian–Chilean axis. This does not seem likely in practice, however.

To cope with these not very imminent potential threats in its locality, Brazil simply pursues its traditional defensive strategy. This is made relatively easy because jungles, mountains and swamps, accessible only by a few large rivers and (on the Brazilian side) a few new roads, cover almost all of Brazil's frontiers with its neighbours. Only the southern borders, with Uruguay, Argentina and Paraguay, are relatively easy country for military operations, and close enough to Brazil's urban-industrial heartland, so it is not surprising that the Third Army Corps in the south is the biggest in Brazil. The largest concentration of air force strength is in the same region.

Brazil's defensive strategy was made necessary by the difficulty in concentrating military power quickly in any particular region of the country to repel invasion. This required that the army be carefully deployed within the country to cover a number of critical points (a distribution which also facilitated the army's anti-separatist and 'moderating' role). Since it was only where rivers crossed the Brazilian frontier that a serious invasion could take place, strategic defence requirements were met by the creation of a special command known as the Frontier Elements Group which, through units stationed at ports of river entry, controlled all movements in and out of the country via water transportation. The bulk of the army was based near the important coastal cities and industrial areas and adjacent to the southern borders with Uruguay and Argentina, with about 15% based in the 'hump' of the north-east in deference to anxieties about a threat to that strategically important region which controls the 'narrows' of the south Atlantic in a possible global confrontation.

In actual fact, the possibility of Brazil's becoming involved in international conflict within South America during the middle decades of the twentieth century was assessed as virtually nil even by Brazilian military planners themselves: while these deployments were (and still are) largely maintained, military attention was focussed at higher and lower levels, on World War II/cold war externally and on internal security at home. Now, however, the internal security threat seems

World Armies

decisively defeated and the Pax Americana extended by Washington over Latin America is becoming frayed at the edges: Brazilian like other South American generals again see serious wars within the continent as a contingency that must be planned for. Thus the strategic priorities of the Brazilian General Staff may now be stated to be the maintenance of a defensive shield around the Rio-São Paulo-Brasilia triangle, the ability to operate at sea throughout the south Atlantic, and a capability to operate on land and in the air throughout the River Plate basin.

A recent addition to this list is an ability to operate in the Surinam-French Guiana region in the period following withdrawal of the colonial power — a requirement justified by Brazil by reference to the possibility of a power vacuum in these underpopulated and underdeveloped neighbours which might attract Cuban or Soviet intervention, but seen with considerable suspicion in Venezuela as part of a Brazilian drive to gain access to the Caribbean.

In support of these strategic priorities the Brazilian armed forces have undergone an extensive modernisation programme in the past decade: the air force has acquired Mirage and F-5 supersonic fighters and the navy is receiving a considerable number of new warships to boost its anti-submarine and general warfare capabilities. Specific programmes which illustrate the growing regional emphasis of Brazilian strategic thinking include the acquisition of Roland surface-to-air missiles and Cobra ATGWs, the formation and equipment by the navy of a support brigade of marines complete with landing craft, and the formation in 1977 of a second parachute brigade of 7000 men which is theoretically capable of operating anywhere in South America within 12 hours.

Brazil's external commitments include membership in the United Nations, the Organization of American States, and its military counterpart, the Inter-American Defense Board. In practice its military activities abroad (with the exception of some army units with the United Nations Emergency Force at Suez and some air force elements with the UN force in the Congo in the 1960s) have been almost exclusively in association with the USA. This link extends back to the time of World War II, when Brazil joined the Allied war effort after German submarines had begun attacking Brazilian commercial vessels.

It had done the same thing for the same reason part of the way through World War I, and it was considered preferable in Washington that it restrict itself to the same kind of logistical contributions that it had made in the earlier conflict: collaboration of the Brazilian navy with Allied forces in the anti-submarine battle in the south Atlantic, the delivery of strategic minerals and other raw materials to Allied industry, and the granting of air and naval bases to the USA in north-eastern Brazil permitting United States forces to transit through Natal *en route* to Europe and Africa. Brazil provided all these services (and the Brazilian constitution still contains a duplicate of the clause that was then inserted permitting the president to authorise the basing or transit of foreign forces on Brazilian territory), but it also insisted on doing more.

In an early display of that determination to emerge from the regional into the world scene which has marked Brazil's armed forces in recent decades, they insisted on sending an expeditionary force to Europe. Washington, which had mixed feelings about the modernisation of Latin American armed forces, attempted to block Brazil's plans, and did succeed in limiting its contribution to one infantry division and one fighter group — about 25,000 men. They entered combat in mid-1944 in Italy as part of the United States Fifth Army, were in almost continuous action for over 200 days, and proved themselves able to meet the standards of European warfare. The Brazilian Expeditionary Force was not just the first and only military unit in history to leave South America to engage in combat in Europe; it also thereby made the Brazilian armed forces the only ones on the continent (except for a small Colombian contingent that fought in Korea) with any direct experience of modern warfare. It would not be excessive to say that the army's experience in Italy did more than anything else to mould both the international and the professional orientations of subsequent Brazilian senior officers down to the present.

Since 1945 the Brazilian armed forces have participated in frequent air and naval exercises with the USA and neighbouring countries in the south Atlantic, and in 1965 sent one of the first contingents to the Inter-American Peace Forces which intervened in the civil war in the Dominican Republic (the IAPF commander was a Brazilian officer). A close military association was developed with the USA, which sent a joint service mission to Brazil in 1948 to help establish the Superior War College that has since been the greatest single influence on senior officers' thinking. A full-scale American military mission was set up in Brazil in 1963, and between 1950 and 1970 United States grant aid to the Brazilian armed forces was \$217,700,000 plus a further \$27,600,000 worth of excess stocks.

Since the arrival in office of President Geisel in 1974, however, the once close links between Brasilia and Washington have been considerably loosened. In part this is a natural reaction to the fact that neither Brazil nor the USA is still in the militantly anti-communist frame of mind that helped to cement the alliance so closely during the Cold War. In part it derives from the exigencies of Brazil's ambitious economic growth plans, which absolutely require it to trade with anyone, regardless of ideology, and have made considerably sharper Brazilian resentments against the USA's trade policies. In the largest part, however, the estrangement of Washington and Brasilia is attributable to the growing divergence of interests and priorities as Brazil pursues its aim of becoming the local South American superpower, and an independent great power on the global stage.

The first clear signs of a new pragmatism in Brazilian foreign policy came in 1974, when General Geisel established diplomatic relations with Peking. In 1975 Brazil recognised the Marxist MPLA government in Angola several months before its final victory in the civil war there, and in the same year it voted for the UN resolution condemning Zionism as racism. These can all be seen as gestures intended to assist Brazil's export offensive in new markets, notably Africa and the Middle East, though they show a new willingness to ignore the USA's objections. The 1975 agreement between Brazil and

West Germany on nuclear co-operation, however, was an unmistakable gesture of total independence, for it involved — as Washington was well aware — the eventual creation in Brazil of an independent capacity to build nuclear weapons.

While the increasingly severe but unsuccessful pressure exerted by Washington on both Brasilia and Bonn to cancel this agreement was probably the main factor in alienating Brazil from the USA in the past few years, the final straw was the United States Senate requirement that its own State Department provide reports on human rights violations in each of the 80 countries that were receiving American military aid. When such a report on Brazil was duly furnished to the United States Congress in March, 1977 the Brazilian government formally renounced any further American military aid even before Congress had a chance to consider it. The sum involved was not large — some \$50,000,000 — and can easily enough be made up by Brazil, but the gesture was of prime importance in establishing that the old semi-paternal attitude of Washington towards Brazil was no longer acceptable. The two countries remain allies, but they now have a more distant and distinctly more turbulent relationship than at any time since 1945.

ORGANISATION

Arms of Service

Each of the three armed services operates as a separate agency within its own sphere of competence, but with common subordination to the authority of the president and the decisions of the National Security Council. The logistical procurement and distribution systems are also separate, and interservice rivalries and jealousies are considerable.

The minister for each armed force is appointed by the president and is invariably a major-general or vice-admiral; he exercises actual command over his service, and his office serves as general headquarters. The Minister of the Army is assisted in carrying out his duties by a secretariat, *ad hoc* commissions as necessary, and the Army General Staff sections. He also heads the High Command of the Army, a sort of army cabinet of political as well as military significance: it is made up of the Minister, the Chief of Staff, Ministry of the Army department heads, and the commanding generals of the four field armies (i.e. about 10 men). Meetings of the High Command generally occur monthly.

The Ministry of the Army is organised into five principal branches, grouping the Chief of Staff, High Command and Supreme Council of Comptrollership under the Elements of General Control; the Ordnance, Training and Research, Services, Personnel, and Engineering and Communications Departments under the Elements of Sectoral Control; the I, II, III and IV Armies, the Amazon Military Command and the Planalto Military Command under the Ground Forces; the Minister's Staff, the Secretary-General's Department, the Legal Advisor, the Public Relations Centre, the Intelligence Centre, and the Directorate of Finance and Accounting under the Administrative Directorates; and 28 other directorates under the Special Elements.

The army's combat forces are organised into eight divisions, each with up to four armoured, mechanised or motorised infantry brigades, plus three independent infantry brigades, five light 'jungle' infantry brigades and two parachute brigades. They contain the usual arms and services.

The navy, the senior service, is commanded by the Navy Minister, who heads a small staff for administrative matters, and six principal staff sections each commanded by an admiral. The Chief of the Navy General Staff is in the chain of command and is assisted by a Vice-Chief and departments of organisation, information, operations, logistics and communications. He also commands the directors of the Naval War College and the Navy Research Institute.

The other five principal staff sections are: the Commander of Naval Operations (who supervises the Commander-in-Chief of the Fleet), the Commandant of the Marine Corps and the commanders of the seven naval districts; the Secretary-General of the Navy (controlling the directors of naval administration, supply and general documents section); the Director-General of Naval Material (responsible for naval aeronautics, ordnance, communications and electronics, engineering and machinery); the Director-General of Naval Personnel (responsible for naval instruction, including the Naval Academy and the Almirante Wandenkolk Instruction Centre for non-commissioned officers, personnel matters, medicine and social security); and the Director-General of Navigation (responsible for navigation, hydrography and the operation of the ports). Each of the seven naval districts is under a commandant who has full command over the ships, forces, installations and personnel assigned to his territory, with the exception of specified ordnance and training centres.

The air force, made an independent service in 1943, is commanded by the Air Force Minister, assisted by an Air Cabinet for administrative and strategic planning functions and by the Air Chief of Staff and Air General Staff for operational control and direction. As in the navy, but unlike the army, the chain of command descends from the Minister through the Chief of Staff to the commanders of the major tactical units. The Air Cabinet consists of a chief (who is an air force general officer), a secretariat, and five sections responsible for study and information, public relations, administration, legal affairs, and congressional liaison.

The air force's combat elements are organised on a squadron basis, consisting of one interceptor, two fighter-ground attack, eight counter-insurgency, one ASW, one maritime reconnaissance, four search-and-rescue, 12 transport and three liaison squadrons. It also provides over 100 observation planes for army use and possesses large numbers of helicopters and trainers.

World Armies

Operational

Since 1953, and in accordance with a law passed in that year, the operational organisation of each of the Brazilian armed forces has been territorially based, the army being divided into four principal zones, the air force six and the navy seven.

The principal army organisations corresponding to these zones are the four numbered armies, with headquarters at Rio de Janeiro (Ist Army), São Paulo (IInd Army), Pôrto Alegre (IIIrd Army) and Recife (IVth Army). These zones are further divided into military regions whose boundaries are those of the State borders (though they may contain more than one State). The lightly populated north and north-west of the country do not fall under any of the numbered armies, but are controlled separately by the Amazon Military Command. Other special commands are the Brasília Military Command and the Frontier Elements Group (*see* Role, Commitment, Deployment and Recent Operations) which operates under IIIrd Army control.

There are 11 military regions (*Region Militar*), each consisting of one or several States and belonging to the following military commands:

Ist Army	1st RM: Espiritu Santo, Guanabara, Rio de Janeiro 4th RM: Minas Gerais
IInd Army	2nd RM: São Paulo 9th RM: Mato Grosso
IIIrd Army:	3rd RM: Rio Grande do Sul 5th RM: Paraná and Santa Catarina
IVth Army:	6th RM: Bahía and Sergipe 7th RM: Rio Grande do Norte, Paraíba, Pernambuco and Alagoas
Amazon Military Command:	8th RM: Acre, Amapá, Amazonas, Pará, Rondônia and Roraima 10th RH: Ceará, Maranhão and Piauí
Brasília Military Command:	11th RM: Brasília Federal District and Goiás

The IIIrd Army is the strongest in troops by a considerable margin; 1st and 3rd RMs have almost always been the military regions with the largest concentration of ground forces.

The Brazilian navy divides the country into six operational districts, each of which has a commandant exercising full command over the ships, forces, installations and personnel assigned to his territory. The headquarters of the Naval Districts are: First, Rio de Janeiro; Second, Salvador; Third, Recife; Fourth, Belém; Fifth, Florianópolis; and Sixth, São Paulo. The relatively new Seventh Naval District is in fact the Brasília Naval Command.

The main naval bases are the large complex in the Rio de Janeiro—Guanabara Bay area, and other large bases at Belém, Natal, Recife and Salvador. The navy also maintains a river base at Ladario near Corumba on the Paraguay River in southern Mato Grosso State, whose forces come under the operational control of the Frontier Elements Group.

The Fleet Air Arm, formed in 1965 after a lengthy interservice struggle with the air force, has its headquarters at São Pedro da Aldeia Naval Air Station. It only controls helicopters devoted to maritime warfare purposes, however; under the compromise imposed by Marshal Castelo Branco, the air force continues to operate all fixed-wing SAR, MR and ASW aircraft, including the squadron of S-2E Tracker ASW aircraft embarked aboard the navy's only aircraft carrier.

The Brazilian air force contains both regional and functional commands, each of which in varying degrees are superimposed on the basic squadron structure. The six Regional Air Commands (COMARs), with headquarters in parentheses, control the following areas:

1° COMAR (Belém):	Acre, Amapá, Amazonas, Pará, Rondônia and Roraima and the northern part of Mato Grosso
2° COMAR (Recife):	Alagoas, Bahía, Ceará, most of Maranhão, Pernambuco, Piauí, Rio Grande do Norte and the mid-Atlantic island territory of Fernando de Noronha
3° COMAR (Rio de Janeiro):	Rio de Janeiro and the larger part of Minas Gerais
4° COMAR (São Paulo):	São Paulo and the central and southern parts of Mato Grosso
5° COMAR (Pôrto Alegre):	Paraná, Rio Grande do Sul and Santa Catarina
6° COMAR (Brasília):	Brasília Federal District, Goiás, western Minas Gerais and a small part of Maranhão

While these COMARs provide the local support facilities for the air force's combat squadrons, however, they do not exercise full operational control over them. The three specialised commands which do so are the *Comando de Defesa Aerea* (Air Defence Command), the *Comando Aerotático* (Tactical Air Command) and the *Comando Costeiro* (Coastal Command).

The sole squadron under the control of the Air Defence Command is the *1ª Ala de Defesa Aerea (ALADA)*, based at Anápolis AFB some 80 miles south-west of Brasília. It is envisaged that the command should eventually possess a substantial interceptor force supported by SAM batteries in an integrated air-defence system, but at the moment the 1st ALADA is only of squadron strength, consisting of 15 Mirage III EBR and four two-seat Mirage IIIDBR interceptors (known as the F-103E and D, respectively, in the Brazilian air force). There is, however, a growing system of computerised air-traffic control and air-defence radars known as SISDACTA, installed under contract by the French Thomson-CSF Company, which in its present phase (DACTA II) covers all of south-eastern Brazil up to the cities of Brasília and Belo Horizonte. This network is under Air Defence Command control.

By far the largest combat command is Tactical Air Command, which controls the fighter-ground attack and counter-insurgency/reconnaissance squadrons. The most powerful of these are the *1ª* and *2ª Esquadrões* of *I Grupo de Aviação de Caça (GAvCa)*, based at Santa Cruz AFB near Rio de Janeiro and flying F-5E Tiger II supersonic fighter-ground attack aircraft. The other three fighter squadrons, the *1ª* and *2ª Esquadrões* of *IV GAvCa* at Fortaleza AFB in Ceará State and the *1ª Esquadrão* of *XIV GAvCa* at Canoas AFB near Pôrto Alegre, are equipped with Brazilian-made AT-26 Xavantes.

The counter-insurgency component of the Tactical Air Command consists of five *Esquadrões Mistos de Reconhecimento e Ataque* (Reconnaissance and Attack Squadrons): *1ª EMRA* at Belém and *2ª EMRA* at Recife, both flying the older T-25 Universal Is, and *3ª EMRA* at Galeão AFB near Rio de Janeiro, *4ª EMRA* at Cumbica AFB near São Paulo and *5ª EMRA* at Canoas AFB near Pôrto Alegre, all flying AT-26 Xavantes.

The *Comando Aerotático* also controls the three *Esquadrões de Ligação e Observação* (Liaison and Observation Squadrons), which operate a mix of light aircraft and helicopters with counter-insurgency capabilities. The *1ª ELO* at Campo dos Afonços near Rio de Janeiro operates the Neiva L-42 Regente, Bell 206A Jetrangers and Cessna 0-1E Bird Dogs; the *2ª ELO* at San Pedro de Aldeia flies Neiva T-25 Universal Is; and the *3ª ELO* at Pôrto Alegre has Bell UH-1H Iroquois, O-1E Bird Dogs and L-42 Regentes.

Coastal Command controls only two squadrons: the *2ª Esquadrão* of the *Grupo de Aviação Embarcada* (there is no 1st squadron), shore-based at Santa Cruz AFB near Rio de Janeiro, which flies the S-2E Trackers that operate from the navy's aircraft carrier; and the *1ª Esquadrão* of the *VII Grupo de Aviação* based at Salvador, which operates EMB-111Ms in a maritime reconnaissance role. There are plans, however, to expand the Coastal Command to at least four squadrons of EMB-111Ms (a maritime patrol derivative of the Bandeirante light transport) and one long-range maritime reconnaissance squadron flying an aircraft equivalent to the P-3E Orion by the early 1980s.

The other functional commands of the Brazilian air force are: the *Comando de Transportes Aéreos* (Air Transport Command), which exercises overall control over all air-transport elements (although these come under the direct command of the COMARs in which they are based); the *Comando Geral de Apoio*, responsible for repair, maintenance and storage depots; the *Comando Geral do Ar*, which supervises all ground staff, FAB troops, etc.; and the *Comando Geral de Pessoal*, responsible for personnel and general administrative matters.

The principal air bases of the Brazilian air force, other than those already mentioned, are at Balterra, Cachijo, Guarantingueta, Jacareacanga, Manaus, Natal and Santarém. These mainly house air-transport squadrons. In addition, however, there are approximately another 150 airfields and bases from which the Brazilian air force operates on a regular basis.

In the event of mobilisation, the principal reserve force available is the Military Police (also known as the State Militia). These forces are organised on a military basis, hold military titles, bear military weapons including automatic rifles and rocket launchers, and are commanded by an active-duty army officer. According to Decree Law No. 667 of July 2nd, 1969 they are under the operational control of the Ministry of the Army, with command channels extending from the Army General Staff through the numbered armies and special commands to the individual military regions embracing one or more States and territories.

RECRUITMENT, TRAINING AND RESERVES

According to the compulsory military service law of 1908, embodied in all successive constitutions, military service is obligatory for all Brazilian males between the ages of twenty-one and forty-five. They must report for examination at the age of eighteen, and serve 1 year on active service at the age of twenty-one. They then pass to the reserve of the army 'first line', in which they spend 8 years, followed by 14 years in the army 'second line'. There is a theoretical obligation for men in the reserve of the 'first line' to spend 2-4 weeks' training each year, and in order to qualify for public office a man must prove he is a reservist, has discharged his military obligation, or has been officially exempted.

The great majority of Brazilians, however, fall into the last category. Well over a million Brazilian males reach the age of twenty-one each year, and the armed forces' present requirement for conscripts is only 113,000. Even in the army, which takes all but 3000 of these conscripts, the proportion of regulars is almost 40% and has been steadily rising over time, while the number of conscripts accepted annually has been falling in absolute terms even as the armed forces expand. Thus, conscription is highly selective.

Conscript soldiers bear no distinguishing outward insignia, but within the armed forces they are regarded as transients, not quite equal to the long-service volunteers. Many are from deprived rural backgrounds, and are bereft of skills and often

World Armies

illiterate when they join the army. In addition to basic military skills, they are taught to read and write, when necessary, and often acquire simple industrially useful skills which will aid them on their return to civilian life.

The training of conscripts is primarily the responsibility of the commanders of the military regions containing the units to which they are assigned. In general, conscripts serve near their own municipality, and it is not unknown for them to be allowed to return to their homes for the evening or even for lunch in the latter stages of their training. The year of active duty is mostly devoted to training, in a series of instructional stages passing from school of the soldier to basic unit training, specialised weapons training and manoeuvres, which lasts 9 months. During the last 3 months the conscripts function as regular members of their units, but it is quite common for them to be discharged a month or two early. Most conscripts are from the poorer classes of society, and may indeed find the good, regular meals, decent accommodation and medical attention offered by the army superior to anything they have known in civilian life, so military service is not unpopular. Conscripts returning to civil life are guaranteed the right to return to their former employment.

As may be gathered from this account, conscription provides virtually none of the army's combat strength, and is primarily a means of training a large infantry reserve. Brazil's real armed forces are the approximately 160,000 regulars, all of them volunteers, and for them there exists an extensive and highly developed system of training establishments — by far the oldest and most sophisticated in Latin America.

Enlisted ranks in the regular army, after basic training, will attend courses at various points in their career at their relevant branch school, and at the Sergeant-at-Arms School if they rise to the higher non-commissioned ranks. Naval enlisted personnel begin training at one of the Seamen's Apprenticeship schools that operate at Fortaleza, Natal, Recife, Salvador, Vitória and Florianópolis, or if educationally qualified for petty officer rank will attend courses at the Admiral Tamandaré Instruction Centre in Natal or the Admiral Wandenkolk Instruction Centre in Rio de Janeiro between the ages of sixteen and nineteen. Air force personnel who rise to non-commissioned rank attend a variety of specialised courses at the Specialists' School at Guaratingueta in the State of São Paulo.

The educational system for army officers is one of the most comprehensive in the world. For over 90% of officers now serving it began with an army-supported military high school which they entered at the age of twelve (though as recently as World War II only 40% of army officers entered by this route). If they achieved an acceptable academic record on graduation, they then entered the Military Academy of Agulhas Negras (Black Needles), named after the black towers which dominate its entrance. This school is a lineal descendant of the Fortification School founded in Rio de Janeiro in 1699, later known as the Royal Military Academy, and undergoing several further changes of name and location before settling into its present name and location in Rio in 1951. Cadets attend the Academy for 4 years, taking the same subjects for the first two, then choosing their branch of the army and receiving special training in that branch during the final two, before graduating and receiving their commission. Medical officers receive their commissions by direct entry after graduation from civilian institutions, however, and need not attend the Military Academy.

Having commenced service with their units, junior officers must attend a course at the Officers' Improvement School during the next few years, and may also receive further specialised training at one of the branch schools: Engineers, Anti-aircraft, Coast Artillery, Communications, Material, Health, Veterinary Science and Physical Education. The major hurdle in any line officer's career, however, is gaining entrance to the 3 year General Staff College (*Escola de Comando e Estado Maior do Exército* — ECEME).

Admission to the ECEME is by competitive written examination, and the pass rate is generally less than one-quarter of the applicants. Not only is the ECEME the key institution in creating an *élite* identity in the Brazilian army's senior officer corps, but graduation from it is a formal prerequisite for promotion to the rank of general, for appointment to the teaching staff of any military school, or for service on the general staff of any senior command. It is a demanding and extremely wide-ranging course.

The summit of the military educational system (and the only level on which officers of all three services, plus civilians, attend the same institution) is the Superior War College (*Escola Superior de Guerra* — ESG), the so-called 'Sorbonne' of Brazil, founded in 1949. This institution, located in historic Fort São João in Rio de Janeiro, functions essentially as a postgraduate school for exceptionally promising general and field-grade officers of all three Brazilian services, under the direct control of the Armed Forces General Staff. Approximately half of its students are civilians prominent in industry, commerce, the professions, the civil service and politics, and its focus is on security policy at the highest level. It has been the principal source of the Brazilian officer corps' corporate view of its roles and responsibilities in the past two decades, and could be argued to be the most important political institution in Brazil. (See the note at the end of this section for further details on the curriculum and political significance of the ESG.)

Naval officers are educated at the Naval Academy on Villegaignan Island in Guanabara Bay, which is a descendant of the Royal Midshipman's Academy founded in 1808. The course consists of 4 years' academic work at the Academy and 1 year on a cruise ship, at the end of which the midshipmen receive their commissions. Officers subsequently attend courses at one of the series of specialist schools maintained for the various branches, and successful candidates will eventually proceed to a 9 month course at the Naval War College (equivalent to the Army Staff College). Classes are generally composed of about 60 officers, of whom two-thirds are line officers and the remainder from the Engineer, Supply, Medical and Marine Corps. Other officer schools are the Naval Research Institute, which co-ordinates and develops scientific and technological research of relevance to the navy, and the Aero-Naval Instruction and Training Centre, founded in 1955, which trains both naval and air force personnel for carrier-borne air operations.

There are two separate officers' educational systems in the air force, one for flying officers and the other for specialists. Flying personnel begin by attending the Air Cadets' Preparatory School at Barbacena in the State of Minas Gerais, where an average of 600 students receive training which leads to automatic entry into the Air Force Academy, the main institution providing flying officers to the Brazilian air force.

Non-flying specialist officers attend the Aeronautics School at Campo dos Afonços in Guanabara. They then proceed either to the Specialist Officers and Guards School at the Bacacheri Air Base in Curitiba, Paraná, where they are instructed in aircraft maintenance, armament, communications, photography, meteorology or supply, according to their speciality (and where air force infantrymen are trained in air-base guard and defence duties), or to the Aeronautical Technological Institute at São José dos Campos, São Paulo, where prospective aeronautical and electrical engineers undergo a 5 year course conducted on a high technical and scientific level.

At a later stage in their careers, air force officers will attend the Officers' Advanced Training School at São Paulo Air Force Base prior to achieving field-grade rank for instruction in command, leadership and administrative duties. If successful in competitive entrance examinations, flying, administrative and medical officers may subsequently attend the Command and Staff School in Guanabara. As in most air forces, general's rank is usually reserved for flying personnel. Air force generals, like navy admirals, will probably spend a year at the Superior War College.

In general it may be said that conscripts come from the working classes (most others being easily able to obtain the necessary exemption) and that most non-commissioned officers come from the middle classes, though a substantial proportion have working-class backgrounds. Before 1930 commissions were limited almost entirely to those of high birth, but increasing educational opportunities and the greater military emphasis on academic qualifications then led to progressively larger contingents of men of middle- and even working-class origins joining the officer corps. By the middle 1960s the army's officer corps was predominantly composed of men drawn from rural middle and lower-middle income groups, with a majority of them still coming (as was traditional) from outlying, less prosperous States or from the dynamic State of Rio Grande do Sul in the far south. Three of Brazil's four military presidents between 1964 and 1978 were from Rio Grande do Sul.

The consequences of this shift in terms of officers' social perspectives were less striking than might be imagined, however, for Brazilian officers are automatically accorded high social status regardless of previous origins. Any effects of this shift in the base of recruitment have been further attenuated by the growing trend towards the creation of a military caste in Brazil: whereas only 21% of cadets admitted to the Military Academy in 1941-3 came from military families, the proportion had climbed to 35% by 1962-6, and may now be even higher. It should also be observed that the navy is much more class- and race-conscious than the other Brazilian services; as late as 1962 the Naval Academy had graduated only a dozen mulattos and no negroes (in a country where these two groups comprise, respectively, about a quarter and a tenth of the population).

Conditions of service at all rank levels in the armed forces are favourable by comparison with the standards prevailing for civilians of similar experience and education. There is adequate food, accommodation and medical care even for conscripts. Base pay for regulars is not particularly high, but there are periodic salary increases for blocks of years of completed service, quarters, family and ration allowances, hazardous duty and hardship pay, and periodic cost-of-living increases which bring the total sum received by officers and NCOs to a level at least equal to that of their civilian counterparts. There has been no recourse to inflation of the rank structure in order to reward officers more lavishly — in 1964, the latest year for which a figure is available, fewer than 15% of Brazilian officers held colonel's or general's rank. Retirement pensions are relatively generous, and senior officers may also look forward to a smooth transition into well-paying jobs in government-owned industry or the private sector (in which they may well have accumulated considerable experience even when on active duty).

In view of the effort and expense devoted to training conscripts who immediately pass into the first-line reserve, it is surprising how little formal structure there is to the Brazilian reserve organisation. Potential officers are grouped into three classes: class one, those retired officers who are still capable of immediate command or staff duty when recalled; class two, those military officers who have retired early, officers on active duty with the State police forces, graduates of the officers' reserve training schools and sergeants in the reserve who have had at least 5 years' active duty service; class three, other civilians of good educational background. Similarly, there are three classes of potential enlisted personnel: class one, all men who have served on active duty, either as conscripts or reserves; class two, enlisted members of State police organisations, graduates of the reserve sergeants' school and all those who have completed military training courses in an authorised civic organisation; class three, all others under forty-five (the great majority) who received indefinite deferments of military service because they were in excess of requirements.

There is, however, no formal system of reserve military units, and only rarely are former conscripts required to do annual refresher courses. It seems probable that only a handful of recently retired officers, and the preceding two or three years' groups of conscripts, would be of any immediate use to the armed forces in the event of mobilisation. There is not, in any case, equipment available for more.

The more valuable and more readily available reserve for the army, at least in so far as internal security duties are concerned, is unquestionably the military police, also known as the State Militias. These forces, armed, organised and trained along military lines, are under the operational control of the Ministry of the Army, and number about 200,000-250,000 men. The police districts correspond to the military regions, and these forces offer the additional

World Armies

advantage that, much more than the army, their own numbers are greatest in the largest centres of population: in São Paulo they are 67,000 strong, in Minas Gerais 30,000, in Guanabara 24,000 and in Rio Grande do Sul 19,000. They are not equipped for full-scale war, but could readily relieve the army of all internal security responsibilities and free regular troops for war.

Note on the Superior War College

From the beginning of Brazilian independence, army officers have been more closely involved in the industrial and technological life of the country than in any other Latin American republic, since until 1874 the Military Academy was the nation's only source of both civil and military engineers. Even up to the 1920s the Academy was still training the majority of the country's engineers. The modern Brazilian officer corps' deep involvement in every facet of the country's political, economic and industrial activities, however, is a direct result of the doctrines formulated at the Superior War College (ESG).

There was probably a predisposition to political activism amongst its founders in 1949 in any case, since virtually all of them shared two key experiences: participation in the 1930 revolution, with its strong echoes of the social reformism of the Tenente rebellions of the 1920s; and experience of the Italian campaign in 1944–5, which whetted their desire to turn Brazil into a great power able to play an active role in global politics. At least as significant in moulding the ESG's perspectives, however, was the extremely large part in setting it up and guiding its early course that was played by the United States military advisory mission that arrived in Brazil in 1948 and remained until 1960.

By the mid-1950s, it seems clear, the influence of United States military doctrines and preoccupations had totally supplanted the previous French influence established by General Gamelin's mission between the two world wars. By that time, also, United States military missions in Latin America were turning increasingly to exporting new United States doctrines on the military's role in counter-insurgency, civic action and nation building, evolved in response to the revolutionary warfare techniques that were enjoying such success in China, Vietnam, Algeria and (ultimately) Cuba. Latin American armies were encouraged to study the social and political conditions which facilitated the growth of revolutionary protest, and to develop doctrines and techniques to prevent or crush such movements. Inevitably, they were drawn into consideration of how to alter those conditions — and the more professional the army, the more coherent and far-reaching would be its analysis of the existing internal situation.

In the highly professional Brazilian army, already committed to turning Brazil into a great power and tempted to help it along the path by direct intervention, these doctrines fell on fertile ground. The RSG began to develop a corporate view which directly linked national security (primarily from internal subversion) with national development, and accordingly to direct its attention to all the aspects of civilian policy-making which could affect such issues. During the 1950s, therefore, growing numbers of prominent civilians were invited to take part in the ESG's courses, and as early as 1959 the school's chief ideologue, Colonel Golbery do Couto e Silva, was arguing that the principal threat to Brazil's national security (the armed forces' responsibility) was not external aggression but 'limited warfare, localised conflict and above all indirect communist aggression, which capitalises on local discontents, the frustrations of misery and hunger, and just nationalist anxieties'. Thus the armed forces' main responsibility was to formulate a national security policy which would bring irresponsible politicians under control, foster rapid national development and impose a strong centralised discipline to avert revolutionary outbreaks.

The shift in Brazilian military perspectives and purposes can be measured in a number of ways. The curriculum of the ESG became ever broader, with the seven academic divisions devoted to: (1) political affairs; (2) psychological/social affairs; (3) economic affairs; (4) military affairs; (5) logistical and mobilisation affairs; (6) intelligence and counter-intelligence; and (7) doctrine and co-ordination. The proportion of civilians at the ESG, collaborating with the officers in studies of such varied topics as inflation, banking reform, agrarian problems, voting systems, transportation and education, as well as the more customary subjects like conventional and guerrilla warfare, swelled steadily, and created the nexus of contacts between like-minded soldiers and civilians which made possible the 1964 coup. By 1966, the ESG had graduated 599 military officers, but also 224 leading figures in private industry and commerce, 200 from government ministries, 97 from other government agencies, 39 Congressmen, 23 Federal or State Judges, and 107 other civilian professionals such as professors, economists, writers, doctors and priests. During the same period, even larger numbers of serving Brazilian officers were going into government ministries and national agencies devoted to industrial development on detached duty.

As late as 1960, it may be argued, this new national security perspective of the ESG, which automatically impelled its graduates towards taking charge of Brazil's chaotic economic, political and social life, was not shared by the army as a whole. By that time, however, the changed emphasis had already had its effect on the General Staff College (ECEME), which was and remains the principal vehicle for disseminating doctrine through the officer corps as a whole. In 1956 the ECEME curriculum contained no formal allocation of hours to the study of counter-insurgency warfare, internal security and communism; 10 years later, it devoted 222 hours to internal security, 129 hours to irregular warfare, and only 24 hours to the old professional preoccupation of conventional land warfare. Similarly, commencing in 1961 the *Boletim de Informações*, a newsletter distributed by the General Staff to key troop commanders, began systematically to disseminate the new ESG doctrines to all units.

With the passage of more than another decade, and the apparently decisive defeat of the guerrilla threat in the intervening period, the emphasis in the ECEME and ESG curricula is swinging back towards the more conventional military subjects, though there is no reduction in the stress placed on what other equivalent institutions would regard as the civilian subjects of economics, sociology and planning. The ESG remains the central institution providing theoretical direction to the Brazilian armed forces' drive to raise their nation to great-power status, and the meeting ground where the links between the soldiers and the civilian 'technocrats', who have jointly run Brazil for the past decade and a half, are forged.

The ideology and role of the ESG were summed up in 1976 by the then Chief of Staff of the Armed Forces, General Antonio Jorge Correa, at the ceremony marking the opening of its new academic year. 'Nothing', he said, 'will stop Brazil becoming a great power . . . It has to be remembered that ideal solutions, solutions that mark the destiny of great nations, appear as a result of difficulties.' The ESG was developing from 'a laboratory of ideas aimed at perfecting and strengthening national security' into an actual producer of solutions. The institute was producing an *élite* of military and civilians capable of running the country, and had already graduated some 3000 members of this *élite*.

EQUIPMENT AND ARMS INDUSTRY

The Brazilian army's main armoured strength consists of 60 M-4 medium tanks, and 220 M-3A1, 250 M-41 and 25 X-1 light tanks. This is supplemented by 120 Cascavel and M-8 armoured cars, and 600 M-113 and a substantial number of Urutu and M-59 APCs.

Its artillery strength is made up of 500 75 mm pack howitzers, 450 105 mm guns (including a considerable number of M-7 and M-108 self-propelled guns), and 90 155 mm howitzers. It also possesses ample supplies of 81 mm mortars, 108-R and 114 mm rocket launchers, and 106 mm recoilless rifles. It now has Cobra ATGWs, produced in Brazil under licence, and has 40 mm and 90 mm AA guns for air defence. Its 20 Roland SAMs, though mobile, are generally kept at Anápolis AFB near Brasília to protect Brazil's main interceptor force, the Mirage wing stationed there. Army aviation disposes of 40 L-42 Regente and O-1E light aircraft and 10 AB-206A helicopters.

Naval strength consists of: one ASW aircraft carrier, *Minas Gerais* (15,890 tons, ex-RN *Vengeance*); 18 destroyers (two with Exocet SSMs, Seacat SAMs and one Lynx helicopter; four with Ikara ASWs, Seacat SAMs and one Lynx helicopter; and two with Seacat SAMs); and 10 submarines (three new Oberon class and seven ex-United States Guppy II/III class). The navy also has 10 corvettes (fleet tugs), five river patrol ships, one river monitor, six large and 10 small river patrol craft, six coastal minesweepers, four coastal auxiliaries, four transports, two oilers, one repair ship, three floating docks, six survey ships, 11 survey launches, one submarine rescue ship, two LSTs and 25 small landing craft. The Naval Air Force, which by inter-service agreement is restricted to flying only helicopters, has one ASW squadron with five SH-3D Sea Kings (carrier-borne); one utility squadron with five Whirlwinds, two Bell 47Gs, 18 AB-206s, one FH-1100, six Wasps and nine Lynx helicopters (the latter mainly borne in destroyers); and one training squadron with 10 Hughes 269/300 helicopters.

The Brazilian air force has one interceptor squadron with 15 Mirage III EBRs and four Mirage III DBRs armed with R530 AAMs, and two fighter-ground attack squadrons with 34 F-5Es and five F-5Bs. The eight COIN/reconnaissance squadrons fly 39 AT-26 Xavantes, 20 T-25 Universal Is, and six UH-1D, four Bell 206 and four OH-6A helicopters.

The air force maintains one maritime reconnaissance squadron, equipped with 12 EMB-111Ms (a variant of the Bandeirante) and one ASW squadron equipped with eight S-2A and eight S-2E Trackers. Seven of the newer category are borne on the navy's aircraft carrier, while the S-2As they replaced are now used mainly for transport duties. Search and rescue is also an air force responsibility, fulfilled by four SAR squadrons with three RC-130E aircraft, 11 SA-16 Albatrosses and six PBY-5A amphibians, and five SH-1D, UH-1H and Bell 47G helicopters.

Given Brazil's huge distances and underdeveloped surface communications, a very large part of the air force's effort has to be devoted to tasks that elsewhere would be carried out by civil airlines or ground transport. This is reflected in its disproportionately large transport strength of 12 squadrons and 154 aircraft: two Boeing 737s, one Viscount, 10 C-130E/Hs, two KC-130Hs, nine HS-125s, 12 HS-748s, 21 DHC-5 Buffaloes, 86 EMB-110 Bandeirantes (56 of the C-95 variant, six R-95s, four EC-95s and 20 C-95As) and five EMB-121 Xingu aircraft, and six AB-206 helicopters. These transport squadrons are organised into: a group of C-130E/H transports and KC-130H tankers; a group of HS-748s and Bandeirantes; a squadron of HS-748s with large freight doors; a troop-carrier group with DHC-5 Buffaloes; a VIP transport group with the Boeing 737, Viscount, HS-125 and some Bandeirante aircraft and helicopters; and six independent squadrons with Bandeirantes and Buffaloes.

There are three liaison and observation squadrons equipped with L-42, T-25, O-1E and 10 EMB-810C (Seneca II) aircraft and UH-1H helicopters. Training aircraft include 100 T-23 Uirapurus, 130 T-25 Universal Is, 10 T-33s and 50 AT-26 Xavantes. All T-25 and AT-26 aircraft are capable of operating as armed COIN aircraft. The Brazilian air force operates over 600 aircraft of all types, of which 135 are normally configured as combat aircraft.

These are impressive armed forces in any case by Latin American standards, but the most noteworthy thing about the Brazilian forces' equipment is that at least 40% of their needs — unofficially estimated at \$300,000,000–\$350,000,000 a year — are now manufactured at home. Since the cancellation of the 25 year-old military assistance agreement with the USA in March, 1977 the Brazilians have placed even greater emphasis on producing their own weapons (with the help of

World Armies

licencing agreements, etc. where need be), and may soon be meeting above 75% of their requirements without suffering any severe penalty in terms of performance. Indeed, Brazil is now unquestionably the largest and most technically advanced arms producer in the third world, and in the past few years has even begun to appear in force in the military export market.

Brazil began modestly enough in the early 1960s by commencing production of a rifle under licence from the FNB Company of Belgium, the Italian Beretta pistol and a USA-patented heavy machine-gun, and by 1968 was meeting the army's requirements for cross-country vehicles from domestic production. In that year the army began a development plan for the construction of Brazilian-designed and produced armoured vehicles, floating bridges, rockets and rocket launchers, field radios and anti-tank missiles, while the navy launched a 10 year modernisation plan, now completed, which envisaged the development of naval ship-building capabilities in the Rio de Janeiro area to the point where they were able to produce modern destroyers at home. At the same time, the nascent Brazilian aircraft industry was offered strong government incentives to rapid growth. In 1970 the principal Brazilian aircraft company, Embraer, produced its first two aircraft, and in the following year the first prototype of the Brazilian-designed Cascavel armoured car was completed by the Engesa company.

Now all the items envisaged in the army's 1968 programme, and a great many other weapons, are being built in Brazil. Embraer's aircraft production in 1977 was just short of 700 planes, and the Brazilian air force's inventory of aircraft is over half home-produced. Engesa now produces a complete range of wheeled armoured vehicles, including amphibious APCs, and in 1977 secured export orders for more than 400 at a price of about \$400,000 each. The last two of a batch of six Vosper Thoneycroft-designed destroyers equipped with variable-depth sonar, ASW helicopters, surface-to-surface and surface-to-air missiles, were completed recently in Brazilian shipyards.

Many of the more sophisticated components must still be produced from foreign designs under licence, of course: Brazil is building Cobra anti-tank missiles and light automatic cannon in collaboration with West German groups, and heavy weapons in co-operation with Oto Melara of Italy. The Xavante ground-attack aircraft is a version of the MB-326 produced under licence from the Italian company of Aermacchi, the British Ferranti company has created a joint company with the Brazilian armed forces for the local manufacture of the Argus 700 (an advanced mini-computer used to control weapons systems) and negotiations with Aerospatiale of France for licence production of helicopters in Brazil have been reported. In many cases, it is still necessary to import entire sub-assemblies (including jet engines, some radars and sonars), but the rate of advance of the Brazilian armaments industry over the past decade has been little short of astonishing. A Brazilian-designed tank and a military-cum-civilian medium transport aircraft are now being contemplated.

A substantial portion of the arms industry is directly controlled by the armed forces. The navy runs its own shipyards and repair facilities, and the main naval shipyard in Guanabara Bay not only builds naval vessels but also accepts contracts for commercial vessels when capacity permits. The army maintains eight munitions factories — four in Rio de Janeiro and the rest in Minas Gerais, São Paulo and Paraná — and four arsenals, and is effectively self-sufficient in small arms and in all categories of ammunition, explosives and chemicals. The activities of these facilities, and the standards of civilian factories producing items for military use, are supervised by Imbel, a State-owned company established by presidential decree in 1975, and run by the Army Ministry. Imbel is also the main government instrument in seeking out (mostly Western European) arms producers interested in setting up joint ventures in Brazil, and in negotiating arms sales abroad.

The two giants of the Brazilian arms industry are Embraer and Engesa, both of which are located (together with many of Brazil's other private arms manufacturers) in the industrial city of São Jose dos Campos between São Paulo and Rio de Janeiro. In addition to building the Xavante and six other designs under licence, Embraer produces the very successful Bandeirante twin-turboprop transport and several other models of its own design for both military and civilian markets, and even produces assemblies for use in United States-produced combat aircraft like the F-5 Tiger II; it is the only non-United States company amongst the world's 10 biggest manufacturers in the 'general aviation' class. Engesa now has in series production: the EE-9 Cascavel, an armoured car of world-wide competitiveness which can be fitted with either a 20mm automatic cannon or a 90mm gun and carries 14 infantrymen; the EE-11 Urutu (a fully amphibious APC of sophisticated but rugged design); and the EE-17 Sucuri, armed with a 105mm gun firing fin-stabilised projectiles.

Nearby is the company of Avibras, specialising in the manufacture of solid-fuel artillery rockets for the Brazilian army — the 108-R, with a 7.5km range and 16.8kg launch weight, is already in service with the Brazilian army together with the associated X2 16 tube launcher designed for towing from any army vehicle including jeeps. Nearing series production are the X20 rocket (35kg warhead and 35km range) and a 3 round trailer/launcher, together with the X40 spin-stabilised battlefield support rocket (150kg warhead, 68km range) and a single-round trailer launcher, both of which have been extensively test-fired at the army's Marambaia Test Centre in Rio de Janeiro. There are proposals for even larger tactical rockets (the X300, for example, with a 1500kg warhead deliverable at ranges of about 350km), and a longer-range missile test site has been chosen in the north-eastern part of the country. Avibras is also reliably reported to be working on its own designs for air-to-air and surface-to-air missiles.

A large part of the strategy guiding the development of Brazil's arms industry is directed towards the creation of a military export sector catering primarily for the third world which will support the costs of domestic design and production. Early results have been good, since Brazil is able to offer technically satisfactory and robust weapons that are designed to withstand the harsh environmental conditions and indifferent maintenance which prevail in many third-world countries. Moreover, production costs are substantially lower than in high-wage industrial countries, and the Brazilian

armed forces' willingness to drop back in the delivery queue in order to allow arms producers to secure export orders permits Brazilian firms to offer unusually prompt delivery to foreign buyers.

The principal exporters so far have been Embraer and Engesa. Since the Embraer made its first military export sale of five Bandeirantes to Uruguay in 1975, it has sold six Bandeirantes and 11 EMB-111s (the maritime reconnaissance variant) to Chile; 10 Bandeirantes, 10 Xavante fighters and eight Uirapuru trainers to Paraguay; 12 Uirapurus and 18 Xavante fighters to Bolivia; and recently broke into the African market by selling six Xavantes to Togo and six Bandeirantes to Sudan. Engesa's armoured cars have proven extremely successful: after selling 30 Cascavels to Chile and 20 to Qatar in 1976, it secured an order for 400 Cascavels and Urutus from Libya in mid-1977. Imbel is also reported to have had discussions with delegations from Iraq, Turkey and Abu Dhabi regarding large purchases of Engesa-built armoured vehicles. Even the Brazilian navy finally entered the export market in July, 1977 accepting an order from the Chilean navy for 10 Brazilian-designed and built fast patrol boats.

It is likely that this export drive will continue and expand, providing a firmer base for Brazil's defence industry and thus bringing the goal of near self-sufficiency in arms closer within reach. It is plausible to suggest that within a decade nothing (with the possible exception of supersonic combat aircraft) will be outside the capabilities of the Brazilian defence industry.

Note on Nuclear Weapons Potential

The huge commercial deal between Brazil and West Germany in June, 1975 for the purchase of a complete 'nuclear fuel cycle' (uranium enrichment plant, eight 1100MW reactors and fuel reprocessing plant) has led to acute anxieties in Argentina and amongst those concerned to prevent nuclear proliferation elsewhere that Brazil has embarked on a course leading to the production of nuclear weapons. It was the first agreement ever for the wholesale transfer of an entire nuclear technology from one nation to another. In view of the extreme antagonism it aroused outside the two countries involved — the USA's attempts to persuade West Germany and Brazil to cancel the deal severely strained Washington's relations with both countries, and the Dutch government almost fell over its participation in the associated agreement by the URENCO consortium (Britain, the Netherlands and West Germany) to supply enriched uranium to Brazil until its own enrichment facilities are completed — it will probably be the last such deal. But the German nuclear industry faces a commercial collapse at home, and this huge export deal could well mean the difference between survival and bankruptcy, so the Bonn government has steadfastly supported its nuclear exporters despite all pressures.

While all aspects of the Brazilian-German nuclear programme have been made subject to the strictest International Atomic Energy Agency supervision by a 1976 agreement, the concern about possible Brazilian nuclear weapons continues unabated. Brazil has possible motives in its historical rivalry with Argentina, whose nuclear programme is much further advanced (the first Argentine power reactor went on stream in 1974, and the industry there is based largely on local technology and expertise). Both these countries, moreover, have refused to sign the Nuclear Non-Proliferation Treaty on the grounds that it is discriminatory. Brazil's sheer desire to possess all the appurtenances and prestige of a great power is seen as an additional motive. It is alleged with some truth that once the entire nuclear cycle, from mining uranium (of which Brazil has an ample supply) through enriching it, using it in nuclear power reactors, and finally reprocessing it to extract the potentially weapons-grade plutonium, is contained within the country, then deception of IAEA inspectors, or outright ejection of them and denunciation of IAEA controls, is a much greater possibility.

Thus international (not to mention Argentinian) concern has focused primarily on the enrichment and reprocessing plants, which do indeed indicate a determination to achieve nuclear self-sufficiency for whatever purposes. The parallel argument that Brazil has no economic need for so much nuclear power so soon, especially when it will prove to be more expensive than the hydroelectric power of which the country still has large untapped reserves, is however, less convincing. Even if the official forecasts that Brazilian energy requirements in the year 2000 will be between 180,000MW and 200,000MW (on the assumption that national energy consumption will continue to double every 7 years) should prove to be on the high side, the total exploitable hydroelectric potential of the country is probably only about 120,000MW — and a very large share of that is in the Amazon basin, at the other end of the country from the industrial areas where most of the demand is concentrated. Since Brazil is by far the poorest of the large continental countries in fossil fuel resources, it is calculated that nuclear energy will have to provide a rapidly growing share of electrical power after 1990 — the president of Nuclebras has suggested that it will need 75,000MW of installed nuclear power by the turn of the century, which is greater than the present nuclear power generating capacity of the USA.

The West German deal does fit in with these expectations — the first two 1300MW reactors, sited alongside Brazil's one existing 625MW Westinghouse-built reactor on Itaorna Beach at Angra dos Reis in Rio de Janeiro State, will probably not be ready until 1985 and 1987, while the remaining six reactors plus the enrichment and reprocessing plants will more likely come into service at the end of the 1980s and the beginning of the 1990s. Part of the agreement provides that the Brazilian share in the manufacture of reactor components should rise from 30% for the first two to about 85% for the final one, thus paving the way for a new generation of Brazilian-produced reactors in the 1990s.

A nuclear power programme of these dimensions does provide sound commercial and foreign exchange reasons for building one's own enrichment and reprocessing plants, although they are also the key to a possible nuclear weapons programme. It is very likely that Brazil's military leaders had in mind both independence from foreign sources of supply

World Armies

which might make them critically vulnerable to external pressures, and also a potential ability to build nuclear weapons, when they insisted that these ancillary facilities be included in any deal — and it was an absolute condition of any purchase, being indeed the main reason that Brasília chose West German suppliers over Americans who were legally unable to supply such plant. The remark made by the commanding general of the Brazilian First Army at the time the agreement was made in 1975, to the effect that it 'constitutes a decisive step that reinforces the country's sovereignty', predicting that Brazil 'would be transformed into a great power', undoubtedly does reflect the attitude of the Brazilian military leadership as a whole.

There is probably not, however, any intention on the part of Brazil to proceed to the production of nuclear weapons as soon as it becomes technically feasible in the late 1980s (and very probably of paying an extremely high price for thus violating the agreement to submit to IAEA inspection). Indeed, to evince any immediate interest in nuclear weapons would serve merely as a stimulus to the Argentine nuclear programme, which is currently years ahead of Brazilian capabilities. In so far as the agreement with West Germany on nuclear technology has a direct military significance for the present generation of Brazilian leaders, it is more that of discouraging the Argentinians from embarking on the development of nuclear weapons by demonstrating that Brazil can compete, and of achieving eventual nuclear technological parity with Argentina in order to afford themselves the option of making nuclear weapons rapidly in an emergency.

RANK, DRESS AND DISTINCTIONS

Ranks in the Brazilian armed forces are the same as those in the services of the USA, except that five-star air force and army general officers bear the title of marshal of the air force or army. Generally, however, these ranks are left vacant.

Insignia for army and air force general officers are from one to five silver stars worn on shoulder boards, ascending from one for brigadier-general to five for marshal. Field-grade army officers wear a combination of stars with sunbursts and plain five-pointed stars, worn without shoulder boards — colonels have three stars with sunbursts, lieutenant-colonels two with sunbursts and one plain and majors one with sunburst and two plain. Company-grade army officers wear plain stars — three for captain, two for first-lieutenant and one for second-lieutenant. Field- and company-grade air force officers wear the same arrangements of stars, but in place of sunbursts the stars are supported by varying numbers of gold metal bands. Naval officers' rank insignia is gold bands worn on the sleeve or on shoulder boards, the numbers of stripes being the same as in the United States Navy but the top band having a small loop as in the British Royal Navy.

All three services have a variety of uniforms including full dress, dress, service, and manoeuvre or fatigue uniforms. The army service uniform is dark green, the navy's is dark blue, and the air force's a lighter blue.

The principal decoration for bravery in the line of duty is the Combat Cross (*Cruz de Combate*), established in 1944 and awarded in two classes — gold and silver. The first class is awarded to individuals only, and the second may be awarded to members of a group or military unit. The Blood Cross of the Armed Forces, established in 1945, is awarded to military personnel for wounds received in military action. The Campaign Medal, created in 1944, was granted to military personnel for distinguished service in Europe in 1944–5.

There are also a number of medals awarded for non-combat achievements, of which the highest is the National Order of Merit Medal, established in 1946 for both military personnel and civilians of distinguished merit. There are five classes in this order (Grand Cross, Grand Officer, Commander, Officer and Knight), of which the highest is awarded to marshals, generals, their naval equivalents, and military officers who have completed 30 years of service. The Military Medal, established in 1901, is granted to officers of all services on the completion of each 10 year bracket of continuous service: bronze for 10 years; silver for twenty; gold for thirty; and a platinum clasp for forty. The War Services Medal, created in 1943, has a series of stars on the ribbon denoting the three classes: three stars, combat duty; two stars, patrol duty; and one star, base duty.

All three services have special achievement medals to be awarded to officers and men of their own branches for distinguished service and for excellence in service schools and academies. There are also a number of other medals which may be awarded to Brazilian service personnel, as well as to civilians, for distinguished service to the country in various fields.

CURRENT DEVELOPMENTS

The only major political division of opinion in the Brazilian officer corps of today, after two decades of ESG indoctrination and the post-1964 purges that removed some 20% of the officer corps for excessively democratic or leftist views, is between those who prefer to continue running Brazil publicly and those who would prefer to retire behind a tactical smokescreen of civilianisation and partial redemocratisation. Virtually all, however, are in agreement that their goal is to make Brazil a great power, and that that goal requires the armed forces to exercise at least a close supervision over the affairs of State.

So long as internal pressures do not become acute, it is likely that the officer corps will not choose to withdraw fully from its public politically directing role, though a further relaxation of the internal political controls may well occur. Active terrorism and organised subversive groups have been effectively removed from the scene, and there are no signs pointing to

their early revival. The past decade and a half, moreover, have seen the steady expansion of personal links and common interests amongst Brazilian senior officers, the civilian technocrats who administer the government on their behalf, and the rapidly growing industrial and commercial sectors of the economy. While prediction is risky, Brazil seems one of the less likely candidates for radical political change in the near future.

As regards purely military affairs, the slow but steady increase in the size and modernity of the Brazilian armed forces will probably continue, together with the rise of an independent Brazilian arms-producing and exporting industry. Despite chronic tensions with Argentina and the shadowy emerging outline of a Brazilian–Chilean axis opposed to an Argentinian–Peruvian one, the probability of open military conflict in South America remains low (though it has increased appreciably in the past decade). The persistent inter-service rivalry in the Brazilian armed forces will probably continue to block the creation of a unified Ministry of Defence, but the army's numerical preponderance allows it to exercise effective leadership and avoid damaging splits. The safest short-term prediction in the military field, as in the political field, therefore, is more of the same.

GWYNNE DYER

BRUNEI

Brunei, a sultanate on the northern coast of Borneo consisting of two nearby enclaves totalling 2226 square miles, is the only Asian equivalent to the oil-rich mini-States of the southern Persian Gulf. Its 170,000 people benefit from oil revenues that in 1977 amounted to almost \$900,000,000, and to defend this tempting wealth it maintains relatively large armed forces: 2750 troops of its own, plus a battalion of Gurkha troops on loan from Britain.

Internally the State functions as an absolute monarchy, ruled by the young Sultan Sir Hassanal Bolkiah Waddaullah, but Britain remains responsible for its defence and external relations. It has now been agreed with Britain, which had been exerting heavy pressure on the Sultan to break this link for a number of years, that it will become a fully independent State responsible for its own defence in December, 1983.

The Muslim sultanate of Brunei at one time ruled the greater part of the Borneo coast and even extended into the southern Philippines, but by the time Britain formally extended its protection over the State in 1888 successive concessions to the rajahs of Sarawak had reduced it to its present diminutive dimensions. It remained a backward and impoverished country until the discovery of the first oilfield in 1920, after which it rapidly rose in prosperity to become the richest State in Asia in terms of per capita national income.

Brunei failed to join the Federation of Malaysia when it was formed in 1963 because of the former sultan's insistence on retaining control of the oil revenues and his desire to be next in line for election to Malaysia's rotating Kingship (demands which Kuala Lumpur refused to grant). As a result, both segments of the State are entirely surrounded on the landward side by the Malaysian State of Sarawak. The political turbulence caused by the question of joining Malaysia was largely responsible for the State's one political upheaval, an abortive revolt by the now outlawed Parti Rakyat Brunei (Brunei People's Party) in 1962 which was suppressed with help from British troops.

Subsequent relations with Malaysia were cool but correct until 1973, when a group of political detainees belonging to the Brunei People's Party escaped from prison and were given political refuge in Malaysia. Following a period of acute political tension, relations with Malaysia were restored to a more normal tenor in 1977, but it is known that the Malaysian Foreign Ministry has been conducting delicate secret negotiations with Brunei in an attempt to persuade it to join the Malaysian Federation when British protection is finally withdrawn. Kuala Lumpur is anxious that an independent Brunei might be vulnerable to 'outside forces', especially in view of the autocratic system of government and the past history of attempted revolt, but there has been no indication that Brunei's ruler is partial to such a solution.

Indeed it is entirely clear that the Sultan's preference would have been for the indefinite continuation of the present arrangement whereby Britain takes responsibility for his defence and foreign relations. (The amended treaty governing this relationship was concluded in 1971.) Britain, however, has been eager to terminate this relationship for at least a decade, since it no longer maintains any other military outposts east of Suez except for Hong Kong, and since it is continually being upbraided by the United Nations decolonisation committee for holding Brunei as a colony.

Following talks in London in 1978, it was announced that the Sultanate would receive its full independence in 1983. It was also agreed that the British army's contribution to Brunei's defence, the battalion of Gurkhas stationed at the main oil town of Serai (whose costs are borne entirely by the Sultanate), would not be withdrawn until September, 1983. The Sultan is believed to be in direct negotiation with the government of Nepal to retain their services after that date, presumably under the command of contract officers.

Internally, the major preoccupation of the government is security, with approximately half the budget being devoted to the armed forces, the Royal Brunei Police, and the Department of Security and Intelligence. Expenditure on the armed forces in 1978 was \$Brunei 297,200,000 (\$US 128,700,000), a substantial increase from the defence budget of \$Brunei 235,000,000 in 1976, reflecting the urgent drive to expand and modernise the forces before the Gurkha battalion is removed.

The armed forces are known as the Royal Brunei Malay Regiment: all naval and air elements form part of the army. Ground forces consist of two infantry battalions (the second of which was only formed in 1975, and reached full strength in 1978), and one armoured reconnaissance squadron. There are plans to form a third battalion, but the fact that recruitment is voluntary and the acute manpower shortage in the state — it is estimated that the available military manpower pool is only about 4000 — mean that this is unlikely to be complete until well into the 1980s.

Army training, equipment, uniforms and rank structure all conform closely to British models, and most of the senior command positions are filled by some 60 expatriate British officers. The commanding officer of the RBMR is Colonel Norman Roberts. There is a substantial effort underway to train suitable Malay officers to replace the expatriates, and in 1977 there were almost 100 recruits undergoing training in Britain, but it is estimated that no indigenous personnel will be senior or experienced enough to take command of the regiment until 1984.

The naval and air elements of the RBMR comprise about 350 men, and ambitious expansion plans are being delayed by the shortage of trained pilots and naval officers. The naval element is based at Muara, the State's only commercial port; it is

envisaged that the air wing will eventually be based at the international airport near Bandar Seri Begawan, the capital.

The major weapons of the ground forces include 16 Scorpion light tanks, 24 Sankey APCs and 16 81 mm mortars. The navy has recently taken delivery of three missile-firing fast patrol boats, and also maintains six gunboats, 24 fast patrol craft, three river patrol boats and two landing craft. The air wing has one HS-748 transport, two Cherokee training aircraft, and three Bell 205, three Bell 206 and four Bell 212 helicopters; it is shortly to take delivery of three Defender COIN/transport aircraft from Britain. Brunei is also planning to buy a Rapier air-defence system from Britain for an estimated price of about \$60,000,000.

Paramilitary forces available to the government consists of the 1700-strong Royal Brunei Police. There is no organised reserve system. Pay, allowances and retirement benefits are generous, and conditions of service are good.

The transition to full independence and the withdrawal of the Gurkha battalion in 1983 are viewed with some trepidation by the government, but all visible indications are that the internal security situation is not threatening. The banned Parti Rakyat Brunei which led the 1962 revolt, and is still seen as the major threat, split in 1975, and Malaysia has recently been showing much less sympathy to refugees of that party. The RBMR, the police and the 235 man Department of Security and Intelligence present convincing obstacles to any attempt to overthrow the existing government which is based on purely internal support, but so long as the government fails to incorporate any representative element whatever, the possibility of internal trouble cannot be entirely discounted.

GWYNNE DYER

BULGARIA

HISTORY AND INTRODUCTION

The Bulgarian army is, in a sense, older than the Bulgarian state. The army can trace its origins back to the 'Bulgarian Legion' which fought with the Serbs against the Turks in 1862, although it was not until 1878 that Bulgaria gained autonomy. The history of Bulgaria has been marked by conflict. The Bulgarians defeated their traditional enemies, the Serbs, in 1885-6, and in 1912 joined the Balkan League's victorious campaign against Turkey. Bulgaria was defeated by Serbia the following year, but in 1915 she joined the central powers, occupied much Serbian territory, and managed to contain an Allied expeditionary force based on Salonika. Bulgaria was, however, eventually compelled to surrender, and the Treaty of Neuilly (1919) forced her to cede some of her territory to Yugoslavia and Greece.

In 1941 Bulgaria became an ally of the Axis powers, declaring war on the western Allies but not on the Soviet Union. The Germans used Bulgaria as a staging area for their invasion of Greece, but Bulgarian forces were not actually involved in the fighting. The Bulgarian army remained unengaged until September, 1944 when Soviet troops reached the borders of Bulgaria. The government rapidly capitulated, and Bulgarian forces thereafter fought against the Germans, under Soviet control.

The Fatherland Front, a communist-dominated coalition, had been formed in 1942, and it assumed power following the Soviet invasion. It won an overwhelming majority in the elections of October, 1946 and the Moscow-trained Bulgarian communist Georgi Dimitrov became Prime Minister as well as First Secretary of the Party. The constitutional monarchy had been ended following a referendum in September, 1946, although it was not until after the signing of a formal peace treaty in February, 1947 that Bulgaria officially became a communist State.

The Bulgarian army was thoroughly sovietised in the period 1944-51. Personnel of unreliable political views were purged, Bulgarian-born Soviet officers were moved into key appointments and 'deputy commanders' were introduced to act as political commissars. By 1951 the army had been thoroughly re-equipped with Soviet arms and equipment, and appeared to be a staunch and potentially effective Soviet ally. Although the Bulgarian army has now been outstripped in both size and combat potential by other Warsaw Pact armies, it remains a solid, if unsophisticated, force.

STRENGTH AND BUDGET

Population: 8,833,000

Army: 115,000

Navy: 8500; four submarines, 75 small craft

Air force: 25,000; 270 combat aircraft

Security Police and border guards: 28,000

GNP (1976 estimate): \$21,100,000,000

Defence expenditure (1976): \$537,000,000

COMMAND AND CONSTITUTIONAL STATUS

Command

In July, 1946 the government assumed collective authority over the army, largely in an effort to carry through its sovietisation policy. In practical terms, however, the Minister of National Defence, currently army General Dobri Djourov, is commander-in-chief of the armed forces. General Djourov's ministry in Sofia is organised on a similar pattern to its Polish counterpart. Bulgaria is divided into three military districts, commanded from Sofia in the west, Plovdiv in the centre and Sliven in the east.

Constitutional Status.

Bulgaria is a People's Republic, governed according to the Constitution of May, 1971. The National Assembly, elected every 5 years by all citizens over the age of eighteen, elects the State Council, the supreme organ of state power. The State Council's chairman, Todor Zhikov, is also First Secretary of the Communist party. The Council of Ministers, appointed by the National Assembly, is the supreme executive and administrative body. The National Assembly appoints and

dismisses the commander-in-chief, and the State Council gives general guidance for the country's defence and security; it also appoints and dismisses senior commanders. The constitution states that military service is compulsory for all male citizens.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role and Commitment

The army has the roles of national defence and the maintenance of the regime. Bulgaria is a member of the Warsaw Pact, and her forces would come under Warsaw Pact command in the event of major war.

Deployment

All Bulgarian forces are normally stationed within Bulgaria, although units as well as individuals go to the Soviet Union for training.

Recent Operations

Bulgarian forces participated in the invasion of Czechoslovakia in 1968.

ORGANISATION

Arms of Service

These are similar to those of the Soviet army.

Operational

The army contains eight motor rifle divisions and five tank brigades. Three of the former are little more than cadres, and all the latter are at about three-quarters of their full strength. One parachute regiment exists, but it is under air force command. It is interesting to note that the tank regiments are intended to operate with motor rifle formations: they would probably not be combined into tank divisions. Bulgaria is the only Warsaw Pact State to pursue this policy. Formations and units are organised on the Soviet pattern.

RECRUITMENT, TRAINING AND RESERVES

Recruitment and Training

All officers and the great majority of NCOs are professional. Conscription is for 2 years in the army and air force, and for 3 years in the navy. There is less emphasis on technical training than in the Soviet army, but training in general seems rigorous and effective. Bulgaria participates in large-scale Warsaw Pact Exercises.

Reserves

There are about 250,000 regular army reservists, and, in addition, a People's Militia of about 150,000. Students, workers and government officials receive part-time military and civil-defence training from the Voluntary Defence Organisation (DOSO), while pre-conscription military training is administered by the Dimitrov Young Communist League.

EQUIPMENT AND ARMS INDUSTRY

Equipment

Small arms: 9mm Makarov pistol; 7.62mm PPSH SMG; 7.62mm SKS automatic rifle; AK-47 assault rifle; 7.62mm RPK, RPD and RP-46 LMGs; 7.62mm M-49 MMG

Mortars: M-42 82mm and M-38 120mm mortars

Anti-tank: RPG-7 grenade launcher; 57mm M-43, 85mm M-45 and 100mm M-55 towed anti-tank guns; 82mm B-10 recoilless gun

Anti-aircraft: 23mm, 37mm, 57mm and 100mm anti-aircraft guns

World Armies

Artillery: 100mm M-44, 122mm M-55, 130mm M-54 and 152mm M-55 towed guns; BM-21 rocket launcher

Armour

Tanks: T-34/85 (about 150), T-54/55 and a few T-62s (1800)

Reconnaissance vehicles: PT-76 light tanks (250) and BRDM (250)

APCs: BTR-152, BTR-50, BTR-60 and OT-62 (2000)

SP gun: 100mm SU-100

Aircraft: MiG-17 (132), MiG-15 (24), MiG-19/21 (80+); An-24, Tu-134 and Il-14 transports ; Mi-4, Mi-2 and Mi-8 helicopters

Naval vessels: 4 submarines; 10 escorts; 3 Osa-class FPBs with Styx SSMs; 12 MTBs; 30 minesweepers and patrol craft; 20 landing craft

Missiles: Frog and Scud SSM (about 50); Sagger and Snapper ATGW; SA-2 Guideline SAM; SA-7 Grail SAM

Arms industry

Bulgaria relies almost entirely upon the import of arms and military equipment from the Soviet Union.

RANK, DRESS AND DISTINCTIONS

Rank

Badges of rank are worn on the shoulder-board, and are almost identical to those of the Soviet army. The Bulgarian army has, however, fewer ranks than its Soviet counterpart: the various ranks of marshal do not exist, and there are no ensigns. The Bulgarian *starschina* wears a broad braid 'T' on his epaulette, a badge now replaced by a broad braid stripe in the Soviet army.

Dress

Officers and soldiers in walking-out dress wear an olive-brown open-necked tunic and olive-brown trousers, black shoes and an olive-brown peaked cap with a red band. Shoulder-boards and collar-patches are in arm of service colours, and metal arm-of-service insignia are worn on the collar-patch. Working dress consists of an olive-brown tunic with a high collar, olive-brown trousers gathered by cloth anklets over black boots. Soldiers wear an olive-brown sidecap with a red star on the front and a national emblem on the left; officers wear a peaked cap. A long-skirted blouse is worn in summer. Combat dress is similar, and is worn with Soviet-style steel helmets and Soviet equipment. Tank suits and NBC protective clothing are also of Soviet pattern. Greatcoats and fur caps are worn in winter. The Dimitrov Mausoleum Guard, composed of specially selected conscripts, wears an elaborate ceremonial uniform based on a white hussar-style dolman in summer and a red dolman in winter.

Distinctions

Numerous orders and decorations are awarded by the Bulgarian People's Republic. The highest order is the Order of Georgi Dimitrov, awarded to Bulgarian soldiers and civilians as well as to foreigners.

CURRENT DEVELOPMENTS

The Bulgarian army undoubtedly lacks the technical sophistication of several other Warsaw Pact forces. It nevertheless possesses a wide range of well-tryed Soviet equipment, and seems to follow the Moscow line with greater enthusiasm than some of its allies.

RICHARD HOLMES

BURMA*

HISTORY AND INTRODUCTION

Burma was the first country of the British Commonwealth of Nations to leave the association on gaining independence, which it did in 1948, declaring itself at the same time a republic. The political leaders who won independence had first made their names and established their power as members of a nationalist military organisation, and Burma is today still led by one of those original 'thirty comrades'. Despite their success in winning independence from the British, however, their movement did not subsequently succeed in making itself acceptable to the heterogeneous population of the country as a whole, much of which is, and has been for many years, in open revolt against the central government. As a result, the army is continuously engaged in counter-insurgency operations in many of the 'minority' areas, and is indeed unable to penetrate some of the more remote frontier regions. The army is, however, more than a mere agent of political coercion. At the highest level, its leadership is indetical with that of the ruling Burma Socialist Programme Party and is committed to its one-party system of government and its policies of social and economic development and external non-alignment.

The modern Burmese army, unlike the Indian and Pakistani, is only tenuously descended from that of the colonial era. Until 1937, Burma, which Britain had annexed in successive stages between 1824 and 1886, was a dependency of the Indian Empire, garrisoned by a regiment of the Indian Army which, though called the 20th Burma Rifles, did not enlist Burmese proper†. Some Burmese were recruited into the Burmese Military Police, a paramilitary force, but they were outnumbered by Indians and Gurkhas and by representatives of the Burman minorities — Karens, Kachins and Chins — who also supplied the bulk of the Burma Rifles. At the approach of World War II, the Burma Rifles was expanded from four to 14 battalions, but the proportion of Burmese enlisted did not increase.

Most of these hastily-raised and undertrained battalions melted away during the British retreat from Burma in the face of the Japanese invasion in 1942. Only one, the 2nd Burma Rifles, kept together, and into it were drafted the survivors of the rest, most of them Karens of the Irrawaddy delta, about 1000 in number. The battalion fought throughout the rest of the Burma campaign and played a particularly useful reconnaissance role during the two Chindit operations behind Japanese lines.

In terms of numbers, and of future political and military significance, however, the most important group of Burmese soldiers served on the other side from the British during most of the war years. This was the Burma National Army, raised by Burmese patriots, under Japanese patronage, with the aim of bringing their country to independence. Its leaders, as self-styled *Thakins* (masters), had cut their political teeth in pre-war university and parliamentary nationalist agitation, through which they attracted the attention of a Japanese agent who arranged, in early 1941, for 30 of them to visit Japan for military training. Their leader, Aung San, had already been there on a preliminary visit and on their joint return he became head of a clandestine Burma Independence Army. It actually took part, at the side of the Japanese, in the expulsion of the British from the country in 1942, but its military value was low and was quite offset by the unrest its subsequent oppression of the minorities within the country caused. In July, 1942 it was disbanded by Japanese order. The Japanese had nevertheless decided to vest the government of the country in the nationalist movement, and in August conferred power on a group which included Aung San. He was allowed to re-raise a military force, which was called first the Burma Defence Army and then the Burma National Army, and employed to maintain internal security — a necessary duty in view of the disaffection of the minorities, which the British successfully fostered. It grew eventually to a size of nine battalions, and even took a minor part in operations against the British; but worsening relations with the Japanese, who mistreated its personnel and frustrated Aung San's efforts to build it into an independent national force, prompted him to make contact with the British and arrange for it to change sides at a convenient moment. This it did on their approach towards Rangoon in March, 1945.

The BNA and its leaders thus ended the war on the winning side, under the new title of Patriotic Burmese Forces (PBF). It quickly moved into an even more advantageous position within the country. While the British garrison was progressively withdrawn for demobilisation, former BNA troops were recruited in sizeable numbers into the new Burmese Regular Army, and into the reorganised Military Police. The principle of enlistment which Aung San forced the British to concede was by 'class', so that while battalions of Karen, Kachin and Chin Rifles were separately established, in recognition of their wartime service, five new wholly Burmese battalions (1st and 3rd–6th) of the Burma Rifles were also created, as well as several wholly Burmese battalions of the Military Police. The majority of the Burmese recruits into both were former members or supporters of the BNA, and the surplus were directed by Aung San into a private army of his political

* See also Appendix 1.

† 'Burmese' is commonly used to signify the Burmese-speaking majority, 'Burman' the whole indigenous population, which includes several large minorities of mainly hill-dwelling people — Shans, Kachins, Karens, Chins, Mons, Arakanese — as well as many small tribal groups.

World Armies

party, the Anti-Fascist People's Freedom League, known as the People's Volunteer Organisation. It soon had branches in every district and town and, with an AFPFL network within the public services, provided the movement virtually with a parallel authority within the State.

Open conflict between the government and the AFPFL over the timing and conditions of independence — the principle of which the British conceded — had been certain since the reinstatement of the colonial regime. It was precipitated spontaneously by a police strike, over a mundane but pressing issue of pay, in September, 1946 which the AFPFL, seeing their opportunity, turned into a general strike. Lacking the means to maintain order, and with the PVO drilling in the streets, the British governor invited Aung San to head a new Executive Council, formed largely of AFPFL members. Aung San accepted and almost immediately demanded the grant of full independence under the threat of rebellion. In January, 1947 he was promised that it would come into effect within 1 year.

The British acted apparently in the belief that the minorities, about 30% of the population, would accept the legitimacy of a unitary State, and that Aung San was undisputed leader of the nationalist movement. Neither belief, as the British were well aware, was sound. The Burmese communists, who had been purged from the AFPFL, were in open rebellion, and were themselves split into a Red Flag (Trotskyite) and White Flag (Stalinist) group, while still inside the movement were many rivals for Aung San's position, notably U Saw, a pre-war prime minister. In the population at large, the minorities remained deeply suspicious of Burmese intentions, and were adamant for local autonomy and the entrenchment of the right of secession.

By a remarkable effort of personal diplomacy, Aung San managed to reconcile all the hill-people, except the Karens, to his independence scheme, which would have allowed them a measure of autonomy, and, with that success behind him, went on to sweep the polls at the election for the Constituent Assembly in April, 1947. Three months later, however, at one of the first constituent cabinets, henchmen of U Saw broke into the meeting and machine-gunned to death most of those present, including Aung San. They, including U Saw, were executed soon after. But the death of *Bogyoke* ('the great general' as he continues to be known in Burma) robbed the country of its chance of a smooth transition to independence. His successor, U Nu, though a senior Thakin, lacked his popularity and authority and was faced from the outset by rebellion. At first it was offered mainly by the Red Flag communists and by the Muslim *Mujahids* of the north Arakan, but within 6 months they had been joined by White Flag communists, much of the PVO, some ex-BNA battalions of the regular army and the Union Military Police, some of the 1st Kachin Rifles and, among the other minorities, the Karen National Defence Organisation and the Mon National Defence Organisation. By March, 1949 15 months after independence, full-scale war was raging over the greater part of the country and, with the exception of Rangoon, all the important towns were in rebel hands.

Fortunately the rebels were quite disunited and, indeed, in most cases mutually antagonistic. Even more fortunately, and very creditably, most of the Karen, Chin and Kachin battalions remained loyal, even though called on to fight their own people, and despite the example of the bulk of the Burmese battalions that defected to the communists in July–August, 1948. Through their efforts (and despite the mutiny in February, 1949 of the hitherto loyal Karen battalions) the government held on and by November, 1949 had wrested the initiative from its enemies. About that time their number was swelled by the appearance of a refugee army of Nationalist Chinese inside the eastern Shan States but these 'KMTs' (*Kuomintang*) constituted a problem which could be temporarily shelved and dealt with separately. Against the insurgents proper, the Burmese army pressed forward to recover half the territory of the State, and most of the important towns, by the end of 1950. It grew greatly in strength, from 9 to 41 battalions, between 1952 and 1953, and by the end of 1954 had virtually destroyed the Karen National Defence Organisation and the *Mujahids*, and had greatly reduced the numbers of the White and Red Flag communists and their allies the PVO mutineers. It was also able to deal severely, in 1953–4, with the KMTs, even though they had recruited numbers of Shans and had apparently been reinforced directly from Taiwan.

The very military success of the government in the regions produced, however, grave political problems at the centre. The absence of a parliamentary opposition, which is what the rebels would have provided had they not taken to the jungle, encouraged faction fighting in the AFPFL, which by 1958 had gone as far as the creation of new private armies, financed by the proceeds of corruption which was rife in the party's ranks. 'The situation was closely approaching the sad spectacle of 1948–9', warned the Commander-in-Chief, General Ne Win, in a speech to parliament, and the only solution to it, in the judgement of wide sections of opinion, was to confer power temporarily on the army. The view was shared by U Nu who on October 26th, 1958 requested Ne Win to take office, with powers to restore order sufficiently for new and free elections to be held.

During the following 15 months the army set itself three tasks: to re-establish peace and the rule of law; to implant democracy; and to establish a socialist economy. To that end young officers were introduced into most public agencies, the police strengthened, the counter-insurgency prosecuted more vigorously, squatters resettled, and public corruption severely punished. While it does not seem that much progress was made with any but its first task, the army nevertheless proceeded to sponsor the promised election, a year later than originally scheduled, in February, 1960. The electorate returned U Nu's branch (now non-socialist) of the AFPFL by a large majority and the army returned to barracks, or rather to the full-time prosecution of the war in the provinces.

U Nu's rejection of socialism, though it had won him temporary popularity by making his wing of the AFPFL seem a new — and therefore perhaps uncorrupt — party, failed, however, to win stability for his government. To gain new supporters, he had given promises, particularly to the Buddhists, which he proved unable to keep. He had also offered the

minorities, particularly the Shans, increased autonomy and, when he seemed about to allow them to secede (as the Constitution strictly allowed them to do), the army once more intervened, this time on its own initiative. On March 2nd, 1962, the Rangoon garrison, under the orders of Ne Win, occupied the government buildings and installed a military cabinet in power.

The precipitating cause of the coup was probably the desire to preserve national unity, of which the army, like that of so many other countries, regarded itself as the fundamental guardian. But there were other reasons for the army's decision to seize power. One was a widespread contempt for the politicians and their parties — similar to that which had prompted Ayub Khan to stage his coup in Pakistan in 1958. But, paradoxically, the failure of these socialist parties to make good their programmes had generated a popular desire for more, not less, socialism and, because of its roots in the pre-war nationalist struggle, the army's leadership also saw itself as guardians of the purity of 'Burmese socialism'. As a result, the regime of which Ne Win became the head more closely resembled that of Nasser's Egypt than those military regimes which came to power elsewhere in Asia in the same years.

It differed from the Nasserite model, however, in constituting itself as a political *corps d'élite* rather than as the spearhead of a mass movement. The military leadership constituted itself a Revolutionary Council on taking power, dissolved parliament, and disbanded the political parties (March 28th, 1964), having meanwhile created its own Burma Socialist Programme Party. Entry to that party was made, however, deliberately difficult and its membership, even today, does not seem to extend far beyond the upper ranks of the army and the administration* (which in many cases are co-terminous). Admission requires the assent of the Revolutionary Council and members are obliged 'to accept out of conviction *The Burmese Way to Socialism*', a fairly orthodox statement of Marxist belief which the Council published in April, 1962 as its party creed. In some sense, therefore, the BSPP may be seen as a Leninist revolutionary cadre rather than as a ruling political party.

Yet the party does rule and in the years between 1962 and 1972 did so in a very direct manner. The revision of the Constitution, undertaken by a mixed military-civilian committee between 1971 and 1973, has replaced direct rule with a more representative form, but the personnel has not changed and effective power rests where it did before, among the leadership of the armed forces. The political and economic consequences for Burma of so many years of Marxist-military government have not been happy. The economy, which has been progressively nationalised, is stagnant and the fundamental political problems, which require a federal solution, have not been tackled at root. As a military body, however, the rank and file of the army remain efficient and well-motivated and their purely military achievements against the rebels in recent years have been considerable. Rebellion is now almost exclusively confined to the border areas and the number of active dissidents has been reduced to an easily manageable figure (perhaps 15,000). Having preserved the unity of the country, and largely restored law and order, the next task of the army will be progressively to shed its power and inaugurate an era of permanent civilian administration.

STRENGTH AND BUDGET

Population: 32,445,000 (of which 30% are non-Burmese minorities)
 Army: 153,000
 Navy: 9000 (two frigates, 79 small craft)
 Air force: 7500 (25 combat aircraft)
 Paramilitary: 38,000 paramilitary police; 35,000 militia
 GNP (1975): \$2,700,000,000
 Defence expenditure (1976): \$113,000,000

COMMAND AND CONSTITUTIONAL STATUS

The 1974 Constitution, which restored a measure of representative government after 12 years of government by decree, transferred power from the Revolutionary Council — set up by the coup of 1962 — to a one party (Burma Socialist Programme Party) civilian government. The membership of the new Council of Ministers is close to that of the former Revolutionary Council, whose military members — the large majority — had dropped their ranks in 1972. Real political power, as well as control of the armed forces, remains in the hands of the President, ex-General Ne Win, and his close supporters, most of them ex-officers. He is empowered, by virtue of emergency provisions embodied in the new Constitution of December, 1973 (the product of a national referendum) to employ the army in virtually any situation and any guise he chooses. Its officers are deeply involved in politics and in many cases are elected members of the government. Party influence permeates throughout the army, though the creation of a 'commissar' system has been avoided; instead, commanding officers act as both military and party chiefs within their own units, and are promoted on the basis of professional competence and party loyalty in equal measure.

* In 1973 President Ne Win declared his intention of transforming the BSPP into a mass movement, the People's Party.

World Armies

The supreme governing and policy-making body is the Council of State, which is chosen by the People's Assembly (first elections to which took place in January, 1974). The Chairman, ex-General Ne Win, is also *ex officio* President of Burma. The Council's defence powers, which require endorsement by the People's Assembly, include the declaration of martial law, states of emergency and mobilisation.

The supreme executive body is the Council of Ministers, which implements the orders of the Council of State and resolutions of the People's Assembly. Specifically, it is charged with the management of national defence, maintenance of law and order and the budget. Ministers and their deputies may be serving officers; officers elected to the Council of State, however, must retire from the service.

The head of the defence organisation is the Minister of Defence, who also acts as Chief of Staff of the defence forces. The Defence Ministry is a joint integrated headquarters, exercising complete political, operational, financial and administrative control over the forces and the defence industries. There are Vice-Chiefs of Staff for each of the three services but, although the navy and air force have responsibility for their own operations and training, their influence within the defence organisation is slight. The army dominates by virtue of its much greater size.

ROLE, DEPLOYMENT, COMMITMENT AND RECENT OPERATIONS

Role

Because of Burma's unaligned foreign policy, external defence is not a major preoccupation of the Burmese army. India and Thailand are benevolent neighbours, Laos has internal problems and China, though having cause for disagreement on a number of issues, some now settled, some still outstanding, in practice chooses to maintain good relations.

The maintenance of internal security is thus the army's principal task, but it is not discharged in a purely military way. During the Revolutionary Council period, 1962–74, the administrative machinery of Burma proper at division, district, sub-division, township and village levels was organised in Security and Administration Committees, the chairmen of which, except at village level, were serving officers, who were also either commanders of units operating within the area or in close liaison with them. The administration in the States (Karen, Kayah, Kachin and Shan, and the special division of the Chins) was differently organised, for historical reasons, but was also strongly military. Since the reintroduction of a nominally civilian government in 1974 these arrangements have been modified, but the administration remains, nevertheless, under close military supervision. The commanders of the nine regional commands, in particular, wield great power.

Deployment

Units are deployed under nine regional commands, the boundaries of which correspond exactly or approximately with those of the seven divisions of the States. Each command has at its disposal one to three Tactical Operation Commands (TOCs), equivalent to a brigade, containing three to four infantry battalions. They are deployed as follows:

Regional command	Division or State	Numbers of TOCs
North-west	Special Division of the Chins, Magwe (northern), Mandalay (northern), Sagaing (southern)	Two
Western	Arakan, Magwe (southern)	One
Central	Mandalay (southern), Pegu (northern)	One
South-west	Irrawaddy	Two
Rangoon	Pegu (southern)	—
Northern	Sagaing (northern), Kachin	Two
North-east	Shan (northern), North-east Special District*	Two
Eastern	Shan (southern), Kayah	Three
South-east	Karen, Tenasserim	Three

* East of the Salween river; the army does not operate in this area.

In addition, the Ministry of Defence disposes of three divisions, numbered 77, 88 and 99, each fielding three TOCs and comprising 10 infantry battalions, which are allotted as necessary to the regional commands. All are at present deployed in the eastern hills.

Commitment

Burma has no military treaty with any other State and does not allow foreign troops to enter her territory (though Chinese troops may have tacitly been allowed to operate against the KMTs in 1961–2). Aid and advice have been received intermittently from the British, Yugoslavs, Russians and Chinese, but the policy of the army is to rely on its own training resources and to procure arms from abroad, if that is necessary, by cash purchase.

Recent Operations

'Recent operations' merge imperceptibly with 'past operations' in Burma, for the rebellions with which the army is continuously occupied have been running uninterruptedly since independence and have their origins in the ethnic and political character of the country. The dissident groups are fewer today than in 1948, but those which survive were active then, if under a different name or names, and are still devoted to aims declared at that time. They fall into three categories: (1) the communists, whose quarrel with the government is ideological (though historically also personal) and who now operate in the Shan States on the Chinese border. Formerly split into White Flag (Stalinist) and Red Flag (Trotskyist) wings, the latter were effectively destroyed by the capture of their leader, Thakin Soe, in 1970. The White Flags, who had long operated in Arakan, Pegu and the Irrawaddy delta, concentrated their activity in the Shan States in 1968, following the assassination of their leader, and in order to enjoy readier access to the aid which the Chinese surreptitiously give them. They number between 3000 and 6000 and have an alliance of convenience with the Shan and Kachin rebels. (2) The dissidents among the minorities, mainly Shans, Mons, Karens, Kachins, Chins and Arakanese. Each group desires autonomy for its own region, but they are disunited (although short-lived alliances have been formed: the most recent is the National Democratic United Front, to which the communists have made overtures). The most important groups are: the Karen National Unity Party, the New Mon State Party, the Karen National Defence Organisation, the Chin National Organisation, the Arakan Liberation Party, the Kachin Independence Army (about 4000 fighters) and the Shan State Army (about 4000 fighters). A group of dissident Burmese exiles, founded by U Nu in 1969 and based originally in Thailand, called the Parliamentary Democracy Party, is also sporadically active. (3) The Kuomintang (KMT), whose presence on Burmese soil owes nothing to internal causes. They are a remnant of Chiang Kai-shek's army which made its way into eastern Burma after the Communist victory in 1949, and are now principally engaged in the opium trade, though they commit the occasional 'political' act and remain in contact with the Taiwan government.

The army can claim a considerable degree of success against the rebels in recent years, particularly over the communists in Pegu in 1968–72, but this must be measured against a marked upsurge of rebel activity in the mid-1960s, brought about by Ne Win's policy of centralism. The rebels remain strong and popular enough in their own areas to stage quite spectacular attacks on government forces. The most serious in recent years have been the seizure of the town of Mong Mah in Shan State near the Chinese border by 4000 communists in November, 1973 who were dislodged only by a fierce counter-attack supported by aircraft, and the seizure of the town of Myawaddy in March, 1974 by 2000 Karens. They kept 150 government troops surrounded for 5 days until they were released by a force of 2000 soldiers supported by aircraft. Government interference with the opium trade, on which all dissident groups depend for income, also frequently leads to fighting, as with the quite unpolitical Lah tribesmen of the Thai borderland in January, 1973. Student disorders and industrial strikes, caused by economic grievances, also required the intervention of the army in several large towns in 1974.

ORGANISATION

Arms of Service

The army contains, as well as ordnance, service, medical and military police corps units, small signal and engineer units, five field artillery regiments, one anti-aircraft regiment, and two armoured regiments (one tank and one armoured car) both with obsolete (and in the case of the tanks, antiquated) equipment. It is, however, overwhelmingly an infantry force, which has retained something of a 'regimental' system deriving originally from the British. The regiments are: Burma Regiment, 89 battalions; Burma Rifles, six battalions; Kachin Rifles, five battalions; Chin Rifles, four battalions; Shan Rifles, one battalion; Kayah Rifles, one battalion; and Light Infantry Regiment, nine battalions. Official policy is to reduce the regiments recruited on an ethnic basis, and to man all units with a mixture of people. Thus the government has consistently refused Arakanese requests for the formation of an Arakan regiment. However, many battalions are still recruited from a single people only, and this is also true of battalions of the all-Union Burma Regiment, some of which, for example, are exclusively composed of domiciled Gurkhas (numbers of whom are settled in the Kachin and Shan States).

Operational

A battalion is organised into four rifle companies of three platoons, plus a support company with mortar, machine-gun and recoilless rifle platoons, and an administrative company. The establishment is 27 officers and 723 other ranks but the normal strength is about 500. Three or four battalions form a Tactical Operations Command; three TOCs form a division. Artillery and armoured units are deployed only as required.

RECRUITMENT, TRAINING AND RESERVES

Military service is voluntary. Pay is not now higher than in comparable civil employment, but the perquisites offered by the army — free rations, clothing, accommodation and medical care — raise the military standard of living higher than the

World Armies

civilian. There is therefore little difficulty in recruiting either officers or men. The recruitment policy is to man all units on a mixed-race basis, but numbers are still recruited from a single minority.

Officer training is conducted at the Defence Services Academy, Maymyo, near Mandalay, founded in 1955. It is a tri-service school, at which the cadets complete a four-year degree course and are indoctrinated for membership of the Burma Socialist Programme Party. An Officer Training School commissions university graduates after a four-month course and selected serving soldiers after 18 months. The superior training of officers is conducted at the Command and General Staff College, an eight-month course, and the National Defence College, Rangoon.

Soldiers are trained in their unit depots; non-commissioned officers are trained at the Non-Commissioned Officers School; the various corps — Artillery, Armour, Signals — maintain schools of technical training.

There are virtually no reserves for the army. The Territorials (*sitwundans*) founded at independence and numbering originally about 14 battalions have gradually been absorbed into the regular army. The other forces — *kins* (village home guards) and the Special Police Reserve — are local part-time organisations.

EQUIPMENT AND ARMS INDUSTRY

Equipment is largely of British and American pattern and is mostly obsolete, but some is gradually being replaced by locally manufactured light arms and small quantities of heavy weapons from abroad. Burmese government policy is to purchase foreign equipment, rather than seek gifts, in accordance with its foreign policy of non-alignment. The local arms industry is of recent foundation and limited scope and output, but the country is believed to be self-sufficient in small arms ammunition.

Apart from old patterns of small arms, the most important types of weapons are believed to be as follows:

Rifle: 7.62mm G3 (German; Burmese made)

Light machine-gun: 7.62mm G4 (German; Burmese made)

Grenade launcher: 40mm M79 (USA)

Mortar:

light: types unknown

heavy: 120mm Soltam (Israel)

Anti-armour weapons: Six and 17 pounder anti-tank guns (obsolete British; 50 in service)

Air-defence weapons: 40mm and 3.7in guns (obsolete British; about 10 in service)

Artillery: 76mm mountain gun (Yugoslavia; 120 in service); 25 pounder gun/howitzer (obsolete British; 24 in service); 105mm howitzer (USA; 80 in service)

Armour: Humber armoured car (obsolete British; 40 in service); Ferret scout car (obsolete British; 45 in service)

Aircraft: the air force operates 10 old ground-attack fighters, 28 transports and 58 helicopters

RANK, DRESS AND DISTINCTIONS

In its early years the Burmese army wore British-style tropical uniform, unit insignia and badges of rank. It may still do so; but there is some evidence that it has reverted to the badges of rank and rank titles of the old Japanese Imperial Army, under whose aegis the Burma National Army was formed during the war. The leaders of the army received their training at the hands of the Japanese, and it is said that strong traces of Japanese influence remain, evident in a marked formality, sharp distinction between ranks and deference towards superiors.

CURRENT DEVELOPMENTS

The military tradition is strong in Burma. The British chose to believe that the Burmese did not make good soldiers, but the basis of the State which they overthrew in the nineteenth century was in fact military, and the resistance it offered them in their three Burmese wars was considerable. An unfortunate consequence of British military policy towards the Burmese was, however, that they did not include a modern, apolitical army in the administrative apparatus they bequeathed to the Burmese at independence. Political opposition to colonial rule had taken, perhaps in reaction to the British dismissal of the Burmese soldierly qualities, a specifically military form, and it was perhaps inevitable, therefore, that post-independence governments should have failed to achieve a satisfactory separation of military and civil power in the State and the subordination of the one to the other.

The tradition of dacoity — semi-criminal, semi-political banditry — was also strong, and was fostered by wartime conditions. The hill peoples in particular were armed and encouraged to war against the Japanese, and thereby learnt habits of disaffection not easily unlearned in peacetime. It was perhaps also inevitable, therefore, that opposition to the independent government should take violent forms with both its ideological and ethnic opponents. What could not be foreseen was that

the army, after winning a remarkable victory in a civil war it seemed destined to lose, and after then withdrawing from the centre of the stage for 10 years, should have re-emerged to subject the country to probably the most comprehensively military regime of all of those that have sprung up in the world since 1945. For the Burmese army did not seek merely to supplant the politicians, but also the country's civil servants and many of its native as well as foreign businessmen. Through the nationalisation of the greater part of the country's industry and trade (since partly reversed), the army achieved perhaps a greater degree of control of the conditions of national life than that attempted by soldiers anywhere. On top of its political and economic programme, it also propagated its own political philosophy — *The Burmese Way to Socialism* — which, though an unexciting *mélange* of Marxism and Buddhist ethical tenets, stands as an almost unique attempt by a military regime to implant a distinctive, intellectually coherent ideology on its subjects.

The wonder is that, amidst its political preoccupations, it has found time and energy to prosecute the war which originally gave it the pretext for political intervention, and to such effect. During the last 6 years it has made real headway against the internal dissidents — minorities and communists alike — and has also achieved the self-confidence and political maturity to begin the painful and difficult process of divesting itself of power and rebuilding a civilian administration. Through its veil of secrecy, a remarkable, and in many ways admirable, process of political and military achievement is perceptible.

JOHN KEEGAN

BURUNDI

HISTORY AND INTRODUCTION

This small African State was a colony of Germany until 1918, and of Belgium until 1962. Its major problem, however, originated in the 16th century when a pastoral Para-Nilotic ethnic group, the Tutsi, imposed themselves as a dominant people upon an agricultural Bantu peasantry, the Hutu. Extremely complex social relationships — divisions among the Tutsi and to a lesser extent the Hutu also — differentiate the clash of the two major groups in Burundi from the not dissimilar but more simplistic clash in Rwanda; the consequences however were those of violence and bloodshed on an even greater scale both before and after the departure of the Belgians. A tradition of political murder began in 1957, but the even more serious pattern of selective killings of leading Hutu personalities and educated men by the dominant Tutsi factions of the time began in 1965, and was repeated in 1969 and 1971, on the latter two occasions many leaders of losing Tutsi factions perishing at the same time. A gendarmerie officer, Micombero, took power in 1966 ending the monarchy. A full-scale revolt of the Hutu took place in 1972 in which thousands (probably between 80,000 and 100,000) lost their lives either in the revolt or the subsequent repression, both sides aiming at a 'final solution' with almost Hitlerian literalism. Torture, disembowelling and crucifixions were reported. In 1976 the Head of State, Colonel Micombero, was overthrown by a group of officers headed by Lieutenant-Colonel Bagaza, and they have pledged themselves to 'clean up' Burundi's affairs.

Strength and Budget

Population: 3,750,000 (approximately)
Strength: a national army of 5000 including gendarmerie exists
GNP: No estimate available.

Command and Constitutional Status

The Head of State and the Supreme Revolutionary Council is Lieutenant-Colonel J. B. Bagaza.

Role, Commitment, Deployment and Recent Operations

The Burundi army and gendarmerie both played leading parts in the 1972 repression.

Burundi's borders represent a threat — not from any foreign nation's ambitions but the continuing likelihood of the Hutu group attempting to cross, from safety, in the hope of overthrowing the regime.

Organisation

This appears to comprise a 'commando' battalion at Gitega, a 'parachute' battalion at Bujumbura, one (and possibly two) other battalions and a logistic unit.

Recruitment, Training and Reserves.

The army is almost exclusively Tutsi.

Belgian officers and advisers, who had become linked with one of the Tutsi factions, were returned home in 1968. Chinese assistance was used briefly in the mid-1960s.

French military assistance, including personnel (probably on contract) appears to have played an unattractive role in the 1972 repression. A military training and an aid agreement was signed with France in 1969. Units of the Zaïre army also maintained order in the capital, Bujumbura, while the Burundi army suppressed the revolution in the rural areas.

An armed forces training school exists.

Equipment and Arms Industry

Small arms have arrived from a variety of sources; vehicles (including those of UNICEF) were commandeered for use in the 1972 repression. A small number of Panhard armoured cars are in service.

Rank, Dress and Distinction

No information is available.

Current Developments

The Burundi army exists to perpetuate rule of the country by an ethnic minority.

L. L. MATHEWS

CAMEROUN*

HISTORY AND INTRODUCTION

Cameroun, a former French possession, became independent in 1960; it was formed from the bulk of the former German colony of Kamerun which had passed into French administration. To it was added in 1961 one of the two parts of Kamerun that had been administered by Britain (the other opted for union with Nigeria). The State is a Federation, but the vastly larger Francophone area predominates. In addition to the division caused by its colonial past, Cameroun also has ethnic divisions, and a religious one in that the northern part of the territory has a considerable Muslim population.

The country gradually became a one-party State; since 1960 the Head of State has been President A. Ahidjo. This continuity has, however, not been without opposition. In the last years of the colonial period a revolt broke out among the Bamileke people which continued for a period after independence and was only put down by French troops. Further trouble among the Bamileke reappeared in the late 1960s, Chinese support for the insurgents being alleged. French troops again played a part in the suppression, to all intents and purposes complete by 1970. The Cameroun authorities exacted severe punishments on those alleged to be leaders. By a new co-operation agreement with France signed in 1974, the French garrisons at Douala and Koutaba were finally withdrawn.

Strength and Budget

Population: 7,200,000 (approximately)

Armed forces: 5600 — an army of 5000; navy and air force of 300 each; paramilitary forces totalling some 10,000 and comprising a *Sûreté Nationale*, a gendarmerie, a *Brigade Mixte Mobile* and a security service known as the *Direction de Documentation*.

GNP: \$1,700,000,000 (estimated)

Command and Constitutional Status

The President of the Republic, A. Ahidjo, is the supreme authority. The Minister for Defence is S. Daodu. General P. Semengue is Inspector-General of the Armed Forces and Colonel T. Malongue is Commander of Ground Forces.

Role, Commitment, Deployment and Recent Operations

The army's roles are that of internal security and defence against threats from neighbours; Cameroun adjoins six countries. There has been friction with Nigeria which led to brief exchanges of fire by border guards. A 4 mile neutral corridor has been agreed. Suspicion of Congo's intentions — and support for Cameroun dissidents — occurs from time to time; in 1967 troops were sent to the border. Suspicion of Equatorial Guinea also exists and troops may also be deployed on this frontier. Cameroun forces were, of course, also committed to the suppression of the Bamileke risings, and in the containment of university unrest at Yaoundé in 1973. The role of the air force was recently officially defined as the dropping of men and supplies, patrolling and rescue.

Organisation

Cameroun's army consists of four infantry battalions each based in one of the country's four military districts, a reconnaissance company, a parachute company and some engineer, signals and transport units. The military districts are Yaoundé, Kutuba, Douala and Baffoussam.

Recruitment, Training and Reserves

The recruitment of the army was voluntary until 1975 when a system of obligatory military training for all fit men to prepare them for service in the police, army or gendarmerie, was announced.

French training facilities have been used since independence; a small French training staff still remains, and reports suggest a few French-born officers, probably contract personnel, present in Cameroun uniform.

* For general notes on African armies, see Appendix 1.

Equipment and Arms Industry

Cameroun has no arms industry. The infantry weapons (including 81 mm mortars) are French. The reconnaissance company's armoured cars are American M8 and British Ferret; the artillery includes French 75 mm and 105 mm guns, and 57 mm anti-aircraft weapons. Some 105 mm guns are on order from Belgium to replace obsolete British 6pounder weapons.

Rank, Dress and Distinctions

These follow the French pattern; the *képi* is however replaced by a peaked cap in the army.

Current Developments

The Cameroun army is a small force that meets its country's modest needs.

L. L. MATTHEWS

CANADA

HISTORY AND INTRODUCTION

With the passing of the British North America Act in 1867, Canada became a self-governing Dominion within the British Empire. While the Canada of today is a huge nation that sprawls over 3,200,000 square miles, the original Federation encompassed only a comparatively small area centered on the St. Lawrence river valley. The geographic expansion of the country on an east–west axis occupied the remainder of the nineteenth century. Development of the Arctic did not even begin until after World War I, and even today the high north remains largely a frontier land.

Carving a nation out of a wilderness was a major endeavour. Fortunately, the task was not complicated by the need for elaborate and costly defence measures. Many factors contributed to this favourable situation. First and foremost, there was the security of isolation. The vast expanses of the Atlantic and Pacific were effective barriers to aggression while, to the north, the polar wastes were even more formidable obstacles. The ubiquitous Royal Navy added another layer of safety. Then there was the United States.

In the late nineteenth century, the United States was yet to emerge as a world power, but the tremendous potential of that country was evident. During the American Civil War (1860–1865) relations between the Union and Britain had deteriorated steadily but the trend had stopped short of war. In Canada, apprehension over possible American designs on the north had been one of the factors leading to confederation. In 1871, however, the Treaty of Washington between the United States and Britain removed sources of friction arising out of the events of the civil war. As long as amicable relations with the United States was a cornerstone of imperial foreign policy, Canada's southern frontier was secure. Given these conditions, there was no imperative to develop the defence establishment. Strategic security, an economic depression in the years following confederation and the pressing needs of nation-building, all contributed to the initial impoverishment of the Canadian 'army'.

Canada inherited the beginnings of a military establishment from Britain, and, until very recently, the British connection was the most important military fact in the Dominion. In the early years of nationhood, military enthusiasm ran high. The 'threat' from the United States had not been resolved: Fenians, attempting to embarrass Great Britain into resolving the Irish home-rule problem, periodically launched small raids from American States into Canada. In 1870 there was a minor rebellion in the Red River Colony to the west which warranted the raising of a small expeditionary force composed of British regulars and Canadian militiamen to put it down. British regular units stationed in Canada also provided training facilities and instructors. In 1871, however, the British units were withdrawn and Canada was left to fend for herself.

Canada's 'army' was known as the Militia, and had three components. The Reserve Militia was supposedly composed of all the able-bodied men in the country between the ages of 16 and 60, but there was no organisation, no equipment and no mobilisation plan. The force could not even be dignified with the term 'paper army', since there were not even nominal rolls of those eligible to serve. All that can be said of the Reserve Militia is that it represented some vague potential.

The Non-permanent Active Militia, on the other hand, had somewhat more substance. It was the major element of the Canadian defence establishment. Even so, it was a modest organisation, composed of part-time volunteers who served only 14 days a year. Organisation, doctrine, equipment and customs closely followed the British model. In its early years the force consisted solely of cavalry, artillery and infantry units, but in the decade preceding the outbreak of World War I a start was made in creating the necessary support arms, services and staffs required by a balanced field force. From 1867 to 1914, the strength of the Active Militia grew in fits and starts from 25,000 to a pre-war peak of about 50,000 all ranks.

The third component of the Militia was the Permanent Force, the Canadian equivalent of a standing army. The force was originally raised in the early 1870s to maintain the various military works left by the departing British. Its role quickly evolved into that of a training cadre for the Active Militia. In this respect, its early successes were limited as it proved difficult for this miniscule army to find time even to train itself. In August, 1914, it numbered less than 2000.

With this tiny, ill-trained, ill-equipped force, Canada went to war. Yet the Militia was well off compared to the rest of the defence establishment. There was no air force nor did the Militia own any aircraft. The newly created Royal Canadian Navy was foundering on the shoals of political disagreement. The question as to whether Canada should simply contribute to the upkeep of the Royal Navy, or attempt to raise her own maritime forces had not been satisfactorily resolved before the war. The RCN consisted of two cruisers, one on each coast.

The Dominion's war effort focused upon the army. A divisional-size expeditionary force was raised in a matter of weeks and dispatched to Britain. Canada balked most strongly when the War Office made known its intention to break up the force into reinforcement drafts for British units. Despite initial problems in obtaining qualified senior commanders and staff officers, it was never accepted — in Canada — that Canadian forces would fight other than together. For the initial years of conflict, Britain provided the senior officers. By war's end, however, what had grown to a corps of four divisions was commanded and staffed almost exclusively by Canadians — most of them pre-war Militia officers.

Six hundred thousand Canadians, out of a total population of 12,000,000, served during World War I; 60,000 died. By 1917, the replacement requirements of the Expeditionary Force forced a reluctant government to resort to conscription.

Their reluctance was well founded. There was a fundamental difference in perception of the war, and Canada's proper role in it, between English- and French-speaking sections of the country. In general, English-speaking Canadians were much more attuned to the Imperial connection than were their Francophone countrymen. This, the fact that the command structure operated exclusively in English, and an incredibly inept recruiting programme, resulted in a distinct lack of enthusiasm for the war in the province of Quebec. Conscription virtually divided the country into two mutually hostile camps.

Having fought the war to end all wars, Canada quickly returned to the pre-war pattern in military affairs. To the Active Militia and Permanent Force were added a nascent navy and air force, but in no sense was the defence establishment regarded as being a key facet of the national effort. The great depression brought a slashed defence budget. When the inevitability of another conflict with Germany became apparent in the late 1930s, the Canadian rearmament programme was inevitably a matter of too little, too late. Britain, Canada's traditional source of equipment, was fully engaged in her own rearmament programme, and precious little was available for Canada. In 1939, fewer men underwent the 14 days of annual training than had on the eve of war in 1914.

The World War II pattern of Canadian military effort was essentially similar to that of World War I. In a spasm response, a million men and women were recruited into the forces over the 6 years of war. The focus of the Canadian war effort was the Atlantic and Europe, with the majority of personnel serving in the army. Mindful of the conscription crisis of World War I, the government adopted a policy of 'conscription if necessary, but not necessarily conscription'. While many men were conscripted for service in Canada, only a few thousand of them were eventually drafted overseas.

With the beginning of the cold war, Canada gave up her traditional reliance upon the Militia and opted for collective security and forces-in-being. Co-operation with the United States for the defence of North America, which had begun in the early months of World War II, was continued and expanded in the air and on the ground. Canadian membership in NATO brought an initial commitment of an air division of four wings and a 6000-man brigade group to Europe.

Canada has been a strong supporter of UN military operations. A brigade group served in Korea, and elements of the Canadian forces have participated in every one of the numerous peace-keeping and truce-observation bodies that the UN has formed over the last two decades.

Post-war strength of the forces peaked in the early 1960s when the Canadian defence establishment numbered some 120,000 regulars, of whom 50,000 were army (50,000 air force, 20,000 navy). In the same period, the Militia declined in size and importance when compared to its traditional status.

The most significant event in Canadian post-war military development was the integration and unification of the forces in the mid and late 1960s. In the place of individual services Canada opted for a single Armed Force. The project held the prospect of increased flexibility, lower manpower requirements, and a greater portion of the defence budget being available for capital expenditure. Functional commands were created: Mobile Command became the post-integration equivalent of the Canadian army. A series of reorganisations, restructurings and changes of priorities have followed unification. Overall force levels have dropped steadily to where they now stand at about 65% of their former post-war high. The impact of inflation, rising absolute costs of military hardware, and increasing operating costs have cut severely into that portion of the defence budget available for capital expenditure. At the end of 1975, Mobile Command was stretched to its apparent limit in terms of manageable tasks, personnel and equipment. A defence structure review is currently underway.

STRENGTH AND BUDGET

Population: 23,370,000

Canadian Armed Forces: 80,000 regulars, 22,000 reserves

Land Element (army) Mobile Command: 17,700 regulars, 15,200 reserves

Canadian Mechanised Brigade Group in Europe (NATO): 3000 regulars

Navy: 13,400; 29 major vessels, 12 smaller

Air force: 36,600; 210 combat aircraft

GNP (1976 estimate): \$US 175,300,000,000

Defence expenditure (1977-8): \$U.S. 3,610,000,000

COMMAND AND CONSTITUTIONAL STATUS

Command

The Governor-General, as Head of State, is the titular Commander-in-Chief of the Canadian Armed Forces. The Federal cabinet is responsible for all matters of defence policy. A bipartisan Standing Committee on External Affairs and National

World Armies

Defence of the House of Commons assists the cabinet in its deliberations. The Chief of the Defence Staff (CDS) is the senior military advisor to the government and is responsible for the conduct of all operations of the Canadian Armed Forces. Within the unified force structure there are no chiefs of individual services, although the commanders of the three environmental commands correspond roughly to such positions.

The Department of National Defence is headed by the Ministry of National Defence. The Deputy Minister and the Chief of Defence Staff are directly responsible to him. The five functional commands are under the direct command of the CDS, who is assisted in exercising direction and control by the staffs of National Defence Headquarters.

Constitutional Status

Canada does not have a formal constitution, but the British North America Act assigns Federal and Provincial responsibilities, naturally giving defence to the Federal government. The Militia Act, Naval Service Act and Air Force Act were all eliminated in 1950 by a single National Defence Act (NDA), although the three traditional services remained distinct entities. In 1968, the NDA was amended by the Canadian Forces Reorganisation Act which eliminated the individual services, replacing them with a unified Canadian Armed Forces.

The National Defence Act is the source of authority for the Minister of National Defence and the CDS. The Deputy Minister of National Defence, the senior civil servant in the Department, draws his authority from a variety of acts; his prime responsibility is the financial administration of the Department.

ROLE, COMMITMENTS, DEPLOYMENT AND RECENT OPERATIONS

Role

The role of the Canadian Armed Forces flows from the stated national aims that:

1. Canada will continue secure as an independent political entity.
2. Canada and all Canadians will enjoy enlarging prosperity.
3. All Canadians will see in the life they have and the contribution they make to humanity something worthwhile preserving in identity and purpose.

Defence priorities are:

1. Surveillance of Canadian territory and coast lines, i.e. the protection of Canadian sovereignty.
2. Defence of North America in co-operation with U.S. forces.
3. Fulfilment of such NATO commitments as may be agreed upon.
4. Performance of such international peacekeeping roles as Canada may, from time to time, assume.

Commitment

'Army' commitments of the Canadian Armed Forces include those fulfilled by elements of Mobile Command in Canada and the land component of Canadian Forces Europe. Canadian-based units are all multi-tasked.

Force commitments may be divided into four categories:

1. Defence of North America. A major land invasion of the continent is inconceivable at this time. To deal with any small-scale incursion or raid, Canada maintains an airborne regiment, an air-portable combat group, and two squadrons of CF5 aircraft in the ground attack/reconnaissance role. The United States Army has a similar sized force in the same role. On operations involving protection of Canadian sovereignty, the Canadian Forces would act alone.
2. Internal Security. The Chief of Defence Staff has a legal obligation to respond to requests for aid of the civil power and aid of civil authority. Such requests for military assistance must be raised by the provincial Attorneys-General. While any Canadian-based unit in the forces is liable for internal security duties, such calls are normally placed on Mobile Command units because of their particular skills and capabilities.
3. NATO. Army components of Canada's NATO commitment include a small mechanised brigade group deployed in the CENTAG area of Germany and a Canadian-based air mobile battalion as part of the Allied Commander Europe's Mobile Force (Land) North (AMF(L)North). Under certain conditions the AMF(L) commitment could be built up to brigade group strength by deploying the Canadian Air-Sea Transportable (CAST) Combat Group.
4. United Nations. An air mobile force of battalion group size from Mobile Command is maintained on UN stand-by in Canada. The Canadian Airborne Regiment currently has this responsibility.

Deployment

Mobile Command (HQ: St. Hubert, Quebec)

The current deployment of Mobile Command is not based upon any tactical or strategic requirement, although the nation-wide location of units reflects the requirement to respond to requests for aid to the civil power. The deployment has

been largely determined by historical association, financial restraints, and political/economic considerations. The Command is responsible for Canadian Forces Bases at Calgary, Alberta; Gagetown, New Brunswick; London, Ontario; Montreal, Quebec; Petawawa, Ontario; Shilo, Manitoba; Suffield, Alberta; and Valcartier, Quebec. Mobile Command exercises command and control over the following major formations.

1 Combat Group

Artillery: 3rd Regiment, Royal Canadian Horse Artillery (Shilo, Manitoba).

Armour: Lord Strathcona's Horse (Royal Canadian) (Calgary, Alberta).

Infantry: 1st Battalion, Princess Patricia's Canadian Light Infantry (Calgary); 2nd Battalion, Princess Patricia's Canadian Light Infantry (Winnipeg, Manitoba); 3rd Battalion, Princess Patricia's Canadian Light Infantry (Esquimalt, British Columbia).

2 Combat Group (all units located at CFB Petawawa, Ontario, except 1 RCR)

Artillery: 2nd Regiment, Royal Canadian Horse Artillery.

Armour: 8th Canadian Hussars (Princess Louise's).

Infantry: 1st Battalion, The Royal Canadian Regiment (London, Ontario); 3rd Battalion, The Royal Canadian Regiment.

5e Groupement de Combat (all units located at CFB Valcartier, Quebec, except 2R22eR, a Francophone formation)

Artillery: 5e Régiment d'Artillerie Légère du Canada.

Armour: 12e Régiment Blindé du Canada.

Infantry: 2e Bataillon, Royal 22e Régiment (La Citadelle, Quebec City); 3e Bataillon, Royal 22e Régiment.

Combat Training Centre (all units located at CFB Gagetown, New Brunswick, except detachment)

2nd Battalion, The Royal Canadian Regiment; Combat Arms School; Détachement de l'École des Armes de Combat (Valcartier, Quebec).

The Canadian Airborne Regiment (all units located at CFB Edmonton)

1st Airborne Battery; 1er Commando Aeroporté (Francophone unit); 2nd Airborne Commando.

1st Canadian Signal Regiment (CFB Kingston, Ontario)

Militia Areas: HQ Pacific Militia Area (Vancouver, British Columbia); HQ Prairie Militia Area (Winnipeg, Manitoba); HQ Central Militia Area (Toronto, Ontario); Quartier Général Secteur de L'Est (Montreal, Quebec (Francophone area)); HQ Atlantic Militia Area (Halifax, Nova Scotia).

Canadian Forces Europe (HQ: Lahr, West Germany)

All land components are located in Lahr, West Germany, with the exception of 3 Canadian Mechanised Commando.

4 Canadian Mechanised Brigade Group

Artillery: 1st Regiment, Royal Canadian Horse Artillery.

Armour: The Royal Canadian Dragoons.

Infantry: 1er Bataillon, Royal 22e Régiment. 3 Canadian Mechanised Commando (Baden-Soellingen).

Note: both the NATO brigade and all Mobile Command formations include a full range of engineer, communications, service support, medical, and air-control units.

United Nations

Current commitments include a 550-man force based on an infantry battalion in Nicosia District, Cyprus, as part of UNFICYP, and 950 personnel in a logistic support role in UNEF II in the Middle East. UN tours are of 6 months' duration. Rotation in UNFICYP is carried out on a unit basis, in UNEF II on a man-for-man basis.

In addition, Canada provides observers to several other UN operations.

Recent Operations

Combat. Major operations in the 20th century include a four-division corps fighting on the western front in World War I, and a field army of five divisions in north-west Europe during World War II. Canada's last combat operation saw the deployment of an infantry brigade group to Korea.

Peacekeeping. Included among these operations are Egypt 1956–67 (UNEF), the Congo, Kashmir, Cyprus and UNEF II (1973–). In addition, Canada participated in two peacekeeping (or war watching!) operations in Indo-China. Canadian Land Forces have a very high level of expertise and experience in UN-type operations.

Aid of the Civil Power. In the autumn of 1970, a series of incidents involving radical Quebec 'separatists' caused the Federal government to declare a state of 'apprehended insurrection' and invoke the War Measures Act giving the police wider powers than normal. The majority of Mobile Command units were deployed into the Ottawa–Montreal area in aid of the civil power, where they remained until the crisis ended late in the same year.

World Armies

ORGANISATION

National Defence Headquarters (NDHQ) exercises command and control over the five functional commands of the Canadian forces, these being Maritime Command (navy), Mobile Command (army), Air Command (air force), Canadian Forces Europe and Communications Command. The latter two are separate and distinct from the environmental commands. The Canadian Forces Training System and miscellaneous minor establishments independent of any command are controlled directly by NDHQ.

Mobile Command consists of three combat groups (small brigade groups), each composed of: one light artillery regiment, one light armoured regiment, two or three infantry battalions, and supporting units; a Combat Training Centre, which supplies specialised training to all levels; an airborne regiment composed of two small battalions (commandos) and support arms and services; a signal regiment; and an airborne centre. A mechanised brigade group forms the land element in Canadian Forces Europe.

Note: of the 27 officer classifications and 65 military trades, only a small portion — the combat arms and the combat support specialties — can be identified as uniquely land or 'army' oriented. Members of support services (i.e. logisticians, communicators, etc.) and professional specialties (i.e. doctors, dentists, lawyers, etc.) cannot be identified by environment. Men and women in these specialties can and do move from environment to environment. It would not be in the least extraordinary, for example, for a medical assistant to do one tour at sea aboard a destroyer escort, and find himself attached to a mechanised infantry battalion for the next.

RECRUITMENT, TRAINING, RESERVES AND CADETS

Recruitment

There is no conscription in Canada, and service in both the regular forces and the reserve is completely voluntary. Recruiting of both men and women is designed to fill overall requirements, while assignment to specific branches or trades is based upon a combination of vacancies available, individual interest and ability. The basic initial period of enrolment is 4 years.

The composition of the Canadian Armed Forces is designed to reflect national aspirations. Current recruiting aims at balancing the forces on a 73%-Anglophone-27%-Francophone level. Bilingualism is encouraged through an extensive system of language courses and other more subtle incentives. A study group is presently examining the need to identify and designate several thousand establishment positions as requiring a bilingual incumbent. Similarly, women are eligible to serve in all but the combat trades.

Training

Other-rank recruits are trained at common forces-wide recruit training schools. There are two of these facilities, one catering to the needs of Anglophone candidates, the other for Francophones. Basic and advanced trades training is carried out at branch schools where, again, instruction is offered in both official languages. There is also a full range of NCO academies where formal instruction in command and technical skills is provided.

Officer recruits enter the forces through several programmes, the most important of which is the Regular Officer Training Plan (ROTP). Selected candidates attend one of the three Canadian military colleges or a civilian university. Basic training is carried out in the summer during the break in the academic year. Commissioning usually follows attainment of a baccalaureat degree.

The Staff Training Programme includes a Forces Staff School for junior officers, a Land Forces Command and Staff College (senior captains), a Forces Staff College (majors) and a National Defence College (lieutenant-colonels and colonels). Selected officers pursue advanced academic degrees on an 'as required' basis.

Reserves

The Militia is the land component of the Canadian Forces Reserve. All arms, support arms and services are represented in the Reserve, although the largest organised field force is the battalion. Militia units are linked to a high degree to regular formations of Mobile Command.

There is no compulsion on the individual militiamen to attend annual training concentrations, although career progression is naturally highly dependent upon such participation. Current Canadian law makes no provision to ensure the job security of militiamen undergoing annual training. This anomaly has been identified and legislation is apparently under consideration to correct it.

Cadets

The cadet movement in Canada is moderately strong. As part of the Department of National Defence's contribution to national development, the cadet movement aims at developing leadership skills, good citizenship and self-confidence in young Canadians. The production of recruits for the regular forces is not a primary objective of the cadet programme, although a significant proportion of recruits have had some cadet experience.

The traditional service affiliations have been retained by cadets. Army cadets number 26,000 out of a total 62,000 in the entire cadet organisation. 404 of the 972 cadet corps are army. Participation in cadets is voluntary and is open to both boys and girls.

EQUIPMENT AND ARMS INDUSTRY

Equipment

Small Arms

- Pistol:* 9mm Browning (Belgium; made in Canada)
- Sub-machine-gun:* 9mm Stirling (UK; made in Canada)
- Rifle/automatic rifle:* 7.62mm NATO FN C1/C2 (Belgium; made in Canada)
- General purpose machine-gun:* 7.62mm NATO Browning 1919 (USA)
- Light anti-tank weapon:* 66mm LAW (USA)
- Medium anti-tank weapon:* 84mm Carl Gustaf recoilless gun (Sweden)

Support Weapons

- Mortar:* 81 mm L5 (UK)
- Heavy machine-gun:* 0.50in Browning HB M2 (USA)
- Heavy anti-tank weapon:* 106 mm M40 A1 recoilless rifle (USA); SS11 B1 ATGM (France); TOW (USA) now replacing 106mm and SS11

Anti-aircraft Weapons: Blowpipe LLAD SAM (UK), presently entering service; 40mm Bofors (Sweden) fixed mount point defence of Canadian NATO air bases

Artillery: 105 mm L5 pack howitzer (Italy) — equips Airborne and AMF(L) batteries; 105 mm C1 (M1A1 USA) towed howitzer — interim, equips Canadian-based batteries; 155 mm M109 (USA) SP howitzer — equips NATO-deployed batteries

Armour

- APC:* M113 (USA)
- Recce:* M113 1/2 Lynx (USA)
- Tank:* Centurion Mk 11 (UK) with 105 mm gun in Germany; Canadian-based tanks are mostly Mks 3/5 equipped with 20-pounder guns.

Aircraft

- Light observation helicopter:* Bell OHO58A (USA)
 - Utility helicopter:* Bell CUH-IN (USA)
 - Medium helicopter:* Boeing CH47-C Chinook (USA)
 - Light tactical fighter:* Northrop CF5 (USA)
- Note:* tactical air resources belong to Air Command but are under the operational control of appropriate land formations.

Arms Industry

Minor items of clothing and equipment are mostly manufactured in Canada from Canadian designs. In the 1950s Canada attempted to design and build major items of equipment such as an APC and a supersonic interceptor. The failure of these projects to reach a production stage despite considerable sums of money being spent on research and development was a bitter experience for the country. Today, with the exception of warships, most major equipment is of foreign design. Much of this is manufactured in Canada under licence and modified to meet specific Canadian needs. Such a method is naturally preferred to buying 'off the shelf', but the latter approach was necessary for armour, artillery and helicopters.

In 1974, Canada exported a total of \$280,500,000 in military equipment. About two-thirds of military exports are consistently purchased by the United States, and most of the remainder by NATO allies. Over the past 10 years, however, Canadian firms have sold military equipment to a total of 73 countries. A government agency, Canadian Commercial Corporation, has been formed to act as a go-between in such sales; all privately arranged sales require an export permit from the Department of External Affairs. Exports consist mainly of aircraft, aero-engines and parts, electronics, and radio equipment.

Not included in the above statistics are the nuclear reactors which have been sold abroad with the stipulation that these be used for peaceful purposes only. India's Candu reactor was used to produce her first nuclear device.

World Armies

RANK, DRESS AND DISTINCTIONS

Rank

General	Four maple leaves
Lieutenant-General	Three maple leaves
Major-General	Two maple leaves
Brigadier-General	One maple leaf
Colonel	Four wide stripes
Lieutenant-Colonel	Three wide stripes
Major	Two wide stripes bracketing a narrow stripe
Captain	Two wide stripes
Lieutenant	One narrow stripe above one wide stripe
Second-Lieutenant	One wide stripe
Officer Cadet	One narrow stripe
Chief Warrant Officer	Coat of Arms of Canada
Master Warrant Officer	Crown and laurel wreath
Warrant Officer	Crown
Sergeant	Three chevrons
Master-Corporal	Maple leaf over two chevrons
Corporal	Two chevrons
Trained Private	One chevron

Gold-coloured rank badges are worn by general officers on shoulder straps, by all other officers and warrant officers on the lower arm, and by NCOs on the upper arm.

Dress and Distinctions

Canadian parade and walking-out dress is a rifle-green tunic and trousers, and peaked forage cap. Work dress is also rifle green, usually worn open at the throat. Combat clothing is Canadian-designed olive drab uniform with a U.S.-pattern steel helmet. Troops of the Airborne Regiment wear a camouflaged jump smock. Branch or regimental badges are worn on the collar and on the cap.

CURRENT DEVELOPMENTS

The 'army' and, for that matter, the entire Canadian Armed Forces, currently is stretched to the absolute limit of capability. Economies have been created by manpower reductions and 'multi-tasking' all Canada-based units. In the same vein, equipment procurement programmes have been held in abeyance.

While Mobile Command elements have maintained their capability to respond to the full range of their current missions, serious difficulties could be expected to arise if the Command were ever called upon to fulfil several missions at the same time. The planned use of Militia elements in times of crisis helps to alleviate this problem to some extent.

A large number of equipment types are currently reaching the end of useful life. Several major purchases must be made in the near future if present capability levels and tasks are to be maintained. Chief among these is a requirement for a replacement of the Centurion main battle tank deployed in Europe. New artillery and tactical air-defence weapons are also urgently required. The land element is not alone in its need for new equipment. Air Command needs a replacement long-range-patrol aircraft to meet both anti-submarine warfare commitments and the needs of sovereignty protection. A new generation of fighter aircraft will also be required in the near future. Present force development plans aim at eventually providing 20% of the defence budget for such capital procurement.

Unification has been a modest success, although changed perceptions of the international situation, new defence priorities and spiralling inflation have negated many of the project's promised advantages. The trauma of the change has passed and the system has proved to be workable. There is no significant call for 'de-unification' either within the Department of National Defence or without.

The current first defence priority — the protection of sovereignty — has not been easily assimilated by Mobile Command. The focus of concern to date has been upon the northern territories, but in the absence of a clearly defined challenge to national sovereignty, operations have been oriented towards the provision of a symbolic presence and the development of an improved operating capability in that often hostile environment.

Peacekeeping has been, on the whole, an unhappy venture. The short-term stability provided by the interposition of a UN force has not, in general, led to the hoped for long-term peace. Still, peacekeeping operations are taken very seriously

by Mobile Command, and UN training is a standard feature of the annual training cycle. UN operations provide a high level of individual satisfaction, in as much as participation is commonly perceived as a significant contribution to world order and tranquillity.

In many ways, Canada's contemporary strategic situation today is analagous to that which existed in the early years. The umbrella of the American deterrent covers the country, and sheer distance and isolation still removes the nation from the arena of intermediate- and low-level conflict that disrupts other areas of the globe. Defence policy and force capability are not a major national issue. The main focus of national concern is the state of the domestic economy. Should this situation change over the next few years (and it is difficult to envisage the nature of such a change) the greatest strength of the Canadian forces will probably be found to lie in the professionalism of its individual members.

K. C. EYRE
CATHERINE EYRE

CAPE VERDE ISLANDS

A small military force (*see also* Guinea – Bissau) is being organised in this State; no details are yet available but East German advice and equipment is being sought.

C. S. LUGARD

CENTRAL AFRICAN EMPIRE*

HISTORY AND INTRODUCTION

The Central African Republic attained independence from France in 1960; in the colonial period this territory had been named after its two main rivers, Oubangui–Chari. It remained under a civilian government until December 31st, 1965 when a military coup took place, the army being headed by its commander, (the then) Lieutenant-Colonel J. B. Bokassa. The reasons for the coup appear to have been allegations of corruption and nepotism, too close an involvement with China and a budgetary crisis. Colonel Bokassa, who first promoted himself to Marshal, and then, in 1976, proclaimed himself Emperor, has ruled the C.A.E. since that date. The style of his rule is severely authoritarian, and he maintains generally (despite occasional showy outbursts) as close a relationship with France as he can. The Emperor himself and most of the country's leadership comes from the Mbaka ethnic group.

Evidence of opposition appears from time to time. A former close friend and associate of the Emperor, Colonel Banza, attempted unsuccessfully to overthrow him in 1969, and there appears to have been other military conspiracies discovered by the government in 1973 and 1976, and a gendarmerie plot in 1974.

France maintained a base at Bangui until 1971 when it was closed. Most of the French garrison troops had in fact left earlier. France retains a strong uranium mining interest in the C.A.E., however, and is likely to support any government which preserves it.

Strength and Budget

Population: 2,000,000 (approximately)

Armed forces: army of 800, together with an air force of 100, a gendarmerie of 500 and an Imperial Guard of 700, some of whom are women.

Command and Constitutional Status

Emperor Bokassa is also Minister of Defence; Prince B. Bokassa is Head of the Armed Forces and General Mayomokolo is Chief of Staff.

Role, Commitment, Deployment and Recent Operations

The C.A.'s army role is one of internal security.

Organisation

The C.A.E.'s army consists of one infantry battalion, supported by engineer and signals sub-units. Under the Bokassa government the size of this battalion has been increased. Although detachments are posted elsewhere, most of the battalion is located at Bouar. The Imperial Guard is posted to the capital, Bangui.

Recruitment, Training and Reserves

A selective national service operates, 2 years' service being required.

Equipment and Arms Industry

Until recently all equipment for the army was French, but Soviet and Israeli rifles and sub-machine carbines were noted in 1977. The infantry battalion's armoury includes 81 mm mortars. A few Douglas Skyraider aircraft, four French and three Soviet helicopters, together with small transport and liaison flights, comprise the air force.

Rank, Dress and Distinctions

These follow the French pattern, except that peaked caps have replaced the *képi*. The women soldiers of the Imperial Guard have a ceremonial uniform of black boots, long black skirts, and red tunics and berets.

* For general notes on African armies, see Appendix 1.

World Armies

Current Developments

This army has been put to strange purposes; one of these, the 1972 public beating-up of prisoners in Bangui ('one soldier per prisoner' in the words of Bokassa) attracting world criticism. More recently Imperial ceremonial has been a major priority. It is not a force of any real significance.

L. L. MATHEWS

CHAD*

HISTORY AND INTRODUCTION

The former French colony of Chad attained independence in 1960. It is a very large mostly semi-desert country, but with a southern and western section of greater population and better vegetation. This geographical division is approximately matched by a major ethnic one: in the semi-desert areas Muslim peoples, mostly nomad, feel kinship with the north of Africa. In the south and west are negro peoples, Christian and animist.

From independence to a military coup in 1975, Chad was ruled by President François (later Ngarta) Tombalbaye. At no time has the political life of Chad been easy — a reflection of its ethnic divisions. Tombalbaye's government was largely one of Sara and Majingaye peoples from the south and west. Plots against Tombalbaye were discovered in 1963 and in 1967, but it was the following year, 1968, that Chad's major problem, the revolt of the Muslim north under the FROLINAT movement, began. Chad, because it had been the first territory of France to respond to de Gaulle's call in 1940, was able to draw on considerable French support. The French garrison was deployed and later further troops were brought from France. Zaïre sent a small air liaison unit. U.S. help also arrived and Israel trained a 200-strong Chad parachute unit. Fighting continued in the Borkou–Ennedi–Tibesti region; by the end of 1972 some 50 French soldiers and 500 Chad soldiers had been killed. A total force of some 1800 French troops drawn from the 6th and later the 3rd Régiments de Marine were involved in 1968 and 1969. The French army commander, General Cortadellas, lost his own son among the Frenchmen killed. Cortadellas may well prove to be the last of the long line of French '*généraux d'Afrique*'.

French views on Chad were modified in the years after the death of de Gaulle and in the light of France's interests in Libya; also one group of the insurgents abandoned the struggle. The French began to scale down their involvement in 1970, withdrawing most troops from the fighting zones in 1971 and 1972. In 1975, following the Mme Claustre abduction in which the French government was obliged to deal directly with the insurgents, the new Chad President, General Malloum, in protest demanded that the French withdraw. Whether this withdrawal was meant literally or not is doubtful. Some French units departed, others remained in Chad uniforms. French assistance was in any case absolutely indispensable and new agreements for French military aid were signed early in 1976 since when some 600 French 'military advisers' have been reported to be in Chad. These are said not to be involved in the fighting, but there is no doubt that some at least have remained committed, although from Paris the continuing conflict is still officially seen as having become localised, with the Chad army build up to a sufficient strength to contain the insurgents, a view stated in the context of Franco–Libyan relations. In July, 1977 the arrival of a French unit prevented the loss of Ounianga Kebir to the insurgents, but it has since been lost. Fighting groups of Muslim insurgents now dominate almost all the centre and north of the territory, while Libyan forces appear to have entered, and to all intents and purposes annexed, the Aouzou area near the north-west border. At the time of writing, the Chad forces were attempting to hold a line very much further south, based on Abéché.

Tombalbaye's government proved less and less able to meet the demands of the situation, one made worse by drought and administrative incompetence. Further plots to overthrow him were alleged to have been discovered in 1971, 1972 and 1973. In 1975 the Chad army overthrew Tombalbaye who was killed in the coup; FROLINAT alleges French complicity in the coup but this is uncertain. A Council of Military Officers under the Presidency of General Malloum now rules Chad in face of the revolt of the north but seems as powerless as its predecessor despite the fact that FROLINAT appears now to have fallen apart into five or six rival groups. An attempt to assassinate Malloum in 1976 failed as did an abortive coup in 1977. Early in 1978 Libya's Colonel Gadaffi accepted, amid much publicity, a ceasefire on the basis of Chad promises for political reform. However Gadaffi did not have links with some of the groups and in general his sincerity overall remains doubtful. Fighting is likely to continue. Recent developments have favoured the insurgents; in February, 1978 Faya-Largeau, the chief city in the Borkou–Ennedi–Tibesti region, fell to FROLINAT, who also secured a large number of military prisoners.

STRENGTH AND BUDGET

Population: 4,275,000 (approximately)

Armed forces: 5000 army, 200 air force and 6000 gendarmerie

GNP (1972 estimate): \$400,000,000

* For general notes on African armies, see Appendix 1.

World Armies

COMMAND AND CONSTITUTIONAL STATUS

General F. Malloum is Head of State, President of the Council of Military Officers and Minister for Defence. The Chief of Staff is General N. Odingar.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

The role of the army of Chad is that of attempting to preserve the authority of N'Djamena (formerly Fort Lamy) over the rest of the territory; in simple terms, national survival. The army has been continuously committed to this role since 1967, as already noted.

ORGANISATION

The Chad army, greatly expanded since 1960, consists at present of three infantry-battalion-size groups; a fourth is in the process of establishment. Some of the infantry are parachute-trained. There is also a reconnaissance unit.

The normal deployment of the army is in three groups as follows: Group I at Mongo, comprising an infantry and a motorised infantry company, and two parachute companies; Group II at Abéché comprising one infantry and one parachute company, and two motorised infantry companies; Group III at Largeau comprising one infantry company and three specialist Saharan sub-units, these latter in normal times are stationed at Faya-Largeau and Ounianga Kébir. In addition, two reserve parachute companies are stationed at Sahr and Loumia.

The gendarmerie comprises the *Garde Nationale et Nomade* of some 4000, and the *Compagnies Tchadiennes de Sécurité* of some 950.

RECRUITMENT, TRAINING AND RESERVES

The army in the Tombalbaye period recruited in the south, in particular from among the Sara, Tombalbaye's own ethnic group. The post-coup government has been attempting to make the army more representative of the nation as a whole. A random system of obligatory military service for 3 years exists.

The French have trained the Chad army since independence; mention has already been made of the limited Israeli and U.S. help. The French training mission of 'technical assistants' already noted remains, and the 1976 agreement gives France in return certain aircraft staging rights. These proved important for French support for President Mobutu in March, 1977.

EQUIPMENT AND ARMS INDUSTRY

Chad is equipped with mostly French military equipment. This includes infantry weapons, Panhard AML H60 armoured cars and 120 mm and 81 mm mortars. The air force has a small number of U.S. Skyraider aircraft, together with French transports and helicopters. However, some evidence suggests that, surprisingly, the USSR has provided Chad with small quantities of mortars and APCs — the only reason that can be surmised is a wish to acquire some influence and prevent Libya from gaining a completely free hand. Recently rumours have also suggested the despatch of U.S. military equipment. Egypt is strongly sympathetic to the Chad government and has, it seems, influenced the American Carter administration.

RANK, DRESS AND DISTINCTIONS

These generally follow the French pattern, although the *képi* is replaced by a peaked cap.

CURRENT DEVELOPMENTS

No easy or quick solution seems possible for Chad, except in the negative sense that any withdrawal of French support would lead to an almost immediate total collapse. To an already poor area has come prolonged war and the Sahel drought. Economic exhaustion may prove decisive; it has already forced the Chad government to abandon any hope of regaining the potentially uranium wealthy Bardai and Aouzou areas in the north. It appears that only anxiety over the Muslims resident in N'Djamena has so far prevented FROLINAT from engaging in urban terrorism — this could prove a *coup de grace* for

Chad

Chad. The whole future of the Chad State seems increasingly to be in doubt, and the Soviet-supported Libyan design of a belt of revolutionary Arab/Berber and Sahel radical States from Libya to the Atlantic a degree more probable.

ANON.

CHILE

HISTORY AND INTRODUCTION

The history of the Chilean army differs from that of most other Latin American armies in two important respects: its victories in campaigns fought since independence have been the means of adding greatly to the national territory; and, for the greater part of its existence, it has remained obedient to the control of elected civilian governments. All the more surprising, therefore, has been its assumption, with the other armed forces, of governmental powers since 1973.

The Chilean army traces its origins to the opening battles against Spain in 1810–14. A remote frontier province of the Spanish empire, isolated by the Andes to the east, desert in the north and unsubdued Indians (the Araucanians) in the south, Chile easily expelled the colonial administration in 1810 but its tiny volunteer army, led by Bernardo O'Higgins, was easily overcome by a Spanish army of reconquest at Rancagua in October, 1814. O'Higgins took its remnants to join San Martín at Mendoza in Argentina, with him recrossed the Andes and at Chacabuco in February, 1817 and Maipú in April, 1818 fought the battles which established Chilean independence for good. A hastily created Chilean navy, commanded by the cashiered British admiral Cochrane, then played the decisive role in expelling Spain's last army in the Americas from Peru. By then O'Higgins had been overthrown as national leader by another hero of the independence campaign, Freire, who became the central figure in a struggle for power between the regions and the capital, Santiago, which lasted from 1823 until 1830. It was ended by the defeat of Freire at Yircaj in April, 1830 which established in power a centralising faction of great landowners, led by Prieto and Portales. They made it their first concern to rid the country of military factions and to unify the army, and then to promulgate an effective constitution, so successfully in the latter respect that it remained in force until 1925.

They were also successful in their military policies. The military academy (*Escuela Militar*) was founded in 1832, and from it the army increasingly drew a steady supply of professionally trained officers, thus avoiding the troubles suffered by so many other Latin American countries at the hands of self-made or politically appointed officers. As a counterweight to the army a provincial militia, the *Guardia Civil*, officered by the wealthy classes, was also created in 1832, but proved superfluous. The purged army displayed from the start an admirable loyalty to the government and, within 6 years of Prieto and Portales coming to power, refreshed its reputation as the source and guardian of national independence by its conduct in the war of 1836–9 against the Confederation of Bolivia and Peru. The murder of Portales by a Chilean renegade made the war a popular issue and the eventual victory of the army, under General Bulnes, at Yungay in January, 1839 was hailed as a 'Second Independence'.

Bulnes and his successors ruled Chile without serious internal dissent for the next 50 years. The role of the army during this era of the 'Autocratic', and later the 'Liberal' Republics, was strictly external. The short-lived and long-range war against Spain, in 1866, in alliance with Ecuador, Peru and Bolivia, involved only the navy. But in 1843 the army embarked on the penetration of the far south, where the Araucanian Indians remained unsubdued, British and French ships were reconnoitring the coast, and the frontier with Argentina was undelineated. Under the protection of the army, settlers began to occupy land around Valdivia, many of them Germans who were in years to come to make an important contribution to Chilean life. The pacification culminated in the Araucanian rebellion of 1859–61 and was only completed in 1883, when the Indians of the south and the Santiago government signed a treaty establishing the integrity of the tribal lands, by then much reduced in extent. Meanwhile the army had fought a regular and even more important war against the country's northern neighbours, Peru and Bolivia, over possession of the newly discovered mineral wealth of the desert provinces of Antofagasta, Tarapacá, Tacna and Arica. Unregarded until the 1860s, the provinces were then assigned by Bolivian-Chilean agreement to administration by the former, while Chile was granted favourable terms to exploit the nitrate deposits. In 1878 a new ruler of Bolivia abrogated the agreement, with Peruvian endorsement, and in 1879 Chile put the issue to the test of war. The ensuing War of the Pacific, the most important internal war fought in South America, began badly for Chile, who was defeated at sea, but her acquisition of a modern ironclad quickly gave her back naval primacy. On land her army defeated the Bolivians at Tacna in 1880 and the Peruvians at Miraflores and Chorillos later in the year. Lima was occupied in January, 1881. The Peruvians insisted on maintaining resistance in the mountains for another 2 years, but were brought to make peace in 1883. That treaty, and another signed with Bolivia in the following year, consigned all the disputed territory to the victors, deprived Bolivia of her access to the sea, and left Chile the dominant power on the Pacific coast.

Her military superiority was shortly to be reinforced by the activity of a remarkable foreign military adviser, the Prussian Emil Koerner, who arrived at the invitation of the Minister of War in 1886 to reform the *Escuela Militar*. Koerner quite quickly established his ascendancy over the whole Chilean military establishment and when in 1891 a disputed presidential election divided the army he became head of the rebel general staff. Their victories at Concón and Placilla were effectively his achievement. This short and unbloody civil war established Congress, dominated by the land-owning, commercial and

mining interests, as the leading power in the State, replacing the hitherto paramount presidency. It also gave the army a reminder of the power it possessed to determine the course of national politics, in which it had not seriously intervened for 60 years. But its immediate effect was to accelerate the Prussianisation of the officer corps. In November, 1891 Koerner became Chief of the General Staff, a post he retained until 1910, and he used his office not only to introduce German military training methods, instructors, uniforms and organisation, but also to foster that spirit of military self-importance which was such a baleful influence on the politics of his homeland.

The Prussianised Chilean army became a model for others in Latin America. Its officers were sought after as instructors by the armies of Ecuador, Venezuela, Colombia and El Salvador, while the obvious superiority of their professional knowledge led Argentina and Bolivia to go directly to Germany for military tutorship. But the congressional government which the army had established served its sponsors badly. The services were neglected throughout the first two decades of the century, which also saw the collapse of the nitrate industry as the result of the development of a synthetic substitute by European firms, upon which Chilean prosperity depended. By 1920 both the army and the electorate were disaffected from the oligarchy which controlled the congressional system, and 12 years of unhappy and complex politics, dominated by military intervention, were to result. Alessandri, a political leader from the nitrate fields, was elected President in 1920 but failed to pass his progressive legislation through the oligarchic congress. Its obstruction prompted a group of young officers, broadly sympathetic to his policies and hostile to the selfishness of the entrenched property-owners, to engineer a coup which brought him by roundabout means back to power in 1925. With the assistance of the leading soldier-politician, Colonel Ibáñez, he promulgated a new constitution, which legalised trade unions and introduced a social security system, but, on the termination of his presidency, power passed to Ibáñez himself who became President by the resignation of his own puppet in 1927. By purging the army and borrowing abroad, Ibáñez sustained himself in power until the effects of the great depression were experienced in Chile in 1931. Ten different administrations held office in 1931–2, the last a so-called Socialist Republic led by an air commodore of Anglo-Saxon descent, Marmaduke Grove. Its farcical demise consolidated a growing resolution in the armed forces to disentangle itself from politics, with which they had nothing more to do for 40 years. The re-emergence of Ibáñez, who became President in 1952, was of personal, not institutional, significance.

Its apoliticality survived the appearance of a Popular Front government in 1938, the reappearance of Ibáñez and a strongly reformist Christian Democrat government in 1964. The election of President Allende at the head of a Marxist-inclined Popular Unity government in 1970 reawoke, however, the armed forces' political concerns. Despite the attested sympathy of many officers for the Chilean underprivileged, and their lack of patience with the vested interest of the landowning and industrial oligarchy, their strong nationalism would have no truck with the threat of foreign intervention — Soviet or Cuban — which the Allende regime presented, while their instincts for order were affronted by the continuous industrial strife which Allende's expropriatory policies generated. Chile's besetting inflationary difficulty became uncontrollable in 1973, middle-class anti-government strikes became continuous and on September 11th the armed forces unleashed a coup. President Allende was killed (or committed suicide) in the presidential palace and a *junta*, headed by the Army Commander, General Pinochet, took power in his place. Congress was suspended and the *junta* announced its intention to govern by decree. This combined action by the army, navy, air force and police, who had not hitherto always found it easy to agree either on service or on political issues, was in itself evidence of the degree to which Allende had united opposition to his government. And it was further evidence of the hesitation which the forces had had to overcome before moving against him that his two last cabinets had included representatives of all the services, who had joined it in an attempt to help his government ride out the storm by making a common front to prevailing economic and social difficulties. In so doing, the armed forces were acting very much in the spirit of their traditions. It is the policies of the military government since the coup, in particular its declaration of intent to retain the reins of power, which mark a new departure.

STRENGTH AND BUDGET

Population: 10,940,000

Army: 50,000

Navy: 24,000 (including 3800 marines); 18 major vessels, 17 smaller

Air force: 11,000; 70 combat aircraft

Paramilitary: 30,000 State Police (*Carabineros*)

GNP:

Defence expenditure: } inflation makes figures unreliable

In the period 1953–66, Chile benefited particularly generously from United States military aid, receiving in military grants and surplus stocks assistance second only to that given to Brazil and, in *per capita* terms, more than any other Latin American country. Most of the money and equipment went, however, to the navy and air force. Internal spending was also less generous to the army; its share of the defence budget declined in the 1960s while that of the other two services rose. Under the Allende government, the share of the budget devoted to the armed forces rose slightly, and the army benefited thereby. Subsequently the level of inflation (about 600% at its worst) makes computations about the level of military spending difficult.

World Armies

COMMAND AND CONSTITUTIONAL STATUS

Article 71 of the 1925 Constitution, still technically in force, allots to the President the responsibility of preserving internal law and order and assuring the national defence. He is Commander-in-Chief of the Armed Forces, and may command directly with the approval of the Senate. As Commander-in-Chief he is advised in military affairs by the Supreme Council of National Security, which consists of the Ministers of National Defence, Foreign Relations, Finance, Development, Economics and Reconstruction; by the Commanders of the Army, Navy and Air Force; and by the Chief of the National Defence Staff. In time of peace, control of the armed forces is vested in the Minister of War, who is advised by the National Defence General Staff. He deals directly with the commanders of the services. The office of the Commander-in-Chief of the Army consists of his deputy, chief of staff, and three staff sections, organised on the German pattern: (1) operations; (2) intelligence; and (3) personnel and logistics; there is also a training section. The Inspector-General of the Army is separately subordinate to the Commander-in-Chief.

Since 1973 command of the armed forces has been exercised by the ex-Commander-in-Chief of the Army, General Pinochet, first as Head of the *junta*, then as Supreme Head of State and, since December, 1974 as President (by his own decree). Congress has been abolished, and the *junta* acts as the legislature. An 18 man Council of State, to act as a consultative body, was created in January, 1976 but the armed forces, meaning largely in practice the army and *Carabineros*, exercise power directly and without civilian supervision or check. The 'state of siege' declared on September 11th, 1973 is still in force and though President Pinochet promulgated on the third anniversary of the coup a constitutional guarantee of the rights of citizens, he accompanied it with an extension of the states of emergency which the government might declare, including a 'state of latent emergency'. The remaining non-Marxist political parties were dissolved in March, 1976 and it is the armed forces' declared intention to retain power for the foreseeable future, until prosperity has been restored and the danger of a Marxist return extinguished.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

The 1925 Constitution declares the tasks of the armed forces to be the defence of the national territory and the preservation of internal law and order, under the authority of the President. Since 1973, and very much against the traditional pattern of Chilean politics, the armed forces have ruled directly.

The army is not committed to any external role, and is bound only by the normal South American military treaties (Chapultepec Mutual Defence Pact of 1945 and the Rio Defence Pact of Non-Aggression of 1947). Like most other Latin American countries, Chile is also the signatory of a Military Assistance Pact with the United States (April, 1952) by which she promises to render access to raw materials and support in defence of the hemisphere in return for American military protection. Chile has benefited particularly generously from American equipment and military aid deliveries.

The country is nevertheless in dispute with Bolivia and Argentina, and potentially with Peru, over borders, and its troop deployments reflect these disputes. The country is divided for military purposes into six divisions (also known as Internal Security Complexes) thus (from north to south): 6, HQ Iquique; 1, HQ Antofagasta; 2, HQ Santiago; 3, HQ Concepción; 4, HQ Valdivia; and 5, HQ Punta Arenas. Divisions 6 (bordering Peru and Bolivia) and 5 (where Chile is in dispute with Argentina) are disproportionately well-garrisoned. So too is Division 2, containing both Santiago, Valparaíso and the main military training centres.

The army has been involved in no serious military action since the War of the Pacific, unless the short civil war of 1891 is included. Anti-terrorist operations following the 1973 coup have been conducted at a police level.

ORGANISATION

Arms of Service

The army is organised into cavalry, infantry, armour (*Blindados*), artillery, engineers (*Zapadores*), signals (*Telecomunicaciones*), transport, ordnance (*Material de Guerra*), maintenance, administration (*Intendencia*), justice, medical, veterinary, chaplain and band branches. Many of the infantry, cavalry and artillery regiments are of long standing and bear traditional or regional titles (e.g. the Granaderos and Cazaderos cavalry regiments, Tacna and Buin infantry regiments). It is unclear whether the parachute and special forces (*Fuerzas Especiales*) units are independent or belong to another branch.

Operational

There are three armoured, three cavalry, one heliborne and 20 infantry regiments; nine of the infantry regiments are motorised and three mountain, and some of the infantry regiments may have more than one battalion. There are six artillery regiments. Operationally the army is organised in six divisions, each of which has a divisional headquarters and the operational strength of a brigade, with three or more infantry battalions, an artillery regiment, a cavalry or armoured unit, engineers and support units.

The Federal Police (*Carabineros de Chile*), 30,000 strong, are the only police force of significance and are under the central control of the Minister of the Interior (in April, 1974 control was transferred by decree to the Defence Minister). In cases of grave emergency they become subject to a presidentially appointed *Jefe de Plaza*, the senior local army officer, who takes charge of all public forces. If the emergency is civil he reports to the Minister of the Interior, if military to the Minister of National Defence. Such a 'state of siege' is now in force.

The navy's marines (*Infantería de Marina*), 3800 strong, form a brigade; the navy has seven landing ships or craft for its movement. The air force has an air-defence battalion.

RECRUITMENT, TRAINING AND RESERVES

By the Obligatory Service Law of 1900, which was modelled on current German legislation, all Chilean males become eligible for service at the age of nineteen. The term of service is 1 year, though in practice conscripts are released after 9 months. By recent decision, 10% of those conscripted must be illiterates, military service being seen as one of the most effective means of combating illiteracy, which is still over 10% in the country at large. The annual contingent numbers about 30,000, of whom about two-thirds are selected, by lottery. Training is conducted in the units to which conscripts are assigned. Three-fifths of the army is composed of volunteers, who may be trained at the army schools.

Officers are recruited from high-school graduates, and receive 5 years' training (three academic, two military) at the *Escuela Militar*, Santiago (founded 1832). Superior training is given at the Staff College (*Academia de Guerra*), Santiago; there is also a tri-service/civilian war college, *Academia de Defensa Nacional*, at Santiago, attendance at which is necessary for promotion to senior ranks. Military engineer specialists are trained at the *Academia Politécnica Militar*, Santiago. There are several arms schools: Infantry (San Bernardo, near Santiago), Artillery (Linares), Armour (Quillota, near Valparaíso), Engineer (Tejas Verdes), Signals (Santiago), Mountain (Río Blanco), Parachute and Special Forces (Colina Air Base, Santiago); the Sergeants' and Soldiers' Specialists' Schools are at Santiago.

Chile's military academies have a high reputation in South America and students come to them annually from El Salvador, Ecuador, Honduras, Dominican Republic, Paraguay and Venezuela. Chilean officers also regularly attend the United States School of the Americas, Panama Canal Zone, and the Inter-American Defense College, Washington, for reasons of diplomacy rather than necessity.

The Obligatory Service Law consigns ex-conscripts to 12 years' service in the active reserve and thirteen in the second reserve, to the age of forty-five. The effective size of the army reserve is said to be 160,000. Estimates vary, however, and there is no evidence that reserve formations are effective or that reservists receive useful refresher training.

EQUIPMENT AND ARMS INDUSTRY

Although a highly industrialised State, by South American standards, with one-sixth of the workforce employed in manufacturing, Chile does not have an arms industry. Explosives and small-calibre ammunition are produced locally. Weapons and military equipment are imported, chiefly from Western Europe and America. Some Soviet weapons were imported during the Allende presidency.

Rifle: 7.62mm FN (Belgium) and 7.62mm SIG (Switzerland)

Machine-gun: 7.62mm FN (Belgium) and 7.62mm MG42 (Germany)

Mortar: 60mm M19 (USA), 81mm M1 (USA) and 120mm Brandt (France)

Anti-armour weapons: 106mm M40 RCL (USA)

Air-defence weapons: 20mm Oerlikon (Switzerland) and 40mm L/60 Bofors (Sweden; USA)

Artillery: 105mm pack howitzer (Italy) and 105mm M101 howitzer (USA)

Armour: M-113 APC (USA), Mowag MR-8 APC (Switzerland), Sherman tank (USA; obsolete) and M-41 tank (USA; obsolete)

Aircraft: 14 helicopters; the air force operates another 26 helicopters and about 40 military transport aircraft suitable for parachuting

RANK, DRESS AND DISTINCTIONS

General de División	Three stars on shoulder boards
General de Brigada	Two stars on shoulder boards
Coronel	Three stars on shoulder plaits
Teniente Coronel	Two stars on shoulder plaits
Mayor	One star on shoulder plaits
Capitán	Three stars on shoulder straps

World Armies

Teniente 1	Two stars on shoulder straps
Teniente 2	One star on shoulder straps
Suboficial Mayor	Three gold stripes
Suboficial	Two gold stripes, star
Sargento 1	Two gold stripes
Sargento 2	One gold stripe
Cabo 1	Two red stripes
Cabo 2	One red stripe
Soldado 1	One star, one bar
Soldado 2	One star

At the turn of the century, the Chilean army was dressed in Prussian-style complete. Its combat dress is now of American cut, but the army has retained its field-grey colour. Ceremonial uniforms are still Prussian. There are at least 10 military orders and decorations. The army goosesteps on ceremonial occasions.

CURRENT DEVELOPMENTS

Despite unmistakable evidence of disaffection from the Popular Unity Government over a wide spectrum of society, the military coup of 1973 attracted obloquy from progressive and left-wing opinion throughout the world. More general disquiet was voiced at the news which followed in the wake of the coup of the harshness of measures taken against Allende's supporters. By the military government's own account in October, 1975 it still held over 4000 detainees either awaiting trial or without charge and, a year before, had held 10,000. It was also disquieting that in March, 1976 the 'state of siege' instituted at the moment of the coup was again extended, and all remaining political parties, including those of the centre like the Christian Democrats, who had pledged their support to the government, were disbanded, as those of the Popular Unity Alliance had already been. In January, 1976 the Chief of Staff of the Armed Forces, General Stark, was obliged to resign, apparently in consequence of protests he had voiced the previous month, with 10 other generals, at the harsh effects of the government's deflationary policies on the poorest classes. General Pinochet, who had become President by decree in December, 1974 appeared unmoved by this opposition from within the ranks of the armed forces. On the third anniversary of the coup, he announced his programme of 'Authoritarian Democracy', by which legislative power would be vested in the *junta*, executive power with the President, and only the judiciary remain independent. The aim of the regime would be to create conditions of political and economic stability such that the 'sectarianism' and 'chaos' of the Allende years could not recur.

JOHN KEEGAN

PEOPLE'S REPUBLIC OF CHINA

HISTORY AND INTRODUCTION

The formation of the Chinese People's Liberation Army was announced by Mao Tse-tung in July 1946, by which time regular communist armed forces had been in existence for some 19 years.

After the collapse of the Manchu dynasty in October, 1911 northern and central China steadily became ungovernable, despite attempts at military dictatorship and then imperial restoration by the warlord Yuan Shih-k'ai. In southern China, based on Canton, two radical movements emerged. The first was the Kuomintang (KMT), a movement initially committed to the principles of liberal democracy and social reform led by Dr Sun Yat-sen until his death in 1925, thereafter dominated by the Generalissimo Chiang Kai-shek. The communist party of China (CPC) was founded in 1921. In 1923, following advice from the Comintern and the Soviet regime in Moscow, it formed a United Front with the KMT. The communist intention was to assist the KMT in its plans to overthrow the warlords who had reduced much of China to chaos, and unite the country under a strong central government. At the same time the CPC would infiltrate all the organs of the KMT, and ultimately transform it into a vehicle for a Marxist revolution in China. In view of these intentions, the CPC did not create a revolutionary army of their own, but set about gaining influence and control within the KMT forces. Dr Sun Yat-sen adopted Bolshevik forms of organisation (but not Bolshevik political objectives), and many communists became political officers attached to KMT units. They also took great interest in the process of political indoctrination carried out at the Whampoa Military Academy, the training school for KMT officers.

In 1926 the KMT army embarked upon the 'northern expedition', a strategic offensive to put down the squabbling cliques of warlords that culminated in the capture of Peking in 1928. The 4th Corps of the KMT army, called the 'Ironsides', consisted of some 30,000 Cantonese, and had been heavily infiltrated by the CPC. As the 4th Corps moved northwards, its communist members organised the peasants, setting up Peasant Associations, and encouraging them to attack or intimidate landlords into redistributing their lands, or reducing rents. By the spring of 1927 there were 50,000 Ironsides of whom some 30% were committed to the communist cause.

In the spring and summer an ideological split emerged in the KMT, between a right-wing faction led by Chiang Kai-shek based on Shanghai and a left-wing faction based on Hankow. The CPC supported the Hankow faction. Chiang triumphed, the Hankow faction submitted and abandoned their communist supporters. The right wing purged the KMT of its known CPC members. The response of the CPC Central Committee was to order a series of urban uprisings.

On August 1st, 1927 there was a communist rising in Nanch'ang. The communist forces consisted of the 'Ironsides', a proportion of the garrison of the city (which consisted of KMT officers cadets, led by their commander, Chu Teh, formerly an officer in the army of the Warlord of Yunnan), and a ragged force of peasants, KMT deserters, and strikers from the Hanyang coal mines, led by Mao Tse-tung. Chu Teh proclaimed the foundation of the Red Army, and Mao named his followers the '1st Workers' and Peasants' Red Army'. These events marked the emergence of the first distinct communist armed forces in China.

The Nanch'ang rising had little success, and indeed from 1927 until 1937 the Red forces in China had little respite from a constant round of defeat and retreat. They could do nothing in the face of superior enemy forces but survive, prepare for the future, and lay the foundations for an enduring romantic legend.

As KMT reinforcements moved on Nanch'ang the Red troops, having failed to gain the expected degree of support from the urban proletariat of the city, retreated. Attempts to inspire or support urban uprisings in Canton, Shanghai and other cities failed, and by late in 1927 the forces of Chu and Mao, much depleted by enemy action, disease, starvation and desertion, took refuge in Ching kangshan, a mountainous wilderness, where they merged their troops with those of indigenous bandits. From Ching kangshan they set out to politicise the local peasantry, and set up a soviet.

In June, 1928 the Comintern and the 6th National Congress of the CPC approved the formation of the Red Army. By this time there were at least eight soviets, most of them ephemeral, in existence in China, and all had forces of a sort. The most substantial were at Ching kangshan, where Mao and Chu commanded some 10,000 men and women, of whom approximately 2500 were armed.

Early in 1929 Mao and Chu were forced to evacuate Ching kangshan by an effective KMT blockade that starved them out. On the move, southwards, they relied upon peasants to supply their food, fill up the ranks with recruits, and give intelligence as to the activities of hostile forces. Such support was secured by the usual political activity, the most popular form of action being attacks upon the landlords and their militia, the Min Tuan, in order to obtain arms and rice. The retreat from Ching kangshan ended in south Kiangsi, after the pursuing forces had run out of steam. The Reds settled down to construct a soviet.

In the meanwhile, the senior CPC members with the Red Forces had discussed military policy in conference at Kut'ien. Here it was agreed that the Red Army must at all times accept the absolute authority of the CPC, and the principle of

World Armies

political control was established. But, there were disagreements over strategy and tactics; Mao denounced Red Army commanders, many of whom had been trained in warlord armies under Japanese or German influence, as 'bourgeois militarists', and called upon them to abandon conventional military operations for guerrilla activities in order to ensure survival.

In 1930, there were further disputes over strategy. The Central Committee of the CPC ordered new attacks on cities in order to spark off an urban revolt against the KMT. Mao believed such attacks would fail, would be costly, and would induce no useful response from the urban populations. He favoured continued guerrilla and political activities designed to gain support from the peasants and so gain control of the countryside. Despite his arguments, formal assaults were made on a number of cities held by the KMT. Some were temporarily successful, but once the KMT responded cities captured by the Reds were quickly lost. The workers failed to rise in support. The attacks did little but provoke a vigorous counter-attack by the KMT.

Between the autumn of 1930 and the autumn of 1934 the KMT launched five 'encirclement campaigns' against the Reds. These campaigns were intended to annihilate the CPC. The Reds fought all but the last in conventional manner with their permanent forces, and relied upon sympathetic peasants behind the KMT lines to supplement their regular operations with guerrilla attacks. The Red forces had some success, and some good luck too. On occasions they could 'lure deep' an enemy formation; by pinprick attacks from many directions anger the enemy commander so that his troops could be drawn, over-extended, isolated, exhausted by long marches, then ambushed, or encircled and assaulted. In this way the Red forces obtained weapons, ammunition and equipment. In 1932 the Reds launched an effective pre-emptive spoiling attack upon the surrounding KMT forces. In 1931, they were saved by the repercussions of the Mukden Incident, that distracted the attention of the enemy commanders. Red political activity continued to be effective, even amongst enemy forces. In 1931 a brigade from the army of the 'Christian Warlord' Feng Yu-Hsiang defected to the Reds, and in 1932 the KMT 28th Route Army of some 20,000 men did the same. By summer 1933 the Reds had sufficient trained men to allow a reorganisation of forces in which they created 'divisions', each of some 6000 men, organised on a triangular basis.

In October, 1933 KMT forces launched the 5th encirclement campaign against the Kiangsi soviet. By September, 1934 they had reduced its area by half. Red Forces found it increasingly difficult to evade strong KMT columns, and when Red units fought KMT units at equal odds, they were always defeated. Also, the soviet could no longer feed its inhabitants. Mao and Chu decided that they must break out and go to find a more inaccessible and more secure rural base area elsewhere. Accordingly, they broke out, not without loss, and having left a stay-behind party in south Kiangsi to carry on political and guerrilla work, moved south-west. Red forces in the Hsiang-o-hsi soviet in west Hunan and west Hupei, and in the Oyuwan soviet in the Ta-pieh-shan mountains, were ordered to join them. In this way the Red Army commenced the 'long march', which was performed by three separate columns. All of them suffered great privations on their journeys, which were 6000-8000 miles in length, and great loss due to severe climatic conditions, rough terrain, shortages of food, and action by hostile KMT, warlord and tribal forces. The column from south Kiangsi was almost pinned on the Yangtze, and then on the Tatu, by pursuing enemy troops.

The Red forces eventually concentrated in north Shensi in autumn, 1936 where they set about the creation of a defensive base area. Some 35,000 regular Red troops were formed into seven 'divisions' and deployed to defend the base should it be attacked. Guerrilla forces were sent out beyond the base area to enlarge it by political activity.

Meanwhile, Chiang Kai-shek laboriously deployed KMT and allied warlord units so as to encircle the north Shensi soviet, and prepare to reduce it. However, the Reds managed to persuade many of his senior commanders that the KMT should form a united front with Red forces in order to repel the Japanese, who by December, 1936 were reinforcing their troops on the outskirts of Peking. In December, 1936 Chiang arrived at Sian to supervise the extermination of the north Shensi soviet. He was kidnapped by senior officers led by Chang Hsueh-liang, warlord of Manchuria, and forced to accept a united front.

So, in 1937 the Red forces in north Shensi formed the KMT 8th Route Army, an army of three divisions. In September, 1937 the 115th division commanded by Lin Piao ambushed a Japanese mechanised column at Ping Sing pass, and as a result furnished the Red Army with 50 field guns, their first substantial body of ordnance. Apart from this exploit, which was used to the utmost by CPC propaganda, the Reds did little fighting against the Japanese until 1940. Until then the 8th Route Army stood ready to defend the base area, guerrillas concentrated their attention upon landlords and KMT irregular forces, and CPC work teams encouraged the peasants to arm and organise themselves into local self-defence corps. In April, 1938 the activities of the 8th Route Army were supplemented by those of the KMT New 4th Route Army, a communist force of divisional size located on the southern bank of the Yangtze.

In summer, 1940 the Reds launched the '100 Regiments Campaign', which was their only large-scale offensive against the Japanese invaders. Approximately half a million Red soldiers took part. Activity was concentrated in northern China. Red troops assisted by peasants mobilised by local CPC members and political officers of the Red Army first wrecked roads, railways and bridges, then attacked isolated Japanese posts. The second phase was more difficult and had less success than the first. The Japanese responded in the period between summer, 1941 and summer, 1942 by the 'Three All' campaign, based on the principles of 'kill all, destroy all, burn all'. The Japanese did not attempt to pursue Red forces and bring them to battle, instead they controlled, reduced and punished the rural population upon whom the Red troops relied for intelligence and logistic support. Their campaign was a great blow to the Reds, and from 1942 until the Japanese surrender of 1945, they reverted to low-level guerrilla and political activities directed against the KMT, Min Tuan and collaborationist 'puppet

troops'. Meanwhile, in spring, 1941 the KMT, losing patience with the failure of the Red forces to make suicidal attacks upon the Japanese, and with their continued political action in the countryside, broke up the United Front by attacking the New 4th Route Army.

By summer, 1945 the Red forces had grown in size, and large areas of countryside were sympathetic to the CPC, especially in northern and central China. In August, 1945 the Japanese surrendered, and the Reds instantly went into action. The 8th Route Army increased by calling up half-trained peasants from 400,000 to 800,000 men in a few weeks; the New 4th Route Army increased from 80,000 to 110,000. The Red forces were reorganised for the civil war. Eventually the regular elements fought in five field armies, each one of which acted within a distinct and usually independent theatre of operations. In the initial phase of the civil war the Reds created a new army, the 4th Field Army, which was sent north under the command of Lin Piao to seize Manchuria, the main industrial base area of China. The Second and Third Field Armies moved into central and northern China to obstruct the advance of KMT forces coming from the south-west. They tore up roads and railways to deprive the KMT of the advantages of having motor transport and locomotives. The Reds armed themselves and new recruits at the expense of the defeated Japanese. All over central and northern China columns of disconsolate Japanese soldiers, stripped to their loincloths by destitute Red soldiers, trailed north-eastwards. In Manchuria, with some assistance from the Soviet occupation forces, the 4th Field Army acquired medium artillery and tanks. These unfamiliar weapons had at first to be operated by Japanese prisoners; they were later worked by deserters from the KMT armies.

Meanwhile the KMT forces fought their way northwards, with American help, and soon appeared to be in possession of the whole of China. But, although the KMT garrisoned great cities and towns, and patrolled major lines of communication, it could not catch and annihilate the Red forces, or control the countryside. The communists surrounded, isolated and starved towns, and when relief columns were sent they ambushed them or stopped them by blocking the roads. They also swiftly surrounded and wiped out KMT units whenever they were able to concentrate decisively superior forces. By summer, 1947 the KMT forces, affected by internal political dissension, were weary and demoralised, made fatalistic and defeatist by CPC propaganda, and the PLA went over to the offensive. Slowly, one by one, the cities in Manchuria were taken, by blockade, bombardment and massed infantry assault. Each communist victory brought in floods of recruits, many of them deserters or prematurely demobilised soldiers from the KMT army. By October, 1948 the five field armies were all well established and were all making successful attacks upon the KMT. In November, 1948 at the battle of Suchow, elements of several field armies co-ordinated operations to defeat the best of the KMT modernised divisions, and deal a deathblow to the military arm of Chiang Kai-shek's regime. In January, 1949 the Peking—Tientsin pocket fell, and in April, 1949 Red forces crossed the Yangtze almost unopposed. Chiang K'ai-shek and the best of his remaining forces fled to Taiwan as the PLA mopped up in the South and south-west. On October 1st, 1949 the Chinese People's Republic was proclaimed.

At that point the PLA was transformed; it was no longer purely the military arm of the revolutionary movement — it took on the new role of an instrument of state obliged to defend national interests. The first commitment was to complete the destruction of the enemy, and this entailed pursuit and annihilation of the KMT forces on Taiwan. However, amphibious assaults on Quemoy and Matsu made by units of the 3rd Field Army, were repulsed with great loss. Attempts to reach Taiwan itself were swiftly ruled out by American naval measures.

Another commitment was to reestablish Chinese control over certain peripheral areas, and in particular, over Tibet. Action was taken in summer, 1950. Five divisions of the 2nd Field Army and two of the 1st Field Army moved into Tibet and quickly induced the Dalai Lama to submit to the authority of Peking.

Meanwhile, an apparent threat to the security and integrity of metropolitan China arose as a result of the progress of the UN forces in Korea. As a result of this perceived threat the PLA crossed the frontiers of China for the first time, encountered fully equipped modern forces with catastrophic casualties as a consequence, and in an effort to modernise itself came for a number of years under strong Soviet influence.

In autumn, 1950 some 300,000 Chinese Peoples' Volunteers (CPV), drawn mainly from the 4th Field Army, secretly crossed the Yalu and prepared to counterattack the advancing UN forces. The attack had initial success, but at great cost, and was stopped by UN firepower in spring, 1951. The Chinese commanders discovered that in Korea they lacked the room for manoeuvre and support from the rural population that had guaranteed survival and success in China. They leaned heavily on the Soviet Union for weapons, equipment, training, organisation and doctrine. By 1953, when the Korean War ground to a halt, the CPV resembled a Soviet force on much reduced scales of equipment. There were some 21 Corps, each consisting of three infantry divisions, most having some integral field artillery, in Korea. In addition the CPV deployed nine artillery divisions, two tank divisions, and some 1800 modern aircraft. The last of the CPV left Korea in 1958.

Soviet influence persisted, with the PLA adopting many of the characteristics of a conventional army, until the Sino-Soviet relationship began to decay in the late 1950s. As Mao and his immediate followers prepared for the 'great leap forward', they decided to purge the PLA in order to make it once more an instrument of radical political change. An assault was made upon Soviet military ideas and forms of organisation in 1959. The need for modernisation and a formal rank structure was questioned and under the auspices of the 'officers to the ranks' scheme all officers were sent to serve as private soldiers for 30 days a year. Those who protested against such changes, including Peng Teh-huai, the Minister of Defence, were dismissed and purged. Lin Piao was made Minister of Defence with instructions to reawaken the revolutionary radical spirit in the PLA. Gradually the Soviet concepts instilled since 1951 were discredited and eradicated. Despite the internal

World Armies

turmoil, the PLA remained an effective military force, and proved the point by suppressing a revolt in Tibet in 1959, and soundly beating the Indian Army in a series of border clashes in 1962.

By 1964 Mao was satisfied that the PLA was once more fit to school the nation in revolutionary politics. He sent PLA propaganda teams into cities and villages to promote a 'learn from the PLA' movement, and to encourage the people as a whole to purge and revitalise the CPC. As the 'great proletarian cultural revolution' was launched in the mid-1960s, Red Guards were sent to help propaganda teams from the General Political Department of the PLA. Other units of the PLA were drawn into the political maelstrom, first the militia and local forces, which were closely connected with the local CPC leaders under attack by the radicals, then, as violent chaos ensued in parts of the country, main units of the ground forces. In autumn, 1966 revolutionary committees were set up to discharge the functions of local administration, the normal machinery having been discredited or destroyed during the purges. By summer, 1967 the PLA was in control of these revolutionary committees, and rapidly gained a predominance on CPC and State committees at all levels. At the behest of senior commanders the Red Guards were put down, and the Cultural Revolution brought to a close. In restoring order the PLA had gained power.

It is probable that an important motive for the intervention of the PLA was that the disruption caused by the purges and resistance to the purges imperilled the efficiency of the armed forces at a time when China seemed to be under dire threat from the Americans to the south, and the Russians to the north.

The PLA continued to consolidate its political position. In 1969 Lin Piao was named as Mao's political heir. In the same year the PLA engaged in a number of serious border clashes with Soviet forces, particularly along the frontier of Sinkiang and along the Ussuri river. In the latter area the PLA scored a notable propaganda victory in a clash at Chen Pao island.

In 1971 the political position of the PLA was seriously undermined by the death, in mysterious circumstances, of Lin Piao. He was killed whilst fleeing by air towards the northern frontier of Manchuria. He had subsequently been accused by official Chinese sources of planning a *coup d'état* and the assassination of Mao. After 1971 the PLA gradually lost ground. CPC cadres replaced PLA commanders on vital committees. In 1973 most commanders of military regions were moved, thereby cutting them off from carefully nurtured local power bases. The military budget reached a peak in 1970, and then declined. In spring, 1976 Teng Hsiao-p'ing, who had been made PLA Chief of Staff in October, 1975 was removed from all his offices. The Minister of Defence, Yeh Chien-ying, came under political pressure and propaganda attack by radical elements once more attempting to push the PLA leftwards. However, in 1976 the PLA began a political resurgence. After the death of Mao in September the radical 'gang of four', led by Chiang Ching, attempted to seize power. The army gave firm support to Hua Kuo-feng who had been appointed Mao's deputy in May. In October Hua was confirmed as true legitimate successor of Mao. The 'gang of four' were subjected to increasingly intense criticism, arrested and expelled from the party, and then vanished to an unknown fate. The PLA suppressed disorders instigated in Shanghai and rural areas in the south by radical sympathisers.

In spring, 1977 Teng Hsiao-ping was gradually rehabilitated, and in July he was restored to office, including the position of Chief of Staff of the PLA. Under his direction the PLA is preparing to modernise, and to acquire weapons and armaments plant from foreign sources, including the EEC, to improve fire power and mobility.

STRENGTH AND BUDGET

The PLA ground forces maintain approximately 2,800,000 men in their regular units, of whom some 1,000,000 or so are deployed in independent divisions and regiments. The rest are organised in the corps of the main forces and supporting arms.

The main forces consist of some 11 armoured divisions, each with about 10,000 men. There are 121 infantry divisions, with a strength of some 14,000. There are three horsed cavalry divisions and 40 artillery divisions including air defence. Forty-one engineer and railway divisions provide transport and other forms of support.

The independent forces are organised into 70 divisions and some 130 regiments.

The ground forces are reckoned to have some 8500 tanks, 3600 APCs and 20,500 artillery tubes, of which 15,000 are 152 mm calibre or smaller.

The trained elements of the militia have strength of some 20,000,000, but of these only some 5,000,000–7,000,000 are armed. An urban Militia consisting of trade union members has a strength of several million.

The Production and Construction Corps have some infantry weapons, and are about 4,000,000 strong.

The Public Security Forces deployed as frontier guards are armed as light infantry and number some 300,000.

There are no reliable figures available as to the Chinese GNP or the Chinese military budget. Western estimates are for a GNP of about \$300,000,000,000 and defence expenditure of about \$23,000,000,000 to \$28,000,000,000.

COMMAND AND CONSTITUTIONAL STATUS

Command

The PLA is both the military instrument of the Chinese People's Republic, and as such the defender of Chinese national

interests as defined by the State; and the armed force of the CPC, and so the violent servant of a revolutionary political movement. The structure of command at all levels reflects the dichotomy in the character of the PLA. It is based upon two principles. The first of these can be summarised as the slogan 'politics in command', and was established at the Kut'ien Conference in 1929. It was reaffirmed in Article 15 of the Constitution of the CPR adopted on January 17th, 1975, part of which reads, 'The Chairman of the Central Committee of the Communist Party of China commands the country's armed forces'. The second principle derives from the first, and is that of 'dual command' — in effect, of joint control of military activities at all levels by political and military officials. Machinery for the exercise of dual command was created in 1930; a revolutionary military committee was set up to collaborate with commanders in strategic planning, and political commissars with powers to countersign all orders were sent to field units.

The system of dual command persists. Organs of the CPC are parallel to organs of State. The National Defence Council, the highest State institution concerned with defence, is watched and supervised by the Military Affairs Committee, a subcommittee of the Central Committee of the CPC which came into existence in 1949. These two bodies supervise the work of the Ministry of Defence. The Ministry is served by several departments; the Ground Forces General Staff, the General Rear Services Department (GRSD), the General Political Department (GPD), the Navy Department and the Air Force Department. The General Staff is organised along conventional lines, and is divided into subdepartments dealing with operations, intelligence, etc. Every department and subdepartment has a CPC committee within it. The General Staff exercises command over the military regions (MRs), military region HQs exercise immediate control over main force corps in their regions and supervise the work of subordinate military districts (MDs). Military districts control local forces, independent units of the regular forces, and paramilitary forces such as the Militia. HQs at military region, military district and corps level maintain close liaison with local CPC committees.

The General Rear Services Department supervises all work concerned with the supply and transport of the PLA. It directly administers or indirectly controls the production and distribution of centrally produced warlike stores, controls all large-scale movements of troops, and all major engineering and construction works. It supervises the activities of the Production and Construction Corps, and of the General Militia when engaged on production or construction tasks.

The General Political Department directs the work of the commissars with PLA units and also keeps watch on the political reliability of other departments.

During the 'great leap forward' the PLA extended its authority over Public Security Forces border guards, who were formerly under the command of the Ministry of Public Security. In the period of the cultural revolution the PLA took over the command of the People's Armed Police and the militia from local CPC organisations. These forces are now controlled by military district HQs.

The Urban Militia, a force originally raised by local CPC committees in 1968 as the Workers Provost Corps, is now under the control of trade union committees.

The actual application of the principles of 'politics in command' and 'dual command' at lower levels has varied with circumstances. Until 1949 the authority of commissars was enhanced by their operational value to commanders. By their political work commissars secured vital supplies, labour service, intelligence and fresh recruits from the peasantry. They also inspired loyalty, enthusiasm and self discipline amongst the soldiers of the Red forces. Discipline in Red Army units depended to a great extent upon political indoctrination, and was self-enforced at unit level. Every unit had a soldiers' council organised and led by CPC cells. These councils discussed the conduct of training and operations, and the behaviour of individuals at all levels, before and after action. When in action, soldiers were expected to render absolute obedience to the orders of a commander. Soldiers who were disobedient or hesitant in action were hauled before their unit Soldiers' Council at the earliest possible moment, and were often sent for execution. The task of the commander was thereby simplified; his work was simply to plan and execute operations or training schemes; administration and discipline were dealt with by the commissar and the soldiers themselves.

The power and status of commissars was greatly reduced as a result of PLA involvement in the Korean War. As the CPV adopted conventional operations, organisation and equipment under Russian advice, commanders became less inclined to allow commissars their previous right to examine, discuss and countersign operational orders. Commissars were no longer a vital link with the rural population, as the North Korean peasants failed to respond to their propaganda, and anyway, supply, discipline and administration were regularised with Soviet help. The system of dual command and politics in command was no longer in operation at unit level; commissars were regarded by their commanders not as equals, but as political assistants whose main role was to look after the morale and welfare of the troops. This attitude persisted after the major commitment to Korea ended. PLA commanders neglected political work in order to achieve a greater degree of technical military competence. CPC members within the PLA declined in numbers and lapsed into quiescence. By 1959 Mao was afraid that the PLA might lose its revolutionary character and become a bureaucratic instrument of the state rather than remain a militant arm of a revolutionary CPC. He acted to restore the importance of commissars and of the CPC within the PLA. Lin Piao became Minister of Defence, and worked to reinvigorate the communist movement within the PLA. By 1964 there was a CPC cell in 80% of the platoons of the PLA, and Mao considered that it could be used to guarantee a safe and successful purge of the civil CPC. Commissars were very active during the Cultural Revolution, but do not seem to have gained much power at the expense of commanders within the PLA itself. For a while their influence was greatly reduced after the PLA took political power and the General Political Department was thoroughly purged. It would appear that commissars are still unable to exert their claimed equal authority with commanders of an equal level

World Armies

when dealing with operational matters. But, they do wield great influence. They normally act as secretary to the unit CPC Committee which a commander will always consult before taking an important decision. They also perform certain important administrative functions; they carry out the political indoctrination of the troops; advise on promotions and postings; control resettlement; see to the morale and personal welfare of the soldiers; conduct security screenings; run military courts and boards; organise entertainments and unit newspapers; are responsible for psychological warfare in the event of war; and handle the business of civil-military relations.

Constitutional Status

The constitutional status of the PLA has been a matter of political contention. Since 1949 the PLA has always been available as a 'temporary reserve government' should the normal machinery of civil administration break down. In the case of the cultural revolution the PLA took over control, not only of the machinery of the state, but also that of the CPC.

Between 1949 and 1952 the PLA ruled China by martial law. But, in 1952 it handed over day to day business to civil authority. The principle of ultimate CPC authority was maintained until 1967; in 1959 the Minister of Defence, Peng Teh-huai was dismissed after a disagreement with Mao; in 1965 the Chief of Staff, Lo Jui-ch'ing was dismissed in similar circumstances.

However, the PLA always had great influence and political power, based upon the five field army connections, each of which had close links with a particular geographical area, and great influence over CPC leaders within it. It has been suggested that China is in informal terms a loose federation based upon these field army connections whose centres of power are: 1st Field Army, north-west China; 2nd Field Army, south-west China; 3rd Field Army, central and eastern China; 4th Field Army, Manchuria and Canton; 5th Field Army, north China, including Peking.

During the 'great leap forward' Mao showed a deep desire to purge the PLA of Soviet influences and ideas, make it an integral part of the Chinese masses, and draw it into Chinese political life. This desire was resisted by the regular forces of the PLA. But, during the cultural revolution the PLA regulars were drawn into political struggles in spite of their desire to abstain.

Having radicalised the PLA, and in particular the GPD, by 1964, Mao sent the commissars into the country to reform the CPC. By 1966 it was clear that the commissars had failed. Mao decided that a 'great proletarian cultural revolution' was required to reawake the Chinese revolution. He sent the Red Guards, some 50,000,000 students, to reinforce the commissars. The Red Guards were initially organised by the commissars, and were supplied and transported by the General Rear Services Department (GRSD). As the Red Guards began their assault on local CPC committees, local forces under MD commanders were drawn in on the side of local CPC branches. Main-force units were on the whole loyal to the central government, and some were politically radical, but they were concerned to maintain readiness against the Soviet and American external threats, and anxious not to be involved in domestic politics. In January, 1967 local forces were ordered by Peking to support the Red Guards, but apparently refused to do so. In response, the Red Guards criticised the PLA as a whole, which alienated some Main-force units. In April, 1967 the Red Guards attacked and destroyed local CPC branches and local government committees. Local forces of the PLA moved in an attempt to protect the local CPC and officials, and there were armed clashes with Red Guards. In the summer of 1967 the PLA main-force commanders decided that they could no longer tolerate the violent chaos that existed in many areas. In July, the senior commanders of the Wuhan military region captured and held three senior members of the Cultural Revolution Group from Peking, as a protest. In August, 1967 the PLA commanders induced the central authorities in Peking to order an end to the Cultural Revolution, and instruct the Red Guards to return home. PLA regular forces moved in to enforce these orders. PLA commanders took control of revolutionary committees and took over the administration of local government; a move which virtually made China a federal state in formal terms. PLA commanders also took control of national bodies, and gained power in the Central Committee of the CPC and the Politburo. The followers of Lin Piao's 4th Field Army were in a particularly strong position. In 1969 Lin was named as Mao's successor. The CPC was a military dictatorship at all levels; the PLA ruled the CPC.

However, the radicals, led by Mao, were absolutely opposed to 'military polycentrism' and set out to destroy it. By 1971 Lin's position was so weakened that he is said to have planned a *coup d'état* and the assassination of Mao. Whilst fleeing northwards with some of his senior cronies he was killed. The power of the PLA was swiftly reduced. In 1973 eight of the eleven MR commanders were moved away from their original MR and Field Army areas; their vital local political connections were broken and 'military polycentrism' was ended.

In the 5 years following the death of Mao the PLA has acted to consolidate its political strength and military prospects by supporting Hua Kuo-feng against the radical 'Gang of Four'. The CPC re-established civil control at local and national levels. The constitutional position of the PLA was defined in the Constitution of 1975 as follows:

'The Chinese People's Liberation Army and the people's militia are the workers' and peasants' own armed forces led by the communist party of China . . .'

The principle put forward at Kut'ien has been readopted.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

Article 15 of the 1975 Constitution of the CPR stated:

'The Chinese People's Liberation Army is at all times a fighting force, and simultaneously a working force and a production force.

The task of the armed forces of the People's Republic of China is to safeguard the achievements of the socialist revolution and socialist construction, to defend the sovereignty, territorial integrity and security of the State, and to guard against subversion and aggression by imperialism, social imperialism and their lackeys.'

This passage makes clear the fact that the PLA is not a purely military force; it is extensively used for economic purposes and plays a great part in production and construction work; it is also used for political work, such as the soldiers' education and indoctrination of the masses.

The extent to which the PLA should divert its energies from the military role in order to take part in the economic and political life of the country has been a matter of dispute. Career commanders have in the past protested that the involvement of the PLA in non-military work is inimical to military efficiency and readiness and so renders China vulnerable to external attack. The radical political elements in China, supported by Mao, have argued that the PLA must be fully integrated with the life of the masses in order to counter internal threats that are far more dangerous than external enemies. They also claim that invaders should be defeated by a 'people's war', and that success in such a war depends more upon the maintenance of popular support, and so on political work, than it does on the existence of highly equipped and trained regular forces.

Actual policy as to the role of the PLA is a compromise between these two points of view. The PLA main forces spend most of their time training and preparing to fight any invader on a conventional basis, and are being slowly modernised in their equipment. The local forces, regular and irregular, spend a great deal more time on economic and political work.

The primary role of the main forces, which are organised into corps and Armies under MR HQs, is to defend the territory of the CPR against invasion. Until the late 1960s the CPR believed that the main threat was of invasion by KMT forces from Taiwan, supplemented by American naval and air attacks. Since the late 1960s the CPR has regarded the Soviet Union and its Asian allies such as India as the main threat to Chinese security. The CPR now fears encirclement by the Soviet Union, and believes that the Russians may attempt to stir up rebellion by national minorities in peripheral areas of China, especially Sinkiang and Inner Mongolia. There is also considered to be a possibility of a Soviet conventional invasion against Peking from the Mongolian SSR, Chinese nuclear activities in Sinkiang, and the main Chinese industrial base area in Manchuria.

Maoists believe that the best way to defeat an invader is to resort to the strategy of 'people's war'. If such a strategy were employed, as invading forces advanced into China, PLA regular forces would withdraw to wage a protracted war. The enemy would occasionally be briefly attacked in order to draw him, so that his forces could be 'lured deep' into difficult terrain. The regular forces would defend rural base areas by blocking action, whilst guerrillas harassed enemy lines of communication. Eventually the enemy would be induced to disperse his units in a vain attempt to force elusive PLA forces to stand and fight. Then the PLA regular forces would use superior mobility on foot and superior intelligence to concentrate greatly superior forces in the vicinity of selected enemy units, isolate, encircle and annihilate them. Tactics would be simple and consist mainly of massed close assaults by infantry at night with artillery support. Military Regions would have considerable autonomy under such a strategy. In effect, the defence of China would be operationally decentralised. Logistics would also be decentralised; the PLA would rely on the friendly rural population to supply their needs.

But, it is unlikely that the main forces would resort to a purely people's war strategy. Career commanders would prefer to use modernised regular forces to conduct a firm conventional linear defence of the frontiers of the CPR. Ideally, they would employ a 'forward defence'; make a surprise pre-emptive advance beyond the threatened frontiers in order to spoil enemy preparations for attack, then go over to the defensive and set up a strong line. Such a strategy would require careful co-ordination of MRs by the General Staff. Probably, in the event of an invasion, the main forces would fight a series of conventional delaying actions whilst other elements of the PLA conducted a people's war behind enemy lines.

The main forces might also have an offensive role, although this is unlikely due to the military superiority of the primary enemies of the CPR. However, it is not impossible that the CPR would one day employ the PLA to 'restore the ancient frontiers of China', by seizing areas of territory in dispute along the frontiers or invading Taiwan. The threat of offensive action against Soviet allies and satellites in Asia could be of value to Chinese diplomacy. There is no real disagreement as to how the PLA main forces would wage an offensive campaign. The first stage would be to analyse the character of the enemy forces, and select the weakest elements for attack. Next, the PLA commanders would analyse the seat of the war and identify the key terrain, this being an area of critical importance to the enemy, usually on their potential line of retreat. This key terrain would then be seized and held by the primary force whilst secondary forces delayed or stopped enemy reinforcements; or, secondary forces would take or threaten the key terrain whilst primary forces lay in wait to ambush and wipe out enemy reinforcements. The object of offensive action would always be the complete destruction of enemy

World Armies

military units, not the gaining of ground. So tactical principles favour the concentration of greatly superior firepower on the battlefield as a precondition of any attack, and the employment of manoeuvres to ensure the double envelopment or encirclement of the enemy to prevent his escape. Strong enemy forces would be reduced to weakness by long marches, isolation and blockade before being attacked. The destruction of a weak enemy force would be reckoned a greater success than the reduction, containment or enforced retreat of one far greater. The most favoured form of battle would seem to be the strategic ambush.

The roles of local forces are less purely military.

The independent divisions and regiments of the PLA are controlled by MD HQs. In peacetime they are deployed to maintain internal security, which is of particular importance in peripheral regions of the CPR. They are also extensively used to carry out production and construction work. In war time they would lead the irregular forces in guerrilla actions against the rear areas of enemy forces. They would operate within their MDs.

The Public Security Forces in peacetime have an internal security role, and also patrol the coasts and frontiers of the CPR. In wartime they would be consolidated and used as independent units.

The Peoples' Armed Police carry on normal police business.

The Production and Construction Corps are employed primarily in economic work, especially in opening up new lands to agriculture and industry in the sparsely inhabited border regions of China. However, they have also been employed in the construction of field fortifications in frontier areas; and as they are partially armed and work in politically sensitive areas, they also have an internal security and border role.

The Militia consists of two main elements. The Common Militia is unarmed and its primary role is as a supplier of labour for production and construction. In the event of war it would provide main force and independent units and guerrillas with logistic support, coolies, recruits, food, intelligence and transport units. The Armed and Basic Militia would in wartime form guerrilla forces for local self defence and raids in enemy rear areas. They would also supply drafts to the regular forces. In peacetime the Armed Militia polices the countryside, patrols frontiers and coasts, and does a great deal of political work.

The PLA is an almost exclusively defensive force, but it serves a movement which subscribes to an aggressive revolutionary ideology. The PLA is incapable of attempting to spread revolution by conquest, but it does assist movements waging wars of national liberation by providing advisers, advice, training facilities and limited amounts of basic equipment. It is also prepared to send production and construction troops abroad to perform major engineering tasks; for example, the PLA built the Tanzam railway in Tanzania and until recently was building a highway in northern Laos.

Commitment

The most important commitment of the PLA is to protect the CPR and CPC from rebellion or invasion. It is also committed by the constitution to protect the 'just rights and interests of overseas Chinese', but it is difficult to see how this commitment could be effectively discharged. The PLA is also committed to complete the revolution in China by bringing Taiwan under the authority of the CPR. It is further committed, in theory, to restore the rightful frontiers of China, to recover lands annexed in the past by neighbours, mainly Russia.

The CPR has few formal commitments that bind it to take military action beyond the frontiers of China. There is an informal commitment to assist in the protection of the countries of Indo-China. During the Vietnamese war the PLA sent engineer and anti-aircraft units to assist the defence of North Vietnam.

The CPR has firmer commitments in regard to North Korea and Pakistan.

The Alliance signed with USSR in 1950 directed against Japan and any ally of Japan will expire in 1980. It seems unlikely that it is still a real commitment.

Deployment

The Militia and other local forces are dispersed throughout the whole area of inhabited China to carry out their internal security duties. Cavalry units are concentrated in Tibet, Sinkiang and Inner Mongolia.

The deployment of the main forces has been fairly static since 1949. This is partly because the PLA lacks mobility, because PLA units depend upon the local population for supplies, and because units developed strong local political connections which they are reluctant to break. However, in the late 1960s some corps were moved to reinforce the borders with the Soviet Union and the Mongolian SSR. It is estimated that there are now some 1,000,000 regular soldiers in 15 infantry corps concentrated in the vulnerable frontier areas of Manchuria, Inner Mongolia, Sinkiang and Szechwan. These troops are supported by three production and construction corps, in all about 40 divisions, active in Heilungkiang, Inner Mongolia and Lanchow. In addition, there is a concentration of mechanised forces in the Foochow MR, opposite Taiwan. There are also usually some armoured units deployed near Peking for political reasons. A strategic reserve of mobile forces is usually located between the Yangtze and Yellow rivers.

Estimated strengths of main force units in MRs are: Lanchow, 3 corps; Sinkiang, 1 corps; Chengtu and Kunming, 5 corps; Wuhan, 3 corps; Foochow, 5 corps; Nanking, 5 corps; Canton, 2 corps; Shenyang and Peking, 10 corps; Tsinan, 6 corps.

Recent Operations

The PLA has engaged in no large scale operations since the armistice of 1953 ended the military phase of the Korean War.

The main operations of the PLA have been designed to crush rebellions in sensitive border areas. In 1959 a large scale rebellion in Tibet was crushed, although Tibetan guerrillas are still active in remote parts of the autonomous region. In the 1960s there were uprisings by national minorities in Sinkiang and Inner Mongolia, and the PLA put these down. The PLA has also assisted in the establishment of Chinese settlers in these areas in an attempt to stabilise and secure them.

The PLA has been involved in numerous frontier clashes along the disputed borders of China. In 1962 PLA units successfully seized the Aksai Chin and certain strategic passes formerly administered by the Indian North-East Frontier Agency. Since the emergence of the Sino-Soviet dispute into public view, the PLA has been engaged in thousands of frontier incidents of varying scale with Soviet forces. The most spectacular of these occurred at Chen Pao island in 1969.

ORGANISATION

The PLA contains two types of forces: main forces and local forces. Main forces are controlled by MR HQs, local forces by MD HQs. In the event of an invasion, MRs would probably act as autonomous theatre commands, with limited co-ordination from the General Staff. All but two of the MRs contain several MDs, as given below. MD boundaries usually coincide with province boundaries.

<i>MR</i>	<i>MDs</i>
Lanchow	Kansu, Ninghsia, Shensi, Tsinghai
Sinkiang	Sinkiang
Chengtu	Szechwan, Tibet
Kunming	Kweichow, Yunnan
Wuhan	Honan, Hupeh
Foochow	Fukien, Kiangsi
Nanking	Anhwei, Chekiang, Kiangsu
Canton	Hunan, Kwangsi, Kwangtung
Shenyang	Heilungkiang, Kirin, Liaoning
Peking	Hopeh, Inner Mongolia, Shansi
Tsinan	Shantung

In the 1950s the main forces were organised on Soviet lines, and in the 1960s they tried and rejected the American 'Pentomic' form of organisation. Now they are organised on a conventional triangular pattern.

An army consists of several infantry corps and may have an armoured division attached. An infantry corps consists of three infantry divisions and it often has an artillery division attached. An infantry division consists of three infantry regiments, a field artillery regiment, air-defence battalion, reconnaissance battalion, and engineer and administration contingents. Approximately two thirds of the infantry divisions have a tank regiment attached; such a regiment would consist of a tank battalion, a battalion of self-propelled artillery, and a reconnaissance unit of armoured cars or motor cycles. An infantry regiment consists of three rifle battalions, a heavy weapons battalion equipped with mortars and anti-tank guns, and a heavy-machine-gun battery.

An armoured division consists of two tank regiments, an infantry regiment, an air-defence battalion and a reconnaissance company of armoured cars or light tanks.

Independent units of the PLA are regular forces under the command of MD HQs. There are some 300 of them, some independent divisions, but mostly independent regiments. They are organised on the same triangular pattern as the main force units, but are much more lightly equipped. Some, but not all, have integral light artillery and anti-tank support; none has tanks. Public security forces are organised as independent units for war purposes.

The Militia are under the control of local MDs and CPC committees. They can be divided into three types. The Common Militia consists of the entire population of military age not enrolled in other forces. It is unarmed, and serves as a source of labour, potential recruits and means of political control. The Basic Militia of about 20 million receives a few days of basic military training a year, but is not armed. In the event of war it would provide recruits and logistic units, and form village self-defence corps for local guerrilla operations. The Armed Militia of 5,000,000-7,000,000 are politically reliable, given basic training, and paid for their service. They are armed with basic small arms on a permanent basis. They are organised in companies of 130 — an HQ plus three platoons of 40 each. A platoon consists of an HQ and three sections. Patrols are normally carried out by platoon-sized units. Some of these troops are trained as air-defence units.

There are some 41 divisions of engineer, railway and transport troops under the control of the GRSD. In wartime they would probably come under the command of MR HQs as support troops. They would also no doubt greatly increase their size by conscripting coolie, wheelbarrow and other support units from the Common Militia.

The GRSD also exercises supervision over the troops of the Production and Construction Corps, who are organised in divisions and corps on a military pattern.

World Armies

RECRUITMENT, TRAINING AND RESERVES

Recruitment

The PLA recruits by conscription. Article 26 of the 1975 Constitution states:

'It is the lofty duty of every citizen to defend the motherland and resist aggression. It is the honourable obligation of citizens to perform military service according to law.'

Conscription was originally established in principle by the 1949 constitution, but due to the Korean War was not put into effect until 1954. Until that year the Militia was the main source of recruits.

All men and women become liable for military service at the age of 18, but conscription for the regular forces is selective. About 10% of the 9 million potential recruits that come of age each year are trained for 2–4 years' service with main force or independent units. A small proportion of these may opt for long service and become instructors or junior commanders. Those selected for the regular force must be politically reliable and of a high degree of physical fitness. Those not selected for the regular forces are automatically enrolled in the Militia.

Training

The training of regular soldiers places great emphasis on political and psychological aspects of soldiering. A great deal of time is spent indoctrinating soldiers and convincing them that political motivation and high morale can enable them to overcome enemies with superior firepower.

Military training as such concentrates upon basic skills. Recruits do a great deal of weapon training with rifles, machine-guns, mortars, grenades and mines. A drawback is that due to shortages of ammunition, live firing exercises are rare. Physical fitness and personal mobility are also stressed; even regular soldiers do a lot of physical labour, especially at harvest time, and PLA units conduct long route marches of about 30 miles twice a week. Tactical training concentrates upon fieldcraft and small scale operations; in particular, ambushes, patrols, infiltration and close assault at night.

Large scale exercises are rare. The largest manoeuvres conducted so far have been at divisional level. The PLA uses map exercises and war games to train senior commanders.

Reserves

The whole population of military age constitutes a potential reserve. The Armed and Basic Militia units are a more immediate source of trained and half-trained drafts for the regular forces. Until 1958 the regular forces sent those who had completed their military service into a special reserve; these men and women now join the Militia where they often serve as instructors and junior leaders.

EQUIPMENT AND ARMS INDUSTRY

Equipment

By Western and Soviet standards the PLA is seriously under-equipped. The regular forces (main forces and independent units) are adequately supplied with rifles, sub-machine-guns, machine-guns (light and heavy), bazookas, light anti-tank guns and small field guns. Most of these weapons were supplied by the Soviet Union before 1962, or are later Chinese copies or adaptations of Soviet designs. Tanks, APCs and motor transport vehicles are in short supply. Most armoured vehicles are obsolete Soviet models or Chinese copies of obsolete Soviet models. However, the PLA is now receiving a limited number of Chinese models; a battle tank; a light reconnaissance tank; and a lightly armoured, highly mobile APC. The lack of motor transport is a serious defect in the PLA; it means that to a large extent strategic movements must be made by rail, and tactical movements on foot. It also means that time must be spent creating stockpiles before any large-scale manoeuvre can be undertaken because resupply is extremely limited. There is a serious shortage of ammunition which limits live firing exercises.

Independent units have infantry small arms, but lack heavy weapons. They have some heavy machine guns and mortars, and perhaps a few light anti-tank weapons. Very few have any field artillery.

Some elements of the Production and Construction Corps are armed with small arms and mortars.

Public Security Forces are armed with infantry small arms only.

The Militia are only partially armed. Of the Armed Militia, some two thirds carry obsolete rifles and light machine-guns, the rest make do with grenades or improvised weapons. In the event of war the Militia would be expected to produce simple weapons such as mines from their own resources, and also arm and resupply themselves by capture from the enemy.

Arms Industry

The CPR is equipping its main forces with modern weapons, but the process is slow. The industrial base capable of producing sophisticated weapons has hardly expanded since the withdrawal of Soviet aid in 1962, and many Maoists question the need for mechanisation, citing the Maoist principle of 'men over weapons'. However, the CPR has recently begun production of Chinese-designed tanks, APCs and aircraft in accordance with the policy of strategic self-sufficiency. Armaments factories are controlled by the GRSD and the MR HQs, and are concentrated in established industrial areas; in particular in the Nanking, Peking and Shenyang MRs.

MRs are expected to be self-sufficient in food, clothing and other basic stores. In the event of war the PLA would depend upon the peasants and the enemy for such commodities.

RANK, DRESS AND DISTINCTIONS

There are no ranks as such in the PLA. Personnel are classified as commanders, commissars or fighters. Commanders hold appointments rather than ranks. Between 1953 and 1958 the PLA started to adopt a Soviet type of rank structure, and created an officer corps on the Soviet model in 1955. In 1958 this development was attacked by the central authorities, and the privileges of officers were steadily eroded. In 1965 all ranks and badges of distinction were abolished.

Commanders are selected for political reliability first and military ability second. They are trained in techniques of leadership and basic tactics in military academies on 18-month courses, then do 6 months' service in the ranks before taking up their first command. They are expected to lead in battle and training by personal example. Commanders at all levels are required to submit to criticism from subordinates, but in action would expect orders to be obeyed without question.

The uniform of the PLA consists of a green suit of quilted jacket and trousers and peaked cap. Regular soldiers wear red collar patches. The badge is a five-pointed red star.

Militia forces often wear civilian clothes and identify themselves as members of the PLA by wearing armbands.

CURRENT DEVELOPMENTS

The PLA is not an army in the Western sense of the word in that it has important economic and political functions as well as military ones. It is a conglomeration of bodies, only some of which are primarily military in their character.

The main forces of the PLA resemble the army of a second-rate European military power of the 1930s. They are short of every military commodity except manpower. They are predominantly infantry, organised on a modern basis, but not so equipped. Their policy of self-sufficiency, with consequent dependence on local sources of supply, allied to their lack of motor transport, renders them strategically immobile. Strategic immobility has resulted in the formation of strong local attachments that make them politically powerful. The soldiers in these units are tough, fit, highly mobile on foot, and well trained in basic infantry skills, except for accurate shooting. No doubt they would be formidable in nocturnal close assault, ambush and other minor operations. A serious weakness of these forces is the fact that their commanders have had no experience of large scale operations since 1953, and hardly any of large scale exercises. They would probably be effective in defence of their own well-known MRs against an invader. It is unlikely that they could mount a successful strategic offensive against a sophisticated enemy beyond the frontiers of the CPR. The PLA may create an effective modern striking force with sufficient firepower and mobility to carry out such an offensive in the future, but current progress towards such a development is slow. For the immediate future the main forces, backed up by the independent units and the paramilitary forces, are likely to guarantee the CPR against a conventional invasion, and perhaps allow it to threaten small neighbours. They will not enable the CPR to project strong military influence beyond its own immediate periphery.

In regard to the internal role of the PLA it would seem that the CPC has re-established itself in command of the CPR. But the PLA is very powerful, especially in the provinces, and in the event of a failure of order could no doubt take control of the country as it did during the cultural revolution and the power struggles after the death of Mao.

NIGEL DE LEE

COLOMBIA

HISTORY AND INTRODUCTION

The Colombian army stands apart from others in Latin America, in that it combines very considerable operational experience, second only (and that recently) to that of the Cuban, with a professional aloofness from political affairs which, though not always maintained, is unquestionably sincere. The single period of military government to which it has subjected the country (1953–7) was brought about by internal disorders of a scale and intensity which elsewhere might have been taken by the armed forces to justify their more or less permanent assumption of power.

The modern Colombian army dates from the period known in domestic administrative history as the *Reforma Militar*, 1909–11, when a Chilean military mission, which had been invited into the country to pass on its German-taught skills, did away with the haphazard system of temporary enlistment of officers and soldiers, established recruitment and training on a professional basis and founded the staff college for the higher training of officers. The army thus reformed was one with a history very similar to that of its neighbours in Ecuador and Venezuela, the survivor of nearly a century of internal revolutions and civil wars, in which its role as a national institution had been frequently challenged by provincial and personal armies following the fortunes of party, region or caudillo in the quest for dominance. It had begun as the liberating army of Bolívar, which he had led across the Andes from Venezuela to surprise the Spanish garrison of Bogotá in 1819 and win the decisive battle of Boyacá. His subsequent victories in Venezuela laid the basis for his creation of the Republic of Gran Colombia, uniting the present territories of Venezuela, Ecuador and Colombia. But he proved unable to hold the territories together in peacetime and the union was dissolved in 1830.

The forces which drove apart the territories of Gran Colombia are known for convenience as 'centralism' and 'federalism', but they were not quelled by the dissolution. As in so many other Latin American countries during the nineteenth century, Colombian politics after the dissolution took on the character of a struggle between parties representing exactly those same principles, but with the particular difference that centralism became closely identified with the church. Colombia and Ecuador compete for the title of the most Catholic country in Latin America, and though the competition is artificial Colombia is unquestionably a country in which the church arouses passionate loyalties and their antithesis. The liberals, who were generally federalists, were driven into fierce anti-clerical positions, in which they usually found themselves at odds with the national army — though so uncertain was the power of the central government that the national army could be at times outnumbered and defeated by provincial armies led by local leaders. Thus, when the army imposed its own government on the country in 1854, four former Presidents, of both liberal and conservative complexion, led personal armies to the capital and ousted it. The leader of a personal army was in power from 1863 to 1867, when the official army overthrew him by a barracks revolt (one of the familiar *cuartelazos* of Latin American politics). Moreover, against the background of struggle for control of the centre, the countryside was the scene of almost endemic warfare between neighbouring valleys, towns and villages. The strong conservative Presidency of Núñez, 1880–94, imposed some order but on his death full-scale civil war, the notorious 'Thousand Days', broke out and at its end in 1902 had caused 100,000 casualties. The disruption in national life which the war brought about allowed the United States to arrange the secession of Panama without serious local hindrance, though the deed was to rankle for many years afterwards. But it also imposed the peace of exhaustion on the country, and a temporary renunciation of resort to force by both liberals and conservatives. An important outcome of the armistice was the reorganisation of the army, known as the *Reforma Militar*, one object of which was to turn it into the sort of professional and career institution which would end its involvement in party politics and equip it to deal impartially with factional attacks on the central power of the Republic.

The reform was successful, in that the army was not thereafter drawn into national politics for nearly 50 years. It became what the reformers wanted it to be, a career force, recruited from conscripts chosen by an equitable lottery, and officered by serious-minded young men from the provincial middle class. The ruling *élite*, whether liberal or conservative, forebore from making attempts to enlist its support in their party struggles. The deep-seated divisions in the country, scarcely alleviated by efforts to industrialise and to redistribute the untilled land of the latifundia by the liberal President López (1934–8), nevertheless persisted. It was to be expected, therefore, that when a magnetic political leader arose, as he did in the person of Gaítan, a liberal who promised genuine economic and political reform, he should command an enormous following. His murder in the streets of Bogotá in 1948 led to catastrophic rioting (the *bogotazo*, which left 5000 dead) and accelerated a civil war in the countryside which had been simmering since 1946.

This extraordinary and terrible conflict, simply known in Colombia as *La Violencia*, was eventually to bring about the deaths of 200,000 people. It was 'not primarily a class struggle or even a spontaneous *jacquerie* . . . Though the liberals and communists (who called a conference of guerrilla leaders in 1952) attempted to give it political orientation and coherence, the violence remained largely unco-ordinated, purposeless and localised . . . The causes of *La Violencia* were complex and no doubt stemmed in part from the dormant regional rivalries and political feuds between local conservative and liberal

bosses in the nineteenth century, which the polarisation of political attitudes in the 1940s had revived. Following the murder of Gaftan and the *bogotazo*, each side became convinced that the other was bent on its destruction.' Curiously, the violence remained confined to the countryside and, despite the peculiarly horrible form it took (reminiscent of nothing as much as the worst excesses of the Mau Mau in Kenya), remained unknown not only to the outside world but also to the populations of the big cities. The army, which had to attempt to contain it, was nevertheless well aware of what was going on and in June, 1953, impatient with the failure of the traditional politicians to deal with a crisis that threatened to destroy the country, the commander of the army, Rojas Pinilla, deposed the President and took power himself. The army's intervention was generally welcomed by the leaders of both the conservative and liberal parties.

His 4 years of power did succeed in reducing the level of rural violence, partly by the application of new counter-insurgency techniques taught by the American-established Ranger School (*Escuela de Lanceros*). In 1957, however, he attempted to prolong his presidency and was overthrown by an alliance of conservatives and liberals, with support from the army. The parties thereupon swore a 16 year truce and established a National Front to assure settled coalition government under which fundamental reforms of the country's problems could be tackled.

A 'ten-year plan' was agreed, which won the approval of the American-backed Alliance for Progress and attracted a considerable flow of foreign investment into the country, and an Agrarian Reform Institute was set up with the aim of buying out the latifundia, increasing the holdings of the poorest peasants and reducing the country's dependence on coffee as a source of foreign income. These measures achieved some success in damping popular discontent, but the tradition of armed independence had, by the 1960s, become institutionalised in the countryside. A number of 'peasant republics' had come into existence in the valleys of the Andes south of Bogotá and on the headwaters of the Amazon. In the 1950s they had come under the influence of left-wing parties and in the early 1960s were judged to be a threat to the security of the State. In 1962 the army therefore embarked on what was to be a major counter-insurgency operation. Its outcome is described under Current Developments.

Despite the responsibility laid on the army for preserving the security of the State, and the weakening of the pact sworn by liberals and conservatives in 1957 (which allowed, for example, Rojas Pinilla to campaign as a nominal independent conservative in the 1970 elections), it has shown no signs of re-entering the political arena. Whether, with so many examples of military intervention confronting it from neighbouring States (whose problems Colombia very largely shares), it can maintain its impartiality, it is impossible to predict. Current information does not suggest the existence of a strong *peruanista* faction in the Colombian officer corps.

STRENGTH AND BUDGET

Population: 26,320,000

Army: 42,000

Navy: 8000 (including 1500 marines); 13 major vessels, 21 smaller craft

Air force: 6500; 28 combat aircraft

Paramilitary: 35,000 national police, some of whom are organised and trained as *Carabineros*

GNP (1976 estimate): \$15,200,000,000

Defence expenditure (1977): \$140,000,000

The Colombian army has tripled in size since the late 1940s as a result of the need to suppress internal disorder in the country. The largest increase took place in the early 1950s, when *La Violencia* was at its height, and the size of the army has now decreased slightly from the 50,000 it reached in the mid-1960s.

Information about the military budget is difficult to obtain. The military share of the budget is believed to be about 16%, four-fifths of which is spent on personnel costs. Equipment purchases have for many years been a small factor.

COMMAND AND CONSTITUTIONAL STATUS

Article 120 of the 1968 Constitution empowers the President 'to control the public force, confer military ranks, preserve public order throughout the territory and re-establish it if it is disturbed, direct operations of war as Commander-in-Chief and provide for the external security of the Republic'. As Commander-in-Chief the President is advised by the Supreme Council of National Defence (composed of the Ministers of Government (Interior), Foreign Affairs and Finance) and the High Military Council (composed of the Commanding General of the Armed Forces, the Chief of Staff of the Armed Forces, the Commanders of the Army, Navy and Air Force, the Commander of the Military Institutes Brigade, the Director of the Staff College and the Directory of the Military Industry Division). The Minister of National Defence, who is a serving officer, has administrative rather than command functions. The President exercises command through the Commanding General of the Armed Forces, whose own staff is the Armed Forces General Staff (*Estado General Mayor de Fuerzas Armadas*) under its Chief of Staff. This and the staffs of the three services are organised on the American model. The national police and various inter-service organisations (Directorate-General of Services and Military Industries Division)

World Armies

are also on the same chain of command as the commanders of the three armed services.

Although Colombia was under direct military rule between 1953 and 1957, and army officers have at other times been intimately involved in internal politics as individuals or groups, the Colombian army has generally during the present century preserved a professional aloofness from government. Its domestic reputation is as a professional and impartial organ of the State.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Because of the very deep-seated and violent party antipathies in Colombia, which have subjected the country to the longest and bloodiest internal disorders in Latin America, the army has a particularly important role not only as a force for the imposition of social discipline but also as an independent and impartial national institution which, all in all, it has very creditably discharged. It is also a successful protector of the national territory; the border dispute with Peru for possession of the Amazonian outpost of Leticia in 1932 ended in Colombia's favour. Colombia is a particularly devoted supporter of the United Nations, sent troops to the Emergency Force in Egypt in 1956 and maintained an infantry battalion (thrice replaced) in Korea during the Korean war. The country is a signatory of the Chapultepec and Rio Pacts and has a military assistance agreement with the United States. Internally, the army is deployed in 10 military regions, which reflect the very sharp geographical divisions of the national territory, centred on the cities of Medellín, Cali, Baranquilla, Cartagena, Manizales, Bucaramanga, Cúcuta, Santa Marta, Pasto and Ibagué. Each region is garrisoned by a brigade. The 5th Brigade is known to be stationed at Bucaramanga and the 6th Brigade at Ibagué. There is also a considerable concentration of troops, particularly instructional units, around Bogotá, the capital. The army has waged a serious internal security campaign against political militias and resistance groups since 1948, with intense periods of activity in 1953-6 and 1962-6. At least three guerrilla organisations continue to operate inside the country, but do not seriously disturb internal order.

ORGANISATION

The army is organised into the following branches: infantry, cavalry, artillery, engineers, signals, military police, medical, material and intendance. Battalions and regiments bear the names of Bolivarian generals and victories. Operationally, the army is organised into brigades, of which there are ten. Each consists of two (sometimes more) battalions of infantry and a complement of artillery, armour, engineers and signals, with supporting services. The mix of the complement does not appear to be standard. There is a Presidential Guard stationed at Bogotá, which is also the headquarters of the Military Institutes Brigade, controlling the schools and instructional units of the army. The airborne battalion is also stationed at Bogotá.

The police are a national force (*Policía Nacional de Colombia*), which have been under the control of the Minister of Defence since 1960, and were organised into a single body in 1961. Some of those in the rural areas, who have received special training, are known as *Carabineros*. The force in 1976 numbered about 35,000.

RECRUITMENT, TRAINING AND RESERVES

Since 1886 universal conscription has been the law of the land. It was not enforced until this century and has never been applied to the whole annual contingent of males of military age. Decree 3338 of 1961 reiterated the provision that all Colombian men between eighteen and fifty were liable for military service, but the system in force is nevertheless selective. Of the 160,000 Colombian males who become eighteen each year, a large number (students in higher education, principal breadwinners and clerics) are immediately exempted. The names of the others are then entered in a lottery, held at municipal level. Sufficient names are drawn, together with those of two substitutes for each, to provide a recruit contingent of about 20,000. Service is for 2 years. Recruits are trained in branch schools rather than units, which accords a higher operational value to Colombian units than prevails in most Latin American conscript armies.

Officers are recruited by competitive examination among high school students and trained at the cadet school, Bogotá. Continuation training is provided at the arms schools and staff training, for selected candidates, at the war college (*Escuela Superior de Guerra*) which was founded in 1909 by a Chilean military mission. The collection of schools and training units, most of which are around Bogotá, form the Military Institutes Brigade. An important new foundation (1955) is the *Escuela de Lanceros* (Ranger School), established with American help to train the Colombian army in counter-insurgency and jungle warfare. Several thousand Colombians have also been trained at the United States School of the Americas in the Canal Zone. With the assistance of the United States military assistance group in the country, the army also began in 1962 an extensive civil-aid programme in the countryside. Part of the programme was designed to end illiteracy among army recruits (illiterates form about a quarter of the intake, which corresponds with the proportion in the population at large).

Time-expired conscripts remain on the reserve, which is divided into three classes, to the age of forty-five. Its size is calculated at between 250,000 and 300,000, but its military value is probably very low.

EQUIPMENT AND ARMS INDUSTRY

Colombia manufactures small-arms ammunition, but imports all its arms and equipment. Most of it is American and the rest French. The army's equipment is largely obsolete or obsolescent.

Sub-machine-gun: 9mm Madsen (Denmark)

Rifle: 7.62mm SA 49/56 (France) and 7.62mm G-3 (Spain; Germany)

Anti-armour weapons: M-20 recoilless rifle (USA)

Air-defence weapons: 40mm L60/70 Bofors (Sweden; USA)

Artillery: 105mm M-101 howitzer (USA)

Armour: M-8 armoured car (USA), M-3 half track (USA) and M-4 Sherman tank (USA)

Air force: operates about 90 helicopters (this large number reflects the seriousness of the internal security situation with which the armed forces have had to deal) and 18 military transports

RANK, DRESS AND DISTINCTIONS

General de División	Two gold suns
General de Brigada	One gold sun
Coronel	Three gold stars and bar
Teniente Coronel	Two gold stars and bar
Mayor	One gold star and bar
Capitán	Three gold stars
Teniente	Two gold stars
Subteniente	One gold star

Service and combat uniforms are American in style. There are a number of orders and decorations, including the Military Orders of San Mateo, San Carlos and Boyacá.

CURRENT DEVELOPMENTS

During *La Violencia* a number of so-called 'self-defensive zones', later to be called 'peasant republics', came into existence in central Colombia, the largest of them, Marquetalia, in the south of the State of Tolima. Rojas Pinilla's declaration of an amnesty at the start of his presidency did much to quell these elsewhere but in this remote area the Colombian communist party worked to transform the 'peasant republics' into foci of insurrectionary activity. Their armed bands caused little trouble outside the immediate areas they occupied but, as autonomous and potentially subversive centres, they were judged a threat by the National Front government which ousted Rojas Pinilla and in 1962 operations were opened to reduce them. The task was entrusted to the army's 6th Brigade, which eventually was joined by two others, and in March, 1965 the Marquetalia area was cleared of guerrillas and brought under direct government control. The survivors of the bands which escaped from the district went to form a new, mobile guerrilla force, under orthodox communist leadership, known as the *Fuerzas Armadas Revolucionarias Colombianas* (FARC), which was to remain mildly active in central Colombia. At the same time another left-wing guerrilla force, the *Ejército de Liberación Nacional* (ELN), founded by an admirer of Castro, Fabio Vásquez, began to operate in north-eastern Colombia, in the department of Santander. It at first made little impact until it was joined by the most notable left-wing leader of the period, the charismatic ex-priest Camilo Torres, who was killed in its ranks in the course of an operation by the 8th Brigade, specially formed to deal with the ELN, in February, 1966. Early in January, 1968 a third left-wing guerrilla movement, claiming Maoist allegiance, opened a campaign in the northern department of Bolívar. All remain active, but at such a low level of activity that none constitutes a serious threat either to internal security or to the stability of the government. Nevertheless, there is widespread political alienation in the country and profound economic and social distress. Though the army is capable of dealing with the current level of violence, which is far lower than that which it had to tackle in the 1950s or even in its campaign against the peasant republics in the 1960s, military power does not offer the solution to Colombia's problems.

JOHN KEEGAN

COMORO ISLANDS

The Comoro Islands, consisting of four main islands and a number of smaller ones with a total area of 2236km² and a population of about 300,000, occupy a potentially important strategic position at the northern end of the Moçambique Channel (between the Malagasy Republic and the east African coast) through which passes 90% of the Arab and Iranian oil destined for Europe. The islands are virtually without visible means of support, and the average annual per capita income of about \$50 makes them a leading contender for the title of poorest country in the world. There is, however, a large armed force, devoted entirely to internal security duties, which has been variously reported at strengths of up to 11,000 men.

The four main islands of Grande Comore, Anjouan, Mayotte and Mohéli are ethnically very mixed, having been subjected to successive waves of settlement from the Malagasy Republic, Indonesia, Arab countries, Africa and Iran, with further variety being added subsequently by Portuguese and French colonisers and their imported Indian and Chinese plantation workers. On all of the islands the dominant language is a kind of Malagasy patois with degrees of Arabic and Swahili influence that vary from one island to another.

Culturally all of the islands except Mayotte have been most strongly influenced by Arab culture and have adopted the Muslim faith. The traditional ruling *élite* was an amalgamation of the original Arab conquerors (no longer racially distinct) and the Shirazis, of Iranian origin, who arrived via Zanzibar in the seventeenth century. Although an Arab-Shirazi sultanate also ruled on Mayotte, that island has retained a strongly Indian and Malagasy character, and the inhabitants became for the most part adherents of the Roman Catholic church over the course of the last three centuries.

This deep division between Mayotte (population about 40,000) and the other islands was the principal stumbling block in the way of a smooth progression to independence from France, since the inhabitants of Mayotte, with bitter memories of Arab-Shirazi rule, had no intention of being submerged in an Islamic Comoran State run from Moroni on Grande Comore. It is also clear, however, that France was extremely reluctant to surrender Mayotte, the only island whose deepwater harbour potential makes it a possible strategic base.

Paris therefore consented to the demand by the inhabitants of Mayotte that the referendum on independence in 1974 be held separately on each island. The three Muslim islands voted almost unanimously for independence, but the population of Mayotte voted 65% against independence. In an attempt to forestall the expected separation of Mayotte from the other islands, the Comoran Chamber of Deputies voted for an immediate unilateral declaration of independence on July 6th, 1975 and elected Ahmad Abdallah, the President of the Executive Council since 1972, as President of the new State. This declaration of independence, however, had no practical effect on Mayotte, which remained under the control of France.

Less than a month later, on August 3rd, 1975 President Ahmad Abdallah was ousted by a coup mounted by the principal opposition parties, making use of mercenary forces provided by Colonel Bob Denard, a well-known French Basque soldier-of-fortune who had been providing mercenary services in a large number of African countries ever since the Congo troubles of the early 1960s. The Comoran leader of this coup was Ali Soilih, who was formally appointed President by the Revolutionary Council on January 2nd, 1976. At the same time France extended formal recognition to the Comoro Islands, but when President Soilih attempted to mount an unarmed landing on Mayotte and followed that by nationalising all French assets on the islands, Paris replied by withdrawing all its personnel including its indispensable teachers and doctors.

At this point the Comoros faced economic disaster, with only 675 tons of rice remaining to take the islanders through 6 months to the next harvest. International emergency aid succeeded in staving off a famine, but the chaotic and brutal rule of President Soilih during the next 34 months reduced the islands to a truly terrible state. Proclaiming a 'cultural revolution', he dismissed the entire civil service of 3500, replacing them mainly with semi-literate high-school students, and ordered the burning of every file in the government records. The voting age was lowered to fourteen, and even telephones and typewriters were systematically smashed in the regime's revolutionary zeal.

Traditional Comoro customs such as elaborate marriage ceremonies were banned, and a complete break with the past was proclaimed. A formal political system of 'direct democracy' on the Libyan model was proclaimed, but actual enforcement of the dictator's decrees was placed in the hands of a 'people's army' or presidential militia comprised mainly of tough young men between the ages of sixteen and twenty. The stated purpose of the army was 'revolutionary construction', plus a vague future commitment to 'the reconquest of Mayotte', but its main activities were extortion and terrorism on behalf of the regime. Entire villages suspected of disloyalty were frequently razed and their inhabitants tortured and murdered. Large numbers of refugees fled to Mayotte.

Further troubles heaped on the Comoros included anti-Comoran riots in the Malagasy Republic which forced the mass repatriation of the 60,000 Comoran immigrants in the Majunga region to already severely overpopulated Grande Comore and Anjouan, and an abortive rising on the latter island in June, 1976 which was savagely suppressed. A certain tenuous contact was maintained with Tanzania, whose interest in keeping Indian Ocean islands out of the hands of the great powers caused it to lend President Soilih a few Tanzanian military advisers, but a Comoran application to join the Arab League in 1977 was met with little enthusiasm. The regime's other main external contacts were with Libya and China (which

maintained the only foreign diplomatic mission in the country), and despite considerable foreign aid from Arab sources the economy had almost totally disintegrated by early 1978. Almost all the foreign development aid that was received was diverted to buying military equipment and paying foreign advisers (i.e. mercenaries). Food production had declined drastically, disease was rife and infant mortality was soaring.

At this point reappeared Colonel Bob Denard, this time in league with former president Ahmad Abdallah whom he had overthrown on Ali Soilih's behalf less than 3 years before. On the night of May 13th, 1978 Denard led 50 mercenaries, armed only with sawn-off shotguns and hand grenades, ashore from a French-registered trawler anchored off Moroni, and seized control of the government. Resistance was minimal — only three presidential guards were killed, and one mercenary was wounded in the arm — and in 2 hours Ali Soilih was a prisoner. After taking part in a re-enactment of the invasion for the benefit of a French television team which fortuitously arrived in the islands, Ali Soilih was shot and killed 'while trying to escape' 2 days later.

The new government was announced as a 'political-military directorate' consisting of two Co-Presidents, Ahmad Abdallah and his colleague Muhammad Ahmad, and Colonel Denard as Defence Minister, Commander-in-Chief of the Armed Forces and Chief of Police. Denard assumed Comoran citizenship, embraced Islam, and took the new name of Said Mustapha Mohadjou in order better to fit his new role of 'participating in national reconstruction and forming a viable army and police force of quality'. This did not suffice to calm the indignation of other African nations, most of which are understandably terrified by the idea of white mercenary involvement in African domestic politics, and there was talk of a boycott of the Comoros by the Organisation of African Unity. Accordingly, Colonel Denard agreed to resign his posts and leave the country on September 27th, 1978.

A few days later a referendum on a new constitution was held which yielded a 99.31% affirmative vote, and Co-President Muhammed Ahmad resigned in order to clear the way for Ahmad Abdallah to assume the presidency. The new constitution is of the federal type, leaving the way clear for the accession of Mayotte at some future date, but this does not seem likely any time soon. A referendum held on February 8th, 1976 resulted in a 99.4% vote for retaining that island's links with France, and in a further referendum on May 11th of that year Mayotte voted against remaining an Overseas Territory (TOM) of France, preferring the closer connection involved in becoming an Overseas Department (DOM). Paris promised to implement the electorate's wishes, although the United Nations recognises the government in Moroni as sole representative of the whole island group.

The future composition of the Comoros army is unclear, but it is certain that the regime will continue to need such a force for internal security purposes. It is very probable that much of its strength will continue to consist of the youthful members of the former 'people's army', if only because they are too dangerous to be left wandering around outside it, and that numbers of Denard's mercenaries will be retained in some more tactful capacity in an effort to train and discipline the force. The future of the strategic island of Mayotte seems for the moment to be securely tied to France, and the island is gradually developing into a major French base in the southern Indian Ocean, with several thousand French military personnel in residence or in transit at most times.

CONGO (Brazzaville)*

HISTORY AND INTRODUCTION

The former French colony of Middle Congo attained independence in 1960, styling itself Congo; it is often referred to as Congo—Brazzaville. Its history since independence has been turbulent and confusing, the mixture of ethnic, political and armed forces' rivalries being peculiarly complex. At independence the government was headed by the Abbé Youlou — pro-French and right wing, from the centre of the country. His government fell in 1963; strikes and riots led to his downfall. Although French troops were flown in to protect lives and property, the French did not seek to perpetuate the Abbé's regime. He was succeeded by President Massemba-Debat — moderate left, also from the centre of the country — at the head of a government which included non-political soldiers and a number of left-wing socialists. This government moved rapidly leftwards, the more moderate ministers being replaced and an armed youth movement created; an attempt by the army to overthrow the government and destroy the youth movement in 1966 was suppressed by 200 Cuban troops of another body — a newly formed people's militia. In 1968–9 the country entered a period of turmoil: Massemba-Debat first dissolved the legislature, next a military coup under Captains Ngouabi and Raoul took place, then for a brief period Massemba-Debat and the army attempted to govern jointly through a larger National Revolutionary Council. This failed and Massemba-Debat resigned while the army attacked and destroyed the People's Militia and armed youth movement supporters in a 2 day engagement. Finally within the army, Captain Ngouabi emerged as the dominant figure, his popularity being based on support from northern Mbochi Kouyou soldiers, the majority group in the army.

Ngouabi remained Head of State until 1977; a Kouyou, representing northern interests, he met with increasing opposition from the south and centre expressed both in conservative and extreme-left political views. Lieutenant A. Diawara, who led an insurrectionary movement from 1972 until his death in 1973, was a Lari from the geographical centre of the territory, but of extreme-left ideology. Other plots and abortive coups were also reported in this period.

Events came to a head in March, 1977 when Ngouabi made a rough attempt to broaden the basis of his government and liberalise the regime. In a confused and violent reaction by several groups of officers, Ngouabi was killed: the blame was laid upon the luckless Massemba-Debat who was subsequently executed. The new regime is headed by another junior officer, J. Yhombi-Opango, and seems to be continuing the same strange mixture of revolutionary Marxist rhetoric and growing links with French and American capital, only in a somewhat more organised if severe style. A very important figure is Yhombi's deputy, Denis Sassou-Nguesso, who is said to favour closer links with the USSR; Sassou holds the Defence portfolio. Yhombi is a northerner while Sassou is not. The politics of the Congo are essentially those of three themes: north versus centre and south, free enterprise versus Marxist, and also increasingly, army versus police. None of the grouping runs parallel, and the police is additionally divided into at least two rival security departments and a border guard, and it is said that different sections of the army staff do, in practice, control different units of the army.

A noteworthy feature of the Congo is that half of its population lives in towns: one-fifth of the country's population lives in Brazzaville; this and certain other historical events of the colonial period have served to produce more acute tensions amidst changing societies than elsewhere.

STRENGTH AND BUDGET

Population: 1,500,000 (approximately)

Armed forces: 6000 with an air force of 300, a navy of 200, a gendarmerie of approximately 1500 and a new people's militia of approximately 2000

GNP (estimate): \$550,000,000

Defence expenditure (1978): \$35,000,000 (approximately)

COMMAND AND CONSTITUTIONAL STATUS

President Brigadier J. Yhombi-Opango remains Commander-in-Chief. The Delegate for Defence and Security on the Military Committee of the Party (CMP) of the Congolese Labour Party (PCT) is Major D. Sassou-Nguesso. The army is styled the People's National Army.

* For general notes on African armies, see Appendix 1.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

The Congo has been so preoccupied with its own affairs that its army has had little time for preparations to meet external threats. Relations with Zaïre pass through phases of friendship and hostility — Zaïre was alleged to have supported Diawara's 1972 rising — and the Congo River bank and land border is occasionally guarded, particularly in the Brazzaville area. Very recently the confused situation on the Cabinda border has led to some reinforcement of units in the area.

In 1971 following an unsuccessful coup attempt in which many gendarmerie officers were involved, it was announced that the gendarmerie was to be dissolved, and its duties given to the army. How this has been effected in practice and the position of the new people's militia in these changed circumstances is not known.

ORGANISATION

Prior to the disbandment of the gendarmerie, the army was composed of an armoured regiment, an infantry battalion, a 'parachute commando' battalion, and small armoured car, engineer and artillery units.

RECRUITMENT, TRAINING AND RESERVES

Traditionally the army has been largely recruited voluntarily from northern peoples, notably the Mbochi Kouyou; the Ngouabi government generally preserved this arrangement. Nevertheless the members of the gendarmerie drafted into the army in 1971 constitute a different ethnic following — and conflicting loyalties. In the early 1960s many of the officers were southerners, chiefly Bakongo. These have now mostly been replaced by northerners.

At independence France agreed to supply cadres and training staff, but these became associated with the Youlou government and no further staff were sent after his fall. The two army mutinies that occurred in the Youlou period appear to have been anti-French. One recent report suggests the arrival of a new Cuban training mission, with semi-permanent installations at the Maya Maya airfield and Pointe Noire harbour.

EQUIPMENT AND ARMS INDUSTRY

The tank unit possesses approximately 12 Chinese type-62 and four PT-76 tanks; there are also a small number of BRDM vehicles and 24 BTR 152 APCs in service with the 'paracommando' battalion. Recent purchases include a small number of Panhard armoured cars and APCs.

The artillery possesses very small numbers of 122mm and 100mm guns (Soviet) and 75mm guns (French), together with equally small numbers of 120mm mortars, some 57mm anti-tank and other smaller anti-aircraft guns (all Soviet), and a few obsolescent British 6 pounders. The Soviet equipment originated from Cuba and China rather than the USSR.

The air force operates 10 obsolescent Soviet MiG-17 interceptors, seven transport aircraft and four helicopters.

RANK, DRESS AND DISTINCTIONS

These follow French patterns; the *képi* is however replaced by a peaked cap.

CURRENT DEVELOPMENTS

The army is a doubtfully loyal armed political support group for the regime in power. Its combat value in action with an enemy army would be virtually nil.

L. L. MATHEWS

COSTA RICA

Costa Rica has always been unique in Central America. It was a small, relatively prosperous white nation of small-property-owning farmers in a region of extremely backward, deeply divided countries with very large Indian and mestizo populations which were dominated by tiny *élites* of rich landowners. It has been consistently ruled by civilian, democratic governments, while all its neighbours have spent the greater part of their histories under military rule. In 1948 it added a further distinction: it abolished its army entirely, converted the main barracks in San José into a museum of fine arts, and devoted its military budget to education.

Costa Rica has shared both the international environment of its neighbours and their economic problems. It formed part of the Captaincy-General of Guatemala in the Spanish colonial period, was briefly incorporated into the Mexican empire of Maximiliano de Iturbide in 1821–3, and was part of the Confederation of Central America until it broke up in 1838. It fought a serious border war with Nicaragua in the dying days of the Confederation in 1836, and its army played a large part in the war of 1853–7 which defeated the troops of the North American filibuster William Walker in Nicaragua. In 1921 a border dispute with Panama led to armed clashes (the boundary was settled by treaty in 1944).

Throughout the colonial period and the nineteenth century Costa Ricans mostly lived by subsistence agriculture, just like their Central American neighbours. In the twentieth century the country's income has derived largely from the export of tropical agricultural products, coffee, bananas and cotton, just like the rest of Central America. The 2,000,000 Costa Ricans do not have richer lands, or more land per person, than elsewhere in the isthmus.

Yet Costa Rica's per capita GNP is approximately twice that of Guatemala, Honduras and El Salvador. Education is free and compulsory, and the literacy rate is the highest in Latin America. The sole episode of military dictatorship in the country's history occurred in 1870–72, and no soldier has been elected to the presidency since 1917.

The main reason for these striking differences is that the entire country was settled by immigrants from Galicia and other parts of northern Spain. There were never many Indians in the territory, and so the *latifundia* system never became established in what is now Costa Rica; the immigrants settled down to become a homogeneous society of peasant farmers. After independence, therefore, the alliance between the army and the large landowners so familiar elsewhere in Latin America never developed, and the army had little incentive to intervene in politics. Similarly, when the development of an export-oriented cash economy and influences from the outside world began to move Costa Rican politics leftwards in the first half of this century, there was no army–landowner alliance to thwart it as there was elsewhere.

By the 1940s, consequently, both major Costa Rican political parties had adopted greater or lesser amounts of social-democratic doctrine, and the ruling National Republican Party of President Teodoro Picado Michalski was actually in a close relationship with the Popular Vanguard Party, the 'popular front' version of the small but vigorous Costa Rican Communist Party. When Picado lost the 1948 Presidential election to Otilio Ulate of the rival National Liberation Party, however, the NRP-controlled Congress attempted to nullify the election result. This led to an outbreak of civil war which lasted 2 months, and ended with the decision to abolish the regular armed forces.

The leader of the NRP, José Figueres, organised a rebel army to enforce the results of the election; the regular army continued to obey the incumbent government, and President Picado also permitted the communist leaders to organise some 2000 armed and disciplined followers to aid it. After several bloody clashes the popular forces led by Figueres defeated both the regular army and the communist militia, and Ulate was duly installed as president. Immediately after the rebel victory the regular army was disbanded, and a constitutional amendment of 1949 forbade the establishment or maintenance of a national army in future. A temporary military force may only be organised for urgent reasons of national defence.

Since then Costa Rica has relied for its defence and internal security primarily on the Civil Guard, a relatively small but well-trained volunteer force having both police and paramilitary duties. It numbers about 3000 men, all long-service volunteers, and functions as a police force in the national capital, San José, and the six provincial capitals. (A separate force called the Town and Village Police, numbering some 2500 men and trained to less exacting standards, maintains public order in other parts of the national territory.)

The Civil Guard, approximately half of which is stationed in San José, is organised essentially along military lines, with military rank titles and terminology, and equipment designed primarily for tactical military, rather than civil police, operations. It includes some special units, such as the *élite* Presidential Guard, the Traffic Force, the Detective Force, and a small Air and Sea Force with four coastal patrol boats and a few Cessna light aircraft, but the bulk of its strength is organised in companies ranging from 80 to 350 men. Companies are rotated periodically between mountain and coastal provinces. The Third Company, a large unit based in the capital through which personnel are rotated for training from throughout the nation, functions as a ready reserve and has charge of the arms and ammunition of the entire Civil Guard.

The President of the Republic is commander-in-chief of all public forces; the Civil Guard is under the jurisdiction of the Minister of Public Security, with a civilian Director-General of Public Forces in charge of day-to-day operations. However, the Minister of Government provides the budgetary allocation for supplies and equipment (the 1966 budget was

\$2,300,000), and the Minister of the Presidency has control over the National Police School. The senior officer of the Guard, with the title of Director, holds the rank of colonel.

The Civil Guard is one of the best-trained forces in Latin America. The National Police School, founded in 1963, provides both recruit training and higher-level courses, and almost 10% of the Guard's personnel have received specialised training outside the country (principally in the United States army schools in the Canal Zone, or in the USA). Ranks, uniforms and rank insignia are virtually identical with those of the United States army. Most of the Civil Guard's armament and equipment has been furnished through United States military assistance programmes, administered by a United States Army Mission accredited to the country. United States military assistance amounted to \$1,800,000 in the years 1950–70, plus an additional \$113,000 in excess military stocks.

It will be clear from the foregoing that Costa Rica's claim to have abolished its armed forces is an amiable deception, or at least an exaggeration. What it has done, with notable success, is to restrict its armed forces to the minimum level actually necessary to maintain public order in a fairly stable country, and to demilitarise them.

The Civil Guard, despite its small size, has shown itself entirely capable of handling problems along the border like those of 1949 and 1955, when Costa Rican exiles launched small invasions from Nicaraguan territory. To contend with a hypothetical military confrontation of larger magnitude — the only conceivable one being a clash over the border dispute with Nicaragua — the Guard could deploy almost all its regular forces on the frontier (there is a volunteer reserve of several thousand who meet weekly for drill and instruction, and could take over many internal security duties in any emergency). Should the highly trained units of the Civil Guard prove unable to deal with such forces of the Nicaraguan army as could be detached from guarding the government in Managua (which seems improbable), it has behind it an entire nation of peasant farmers who are familiar with firearms.

In times past Costa Rica's standard response to border provocations has been to call in observers from the Organization of American States to stabilise the situation: this worked in 1949 and 1955, when the Nicaraguan government was training Costa Rican exiles to invade the country. It prefers to have recourse to the OAS (to whose peace-keeping force it contributed a Civil Guard contingent during the 1965 Dominican civil war) rather than to the UN, or to the moribund Central American international institutions. Though Costa Rica belongs to the Organization of Central American States and the Central American Common Market, it does not belong to the Central American Defence Council (CONDECA), which it regards as being a league for the defence of right-wing military rule dominated by Guatemala, El Salvador and Nicaragua.

Relations with Nicaragua have indeed varied between cool and hostile. In addition to the intense ideological antipathy the Somoza military dynasty of Nicaragua feels towards its democratic, 'leftist' neighbour to the south, there exists a serious border dispute between the two countries over the San Juan river region on the Pacific Coast: in 1969 Nicaraguan maps were published showing the boundary 18 miles within Costa Rican territory. The Nicaraguan regime tends to stoke up this dispute as a diversionary tactic at times of internal difficulties, and in late 1977 a Nicaraguan aircraft strafed a launch on the San Juan river which had the Costa Rican Minister of Public Security on board. The dispute is not likely, however, to escalate into a full-scale military conflict.

There have, however, been signs that the Sandinista guerrillas, who launched a full-scale rebellion in Nicaragua in late 1978, have made use of Costa Rican bases for some of their forays. Diplomatic relations between the two countries were severed in late November and since then there have been outbreaks of border fighting between Sandinista guerrillas and Nicaraguan Guardsmen.

Costa Rica's original solution to the problem of military intervention in politics has been an outstanding success. The Civil Guard has shown itself to be an entirely professional, obedient and apolitical force. Civilian governments and democratic elections have succeeded one another without undue turbulence since 1948.

The various governments led by Figueres's National Liberation Party pursued moderately social-democratic policies, established friendly relations with socialist States, and in 1975 restored the Communist and other extreme left-wing parties to legality, all without encountering the extreme right-wing violence customary in other Central American States. There was an alleged plot with Guatemalan support to overthrow the President in 1976, and there are the usual sporadic bombing campaigns by right- and left-wing extremists which are now familiar in most of the world's countries, but the constitution remains safe and the Civil Guard obedient. In February, 1978 the leader of the opposition Unity Coalition, Rodrigo Carazo, was elected to the Presidency in an election which was exemplary for its peacefulness and honesty.

GWYNNE DYER

CUBA

HISTORY AND INTRODUCTION

Cuba is governed by the leaders of a guerrilla movement which overthrew the former regime in 1959 and who have preserved from those heroic days the ethos and aims as well as the appearance of revolutionary soldiers. The great majority of those at the head of every sector of public life in Cuba hold military rank, affect a military style, represent their aims and methods in military language and encourage the militarisation of the enterprises over which they preside. At the outset, the military model to which they conformed was that of the guerrilla band. As the 'revolution' has 'matured', the political style of the regime — which adopted an open and orthodox Soviet-communist alignment in 1961 — has approximated more closely to one based on a conventional regular army of the communist pattern. The Cuban Communist Party is, nevertheless, a far more 'military' organisation than any of its counterparts within the rest of the Soviet orbit. The army which the regime has created, and which has become in the last 3 years an important instrument of Soviet power in Africa, has developed from its revolutionary origins into a wholly orthodox version of the Soviet-style regular army, organised for the internal and external defence of the State, the indoctrination and training of the nation's youth and for operations overseas in the furtherance of the aims of the Soviet bloc.

The army which Fidel Castro and his July 26th Movement defeated in 1959 had been brought into being by the American provisional government of Cuba, after the United States had expelled the Spanish colonial government in 1908. Based on the *Guardia Rural*, a militarised police force, the Cuban army did not aspire to, or indeed reach, a much higher level of organisation in its first 20 years of existence. It did not attract the sons of the established classes, but tended to be officered by promoted sergeants, and accordingly was held in low esteem. Under the dictatorship of Machado, however, the army began to be used as an arm of the administration, which much increased its importance, and also the resentment of those *oficinistas* (would-be officers) who had been denied promotion. Machado's isolation from popular support prompted a group of *oficinista* sergeants in 1933 to lead a coup against him. Its success led to the dismissal of the entire officer corps and its replacement by sergeants favoured by the *golpistas*, foremost among whom was the future dictator, Fulgencio Batista. At first as Chief-of-Staff and then (1940) as President, Batista ruled Cuba until 1944, when his populist tendencies prompted him to hold elections under conditions which allowed the electorate a free choice. It fell upon the democrat Grau San Martín, whom he had installed after the 1933 coup, and who passed the succession to an ally in 1948. On the eve of the presidential elections of 1952, Batista returned from his place of exile in Florida, organised old friends in the upper ranks of the army and seized power before it could be legitimately transferred. Cuba's large and well-educated middle-class were outraged by the coup, which Batista consolidated by brutal repression of protest, and a number of groups began organising armed rebellion against him. One of these, led by Fidel Castro, then a law student, attacked the Moncada barracks on July 26th, 1953 but was repulsed, and many of its members were murdered in the aftermath. Castro was tried, but released on amnesty in 1955, and at once organised a new resistance group, entered the country in December, 1956 and set up a guerrilla base in the mountains of Oriente province, the Sierra Maestra. Batista deployed the army against them, the high point of his campaign being an encircling attack in June, 1958 at San Domingo. It failed and thereafter Castro, who by then had numerous supporters in the towns, went over to the offensive. There was little fighting. Batista's army became demoralised by its inability to find and hit the guerrillas and by its evident unpopularity. Its morale collapsed and on January 1st, 1959, as Castro's emboldened forces (which never numbered more than 2000) entered the main cities, Batista fled abroad.

Castro's guerrilla army, one of whose principal leaders was the later-to-be-legendary Ché Guevara, was quickly swelled by covert supporters and bandwagon-jumpers into a large popular militia. And at first a large armed force was needed, to repel the anti-Castroists who attempted to invade the country (including the group who landed with American support at the Bay of Pigs in April, 1961) and who remained at large in the interior. But this so-called 'anti-bandit campaign', which allegedly destroyed 179 bands of infiltrators or insurrectionaries (particularly in the Escambray mountains, Las Villas province), was largely over by 1963, in which year Castro announced, despite an earlier rejection of the step, his decision to introduce conscript service and so form a conventional army. He had many reasons for doing so, but one may have been a waning faith in the invincibility of the guerrilla approach, following the failure of expeditions to Haiti, the Dominican Republic, Nicaragua, Guatemala and Panama. Thereafter the chief proponent of the export of revolution through guerrilla warfare was to be Ché Guevara, who was to be killed in 1967 in an unsuccessful attempt to transplant it to Bolivia. But the most important reasons for the introduction of conscription were the need to discipline and indoctrinate the youth of the country in Marxist principles, which had become the official creed of the regime in 1961, and to provide a large mass of cheap labour to increase and diversify agricultural output. During the middle and late 1960s the army played a major role in agriculture; farm machinery was in fact concentrated in 1967 in the Ché Guevara Brigade, run by officers seconded from mechanised units.

America's forthright reaction to Russia's attempt to establish missile bases on the territory of its new ally in 1962 had inhibited the development of the Cuban armed forces as a strategic force. In early 1972, however, a large Soviet training mission entered the country, bringing with it much modern equipment to supplement that already supplied. The size of the army, which had fallen to under 100,000 from the peak of 300,000 it had reached during the 'anti-bandit campaign' in 1963, began to rise. The reason for this expansion was revealed in early 1975 when Cuban forces, transported by Russian ships and planes, began to appear in Angola at the side of the MPLA guerrillas. That movement, after Portugal's announcement of her intention to withdraw from the colony, had agreed to share power with the two other independence movements. But, on the FNLA's alignment with Peking, Russia apparently decided to see that the MPLA won, and deployed the Cubans as a proxy instrument of her strategy. The intervention was a remarkable success and the Cuban expeditionary force, to the extreme disquiet of the Western powers, and against their vain protests, has subsequently appeared in Somalia, Ethiopia, Moçambique and in smaller numbers in half a dozen other African countries. Foiled initially in his own continent, Castro and his army are busily propagating the revolution across the Atlantic.

STRENGTH AND BUDGET

Population: 9,850,000

Army: 160,000

Navy: 9000; 78 small craft

Air force: 20,000; 210 combat aircraft; 24 air-defence missile battalions

Paramilitary: possibly 250,000 'militia'; several armed guard and police bodies

GNP (1970 estimate): \$4,500,000,000

Defence expenditure (1971 estimate): \$290,000,000

Under the Batista regime the proportion of the budget devoted to defence varied between 15 and 25%. More recent figures are difficult to come by. It has been estimated that the proportion in 1965 was 8.4%. It is certainly now very much higher but is covered to a large extent by subsidy from the Soviet Union. Castro is reported to have announced in 1970 that Russia had supplied military equipment to Cuba to the value of \$1,500,000,000.

COMMAND AND CONSTITUTIONAL STATUS

Article 129 of the Fundamental Law (Constitution) appoints the President as Supreme Commander, but the position is nominal. Fidel Castro, as Prime Minister and First Secretary of the Cuban Communist Party is Commander-in-Chief. The Minister of the Revolutionary Armed Forces (his brother, Raúl Castro) stands at the head of the chain of command, which runs to the general staff of the armed forces, headed by a vice-minister/ chief of staff, assisted by a vice-minister for supply. The chain then separates into three: one branch runs to the chief of operations and the operational units; another to the chiefs of armour, artillery, *Defensa Civil*, and the political sections (commissars); and the third to the paramilitary forces (Frontier Guard, etc.) The Council of Ministers is empowered to fix the size of the armed forces and decide on their organisation. In practice, power resides with the Central Committee of the Cuban Communist Party, which is two-thirds military in composition (in that its members wear uniform and hold military rank), and more particularly with the Politburo of the Central Committee, of which three-quarters hold military rank. Castro, as Commander-in-Chief, is believed to deal directly with the commanders of operational formations, and the Minister of the Armed Forces to play a chiefly administrative role.

As in all communist armies, the commissar system is an important element in the control and indoctrination of the units. Under the head of the Political Section, communist party cells work in each formation and unit down to company level. The head of the cell has authority equal to that of the formation or unit commander, except in purely military matters. His mission is 'to assure military loyalty and efficiency and help leaders in the strict fulfilment of their assigned duties, to give instruction in Marxist principles to the unit's members, to prevent deviation from the socialist line and guard against defeatism'.

Cuban units operating in Africa seem to have generally been under the operational control of Soviet commanders.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

Cuba under Castro is a highly militarised society. Military service is obligatory and genuinely universal, and its object is not only to provide a large standing army and an even larger reserve, which it does, nor even to furnish a plentiful supply of cheap agricultural labour, which it also does, but to politicise, and above all discipline, Cuban youth. Military influence

World Armies

pervades the highest political levels. Almost all Cubans of importance hold military rank and wear military uniform. The language and ethos of the ruling party, the Communist Party of Cuba, are very military and hark back to the heroic guerrilla days of the leaders in the Sierra Maestra. Attempts to distinguish, therefore, an army role distinct from that of the apparatus of the State are more difficult than in other countries, even other communist countries. Nevertheless, it is possible to point to: the defence of the national territory; civic aid and rural development; the maintenance, with the paramilitary organisations, of internal security; the clandestine training of foreign military and guerrilla personnel; and the execution of military missions abroad, particularly in Africa, under the aegis of the Soviet Union. That role began with the deployment of Cuban units to Angola in 1975.

Commitment

Cuba is still legally a signatory of the Chapultepec and Rio Defence Pacts and a member of the Organisation of American States, but has been excluded from its workings by a decision of OAS foreign ministers since 1962. Although Cuba has a close military association with the Soviet Union, and has received a great deal of financial and military aid from her, the two countries have no military agreement which has been made public.

Deployment

The army in Cuba is divided into three field armies, in the east, centre and west, centred on Pinar del Río, Las Villas and Oriente provinces. Each disposes of about five infantry brigades (called divisions) and an armoured brigade. There are also about 20,000 Cuban troops in Africa: about 15,000 in Angola, where they are in action against the unsubdued forces of the FNLA and UNITA movements; about 2000–3000 in Ethiopia, where they have been in action with the Ethiopian army against the Somali army; about 1000–2000 in Moçambique, where they support the guerrillas of the 'Patriotic Front' in their campaign against Rhodesia; and small numbers of advisers, specialists and technicians in Congo (Brazzaville), Guinea (Conakry), Sierra Leone, Tanzania and Uganda. There may also be small numbers in Benin, Burundi, the Cape Verde Islands, the Malagasy Republic and South Yemen.

Recent Operations

Following the falling-out between the three nationalist guerrilla movements which acceded to power after Portugal's decision to withdraw from Angola, Cuban units appeared in that country (early 1975), transported there in Soviet ships and aeroplanes. They joined forces with the Moscow-aligned MPLA, and fought three campaigns during the course of 1975: the first in the north against the FNLA guerrillas, whom they succeeded in driving into Zaïre (the guerrillas have since returned in some numbers); the second in the south, where South African forces had entered the country, but withdrew before making serious contact with the Cubans; the third in the east, against the UNITA guerrillas, whom they did not succeed altogether in subduing. Although the campaign was regarded as finished by early 1976, and a large number of Cubans were withdrawn, revived activity by UNITA, and to a lesser extent by the FNLA, has brought Cuban reinforcements back into the country, so that the number deployed there is reckoned to equal that present at the height of the campaign — about 15,000. Some are reported to have been involved in the unsuccessful invasion of Shaba province (Katanga) of Zaïre in March, 1977 by the 'ex-Katangese gendarmerie'. Cuban casualties in Angola are reported by their guerrilla enemies to be high but probably do not exceed a few hundred dead.

Cuban troops were next reported present in Somalia, but, following Russia's decision to back the Ethiopians in the Somali–Ethiopian border war, were transferred to Ethiopia, where they were deployed in late 1977. They took a major part in the Ethiopian counter-offensive which regained the Ogaden province from the Somalis in February–March, 1978. They were again reported to have suffered heavy casualties but these were probably exaggerated.

ORGANISATION

Information about the domestic and operational organisation of the Cuban army is scanty. The pre-revolutionary army was organised on the American model. The army set up by Castro on the basis of his guerrilla army was an *ad hoc* organisation. The *Fuerzas Armadas Revolucionarias* seems to be moving towards the Soviet model in organisation, but formations are not yet closely similar to those in the Warsaw Pact. Operationally the army is organised into 15 infantry brigades, three armoured regiments and eight independent infantry regiments. The brigades probably resemble the Soviet motor rifle divisions without the tank regiments and with a smaller artillery complement. The armoured regiments probably resemble the Soviet tank regiment, with two tank battalions each comprising about 90 to 100 tanks.

There are a number of paramilitary organisations. They are: the Frontier Guard Corps, which are the armed customs guards; the Frontier Guards, about 3000 strong, whose principal role is to guard the perimeter of the American naval base at Guantánamo; the *Lucha Contra Bandidos*, a corps of rural vigilantes originally formed to trace incursions by anti-Castroists, but now engaged on rural development work (if still indeed a recognisable entity); the Young Labour Army (EJT), in

which conscript youths unsuitable for military service do agricultural labour and rural development work, and which has absorbed all previously existing worker youth organisations; and the militia, known until 1969 as the *Militia de la Defensa*, but then renamed the *Defensa Civil*. The militia, at the outset a mass organisation to which the party and the leadership accorded great importance, has been progressively downgraded in status. It was originally divided into combat companies, composed of men and women under thirty, and guard companies, composed of men and women between thirty and fifty. Its role was to 'guard the interests of the people by protecting the manufacturing and commercial installations of the country, and standing ready to defend the nation's cities in the event of hostilities while the regular forces are away at the front'. It was urban in composition and numbered at its height about 250,000. Originally its members held arms, with which they practised on ranges which were set up in all cities, and also practised guerrilla tactics. Arms were subsequently withdrawn and held in central locations. Its rural equivalent was the Workers' Militia, the peasant members of which were initially encouraged to work 20 days in the month in the fields and to spend the other ten in military training. Its importance has now also apparently been reduced.

Air defence is the responsibility of the Air-Defence Forces of the air force, which man 24 missile battalions equipped with Russian SA-2 and SA-3 missiles.

RECRUITMENT, TRAINING AND RESERVES

Castro's original declaration on seizing power, at the head of a force of guerrilla volunteers, was that 'we will not establish military service because it is not right to force a man to put on a uniform and a helmet, to give him a rifle and force him to march'. Four years later, however, he announced that conscription, together with compulsory secondary education, would be introduced, to prevent the emergence of the 'parasitical element, the potential *lumpen* of tomorrow'. His brother Raúl, the Minister of Defence, when introducing the compulsory military service law on November 12th, 1963 denied that it had been designed 'to do away with wasters' but nevertheless announced that the low starting age of seventeen had been chosen to include as many school-leavers as possible, who would be divided into two classes, those who would actually be allowed to bear arms and those who would do agricultural work, 'the wasters, *lumpen* and counter-revolutionaries'. In practice, all conscripts, who served for 3 years, spent part of their time in the fields or at civic-aid projects. This is still believed to be the case with units stationed in Cuba, whose members spend between a quarter and a third of their service (*Servicio Militar Obligado*) on non-military work. Recruits are inducted in April-May each year and given their basic training in a recruit-training centre, of which there is one in each of the field army areas (east, centre, west). They receive advanced training in their units. Technicians are trained at the Military Technical Institute, Manano, Havana.

Officers may be chosen in one of three ways: by direct appointment; by volunteering; or by selection from the ranks of the conscripts, this last being effectually the main route. There are a number of officer-training institutions: the Military Academy, for infantry officers; the Camilo Cienfuegos Artillery School, for artillery officers; and the Antonio Macco Interservice Cadet School for armoured, mechanised, signals, engineer and other officers. Higher military studies are also conducted in these schools, apparently by Soviet personnel. Cadets must be between sixteen and twenty-one and most belong to the *Unión de Jóvenes Comunistas*.

In the late 1960s the government set up a number of military preparatory schools, called Camilo Cienfuegos Schools, and there is now one in each of the six provinces. Pupils (called *Camilitos*) are aged ten to sixteen and receive a normal education along with their military training. They are apparently intended to supply the officer-training institutions. The total number of pupils in the early 1970s was about 16,000.

Time-expired conscripts go to form the reserve, which now numbers about 90,000. Conscripts who so volunteer may engage as regular soldiers for a 5 year term and as many as half are said to do so, though only a small proportion are accepted.

The militia, which used to form a parallel army, available for duty in emergency, has been progressively downgraded in importance. In April, 1973 all militiamen were given the honorary rank of *subteniente* in the Revolutionary Armed Forces but ordered to cease wearing their militia uniforms and accorded the right to wear military uniforms only when called upon to perform military duty.

EQUIPMENT AND ARMS INDUSTRY

Before Castro's seizure of power, the Cuban army was equipped with American equipment, much of it obsolete (the infantry generally carried the 1903 Springfield). It has subsequently been re-equipped with Soviet weapons, though some American equipment may not yet have passed out of service. The country does not yet manufacture any equipment, though it may now produce some small-arms ammunition.

Rifle: 7.62mm AK-47 (USSR)

Mortar: 82mm M-42 (USSR)

Anti-armour weapons: 57mm M-43 gun (USSR), 85mm M-45 gun (USSR) and Snapper missile (USSR)

World Armies

Air-defence weapons: 37 mm M-39 gun (USSR), 57 mm M-50 gun (USSR), 85 mm M-44 gun (USSR), 100 mm M-49 gun (USSR), ZSU-23 multiple cannon (USSR), SA-2 missile (USSR) and SA-3 missile (USSR)

Artillery: 75 mm M-116 pack howitzer (USA), 105 mm M-101 howitzer (USA), 122 mm M-31 gun (USSR), 122 mm M-38 howitzer (USSR), 122 mm M-55 gun (USSR), 130 mm M-54 gun (USSR) and 152 mm M-37 gun (USSR); FROG-4 missile (USSR; 30 in service)

Armour: BRDM-1 armoured car (USSR), BTR 40/60/152 APCs (USSR; 200 in service) and SU-100 assault gun (USSR); JS-2 heavy tank (USSR; obsolete; 60 in service); T-62 tank (USSR; 60 in service), T-34 tank (USSR; obsolete) and T-54/55 tank (USSR); PT-76 light tank (USSR). (The total number of tanks in the Cuban army is estimated to be 600)

Air force: Operates 50 military transports and 54 helicopters

RANK, DRESS AND DISTINCTIONS

Until 1973, the highest rank held by any Cuban officer (including Fidel Castro as Commander-in-Chief) was that of *Comandante*, which means both 'major' and 'commander'. Below that were two ranks of captain and three of lieutenant. In 1973 Castro introduced a new rank system which conformed more closely to the traditional. He explained his innovation thus: that the armed forces had been distinguished by their modesty in uniform and rank but that the revolution had become more mature and the armed forces with it. They also needed to match the practices of the Russian and other allied armies. His new system, common in Latin America, divided officers into three groups: generals, chiefs and officers (called by him 'superior', 'first' and 'subaltern'). The ranks are:

- Comandante de Ejército
- Comandante de Cuerpo
- Comandante de División
- Comandante de Brigada
- Coronel
- Teniente Coronel
- Mayor
- Capitán
- Teniente Primero
- Teniente
- Subteniente

Under the old system, the highest ranks wore gold stars, while those corresponding to colonel and below wore gold chevrons.

Cuban army dress still follows, despite the Russian alliance, the United States army-surplus styles worn by Castro and his followers in the Sierra Maestra. A more sober uniform for senior officers has been seen.

CURRENT DEVELOPMENTS

The Cuban army is now operationally the most experienced in Latin America and, though limited for manpower, the most powerful. It is unable, in the face of United States control of American waters, to operate either in the Caribbean or on the mainland, where the governments are uniformly hostile to the Castro regime and all now sufficiently in control of their own populations and territories to deny it a base, however remote, from which to propagate rebellion, as Ché Guevara tried to do in Bolivia in 1967. While it remains Castro's declared policy to transplant the 'Cuban revolution' to the rest of Latin America, it seems likely therefore that the Cuban army will continue to be engaged only in those areas where the Soviet government is able to sponsor its operations. At present this means Africa, though Cuba also has close links with anti-Western governments and organisations in the Middle East and south-east Asia. The United States and its allies have not as yet found any means of translating their hostility to the Cuban army's intervention into effective opposition.

JOHN KEEGAN

CYPRUS

HISTORY AND INTRODUCTION

The turbulent recent history of Cyprus, which has turned it into something approaching an armed camp, has been dominated by Greek–Turkish rivalries at two levels. One field of conflict has been between the Greek–Cypriot majority (about 80% of the island's 650,000 people) and the Turkish-Cypriot minority over mainly local issues, but in recent decades this has been consistently overshadowed by the conflicting interests of the two mother-countries.

For Greeks, Cyprus is the last unrecovered portion of the Greek irredenta (apart from formerly Greek areas of present-day Turkey, which are forever lost through a change in the population itself from Hellenic to Turkish). The in-gathering of the irredenta has been the main focus and purpose of Greek nationalism in the modern era, and so Cyprus remains a powerful emotional factor in Greek politics.

The Greek Cypriots have never been ruled from Athens and have traditionally entertained mixed feelings about throwing in their lot with their mainland relatives, whom they see as relatively backward economically and politically, and prone to recurrent military dictatorships. Nevertheless the emotional attraction of Greek unity is strong, and so the Greeks of Cyprus have found their politics dominated by violent disagreements about the desirability and practicability of *enosis* (union with Greece).

The question of practicability arises because of adamant Turkish opposition to the union of Greece and Cyprus. The opposition proceeds in part from sympathetic support for the Turkish-Cypriot minority, which would lose all effective political voice if submerged in a sea of 10,000,000 Greeks and sees its own future in such a case as one of gradual disappearance through emigration, but there is also a strategic motive in Ankara. A cursory glance at Greek–Turkish relations over the past century and a half convinces most Turks that the possibility of yet another war with Athens must be numbered among the strategic contingencies they face, however good Greek–Turkish relations may be at a given moment.

In such a possible conflict at some future time, possession of the island of Cyprus, only 40 miles from the Turkish south coast, would give the Greek air force, and to a lesser extent the navy, large strategic advantages. From Cyprus bases Greek aircraft could attack targets in virtually all parts of Turkey, and would require Turkish air defences to deal with a threat from a quite different direction. However hypothetical such calculations may seem, they play a substantial role in Turkish military thinking, and greatly fortify the opposition of Ankara to *enosis* which derives from purely political and emotional grounds.

Cyprus has been Hellenised since the middle of the first millennium BC, when Greek colonies were founded in the island and rapidly eroded the former Phoenician influences. In 1579, however, the expanding Ottoman Empire conquered Cyprus, which it was to hold for the next three centuries. Ottoman rule was by no means totally unpopular — the conquerors ended the feudal status of the peasantry, restored the independence of the Greek Orthodox Church, and allowed a considerable degree of self-government to the subject Christian community through the *millet* system. Conforming to their usual pattern, the Ottomans made little or no attempt to proselytise the Christian majority on behalf of Islam.

They did settle about 30,000 demobilised Turkish soldiers in Cyprus, however, in order to provide a loyal resident garrison cheaply. These Turkish Muslims (plus a certain number of later immigrants) were the origin of the severe communal problem which has plagued Cyprus for the past century, for they proved almost wholly resistant to the pressures towards assimilation that usually operate against such minorities.

Cyprus passed peacefully under the control of the British Empire in 1878, in order to provide Britain with an eastern Mediterranean base from which it could assist in the defence of the Ottoman Empire against Russia. Sovereignty was not transferred to Britain until 1914, however, when Britain and Turkey found themselves on opposite sides in World War I, and London actually offered the island to Greece in the following year in an unsuccessful attempt to induce Athens to join the Entente Powers. The offer did not remain open, however, and from 1925 Cyprus was administered as a Crown Colony.

Over the succeeding three decades the movement for *enosis* grew steadily amongst the Greek-Cypriot majority. At the same time the strategic importance of Cyprus to Britain gradually increased as its other Mediterranean base areas one by one gained independence. A British proposal in 1954 to create a restricted form of constitutional government in Cyprus leading to self-government within the Commonwealth was accepted by the Turkish community, but rejected by the *enosis*ists. The latent conflict burst into the open in the following year, when a guerrilla movement known as the National Organisation of Cypriot Fighters (*Ethniki Organosis Kyprion Agoniston* — EOKA) began active operations to evict Britain from Cyprus and achieve union with Greece.

EOKA's terrorist campaign, assisted by clandestine aid from Greece, was led by General George Grivas and tacitly

World Armies

supported by Archbishop Makarios, the religious leader of the Greek-Orthodox majority on the island. The latter was exiled to the Seychelles in March, 1956 but the campaign steadily gained ground through the later 1950s, tying down about 10,000 British soldiers. The Turkish community readily collaborated with the British authorities against EOKA, and the first serious outbreaks of Greek–Turkish strife occurred in 1958.

In 1959, however, the EOKA leadership split, with Makarios accepting the ‘Macmillan Plan’ for independence without *enosis*. According to the London Agreement of 1960 neither partition of the island nor union with another State would be permitted, and its independence would be guaranteed by Britain, Greece and Turkey. Makarios returned to Cyprus and was elected the new Republic’s first President, while Grivas fled to Greece. Cyprus became independent in August, 1960. There remained deeply aggrieved minorities, however, amongst the unreconciled *enosis*ists and amongst Turkish Cypriots who would have preferred partition.

Under the 1960 Constitution, Cyprus had a Greek President and a Turkish Vice-President, with both the Cabinet and the House of Representatives split 70%–30% between the Greek and Turkish communities. The Turkish Vice-President had a veto over certain subjects, and separate majorities in both communal groups in the House were required to pass financial legislation. There were to be separate Turkish municipal governments in the main towns, and separate communal Chambers to deal with religion, education and cultural matters.

The public services were constitutionally obliged to employ 70% Greeks and 30% Turks, and the 2000-man army was split 60%–40%. Greece received the right to station 950 troops on the island, and Turkey 650, to safeguard the rights of their respective communities. Britain retained sovereign rights over large base areas, and all three States were granted the right to intervene, together or separately, to uphold this settlement.

Such cumbersome arrangements were seen to be necessary to prevent civil strife, but even with much good will on either side they might have proved impossible to work. As it was, there was no good will, and disputes over the Turkish municipalities, Turkish–Cypriot vetoes on Makarios’s attempts to integrate fully the army and public services, and other issues led to total deadlock in only 3 years. In November, 1963 Makarios formally proposed constitutional reforms which would sweep away most of the Turkish community’s entrenched safeguards, and all co-operation ended.

Underground groups in both communities were already preparing for conflict, and full-scale civil war broke out in December, 1963. The Turkish community, scattered throughout the island, was shut-up by dozens of separate sieges round their villages or the Turkish quarters of various towns, and some massacres occurred when local defences collapsed. Atrocities grew common on both sides, the number of irregulars under arms rose rapidly, and aid flowed in to the combatants from Greece and Turkey. Tension grew to dangerous levels between the two mother countries.

The arrival of UN forces (UNFICYP) in March, 1964 ended the worst of the fighting, but the bi-communal republic was effectively at an end. For the next 11 years the Turkish community lived under a form of modified siege, and the institutions of government in Cyprus passed entirely into Greek hands. By mid-1965, moreover, Makarios’s desired constitutional changes had all been passed into law, transforming the State into a unitary, majority-dominated Republic with single municipalities, no Turkish veto, and no separate communal electoral rolls.

The bi-communal army provided by the 1960 Constitution was also ended for practical purposes, although it was only officially disbanded in 1968, and in June, 1964 the (now totally Greek) House of Representatives established a National Guard in which all male Cypriots between eighteen and fifty-nine — all Greeks, in practice — were liable to 6 months’ service. The term of service was extended to 1 year at the end of 1964, and is now 2 years. A Greek–Cypriot navy was also created in 1964, with the primary purpose of preventing the landing of arms to the beleaguered Turkish community, and grew to include six ‘torpedo boats’, two larger patrol craft (a third was sunk by the Turkish air force in 1964) and ten smaller craft. The vessels were mostly provided by the Soviet Union.

The main purpose of this measure was to bring the various irregular Greek forces under government control, but it failed in that aim. In late June, 1964 Grivas returned to the island from Greece and took effective command both of the new National Guard and of ‘volunteer’ Greek forces. He took his orders from the Ministry of National Defence in Athens, and a proposal by Makarios to transfer control to the Cyprus Ministry of Defence in 1966 was sharply rejected by both Grivas and the Greek government.

The politics of Greek Cyprus for the next decade were dominated by the struggle between Makarios, who had reluctantly concluded that *enosis* was impossible at least for the moment as it would cause a Turkish invasion, and those in Cyprus and in Greece who persisted in the struggle to achieve union. Makarios had been driven to this conclusion by the events of June, 1964 when Turkey had indeed come very close to mounting an invasion to rescue the Turkish Cypriots. Only a direct warning to Ankara from the USA’s President Johnson had prevented it.

A possible solution arose in 1967, after a coup in Athens brought the Greek army to power, when Turkey offered to accept *enosis* in return for military bases in the island and 10% of the territory, but it was rejected by the Colonels’ regime in Athens. By the end of 1967 Turkey and Greece were again on the brink of war, after a massacre of Turkish villagers in November by the Greek Cypriot National Guard.

American intervention once again secured Turkish demobilisation, but Athens was compelled to withdraw Grivas from the island. Both the Greek and Turkish army contingents stationed in the island were reduced once more to the numbers permitted by the 1960 Constitution. At the end of 1967, however, the Turkish Cypriots announced a ‘Transitional Administration’ to run their affairs until the 1960 Constitution was restored, with a legislature drawn from the Turkish members of the old House, and despite Greek–Cypriot denunciations of its illegality it operated thenceforward as the *de*

facto government of the besieged and scattered Turks.

There were sporadic inter-communal talks over the next 5 years, and the blockade of the Turkish Cypriots was eased somewhat except in the Turkish quarter of Nicosia. No progress was made on the central issues, however, and the blockaded Turks had little share in the rapidly rising prosperity of the island under the impact of mass tourism. Indeed, under this severe economic pressure the Turkish-Cypriot community was rapidly shrinking through emigration — between 1963 and 1974 almost one-sixth of the community left the island.

Makarios was re-elected President in 1970 by the Greeks, and Rauf Denktash was elected as Vice-President in the same year by the Turkish community. Increasingly, however, the Greek-Cypriot community was split into two armed camps, with the Athens government scarcely concealing its support of the *enosis*s. Pro-*enosis* terrorism against the Makarios government was resumed in 1969 by the newly formed National Front, which attempted to assassinate the Archbishop in the following year.

Late in 1971 Grivas again returned to the island, with the secret support of the Greek government, and rapidly transformed the National Front into a more effective organisation called EOKA-B. The Greek-Cypriot National Guard, still under the effective control of Greek army officers, was a tool of uncertain loyalty to Makarios, who was therefore forced in early 1972 to dismiss his anti-Athens ministers and admit some moderate *enosis*s to his government.

Makarios did not cease to resist the folly of *enosis*, however. He secured arms from Czechoslovakia, and created his own paramilitary counter-balance to the Athens-dominated National Guard in the form of a Special Police Reserve. During 1973 he succeeded in dismissing numerous police and National Guard officers who were suspected of being active EOKA supporters, and the EOKA terror campaign was flagging by the time Grivas died of a heart attack in January, 1974.

Meanwhile, however, a new military *junta* had come to power in Athens, more enthusiastically pro-*enosis* and less cautious than its predecessor. Suspecting that it might take direct action against him, Makarios carried out a further purge of EOKA supporters in the police, civil service and National Guard in June, 1974. He then wrote to the Greek government on July 2nd, 1974 accusing it of giving arms and subsidies to EOKA and of using the Greek army officers attached to the National Guard as a centre of subversion. He demanded their withdrawal, and published the letter.

The Greek *junta*, with a ruthlessness nearly as great as its ignorance, replied by ordering his overthrow. On July 15th, 1974 the National Guard, led by Greek army officers, launched a coup in Nicosia, defeated the Special Police Reserve, and attacked the Presidential Palace. Makarios barely escaped with his life, fleeing to a British base and thence to Britain, while the National Guard installed as President the former EOKA gunman Nicos Sampson, who was known to have personally directed massacres of Turkish Cypriots.

Sampson declared Cyprus a 'Hellenic Republic', and his followers talked of achieving *enosis* by the end of the year. They turned at once to hunting down and murdering Makarios supporters, of whom up to 2000 were killed in the following week, but serious massacres of isolated Turkish communities did not begin until the Turkish invasion 5 days later.

It has been argued that the Greek colonels launched their coup against Makarios in the hope of restoring their own rapidly deteriorating position in Greece, and that they actually failed to realise that Turkey would react militarily to the threat of *enosis*. It is also possible, having regard to the level of intelligence they displayed in other actions, that they simply neglected to think matters through. The result, in either case, was to call down the ultimate disaster in Cyprus.

The Turkish government instantly announced its intention of intervening in response to this flagrant violation of the 1960 agreement, and Prime Minister Bülent Ecevit flew to London to seek British support as co-guarantor of Cyprus independence. When the British government refused to act, the Turkish invasion went ahead on July 20th. (For details of military operations in Cyprus in 1974, see Role, Commitment, Deployment and Recent Operations.)

The Turkish landings near Kyrenia on the northern coast rapidly overcame the resistance of the Greek-Cypriot National Guard and the small Greek army forces on the island, though they were powerless to prevent massacres of Turkish Cypriots elsewhere. Greece itself mobilised, but the shambles that ensued in an army which had neglected its military duties for the past 7 years, and the obvious impossibility of intervening in the fighting in Cyprus, quickly persuaded even the Greek army's own generals to withdraw their support from the bewildered and panic-stricken *junta* in Athens. Turkey declared a ceasefire on Cyprus on July 22nd, when the Turkish army held a narrow bridgehead extending inland from the northern coast to the outskirts of Nicosia, and on the following day both the Sampson regime and the Greek military government resigned. United Nations forces did not become involved in the fighting.

Negotiations soon afterwards began in Geneva between the Turkish government and the new civilian government of Greece headed by Constantine Karamanlis. They broke down, however, when the Greek government rejected Ankara's proposal to create a federal republic in Cyprus organised on a cantonal basis. The Turkish map would have given the Turkish Cypriots control over various areas amounting to just over 30% of the island.

When the proposal was refused, Ankara decided to seek a more radical solution by military force — to carve out a single, continuous area in which all the Turkish Cypriots might live in safety, though still within the context of an independent and federal State. The Turkish military advance was renewed on August 14th, 1974 and Greek-Cypriot military resistance promptly collapsed. The Turkish army's advance halted when it had reached a line running approximately Morphou—Nicosia—Famagusta, encompassing about 36% of the territory of Cyprus.

There has been no further military activity in Cyprus since August, 1974 and the ceasefire line has not moved. The great majority of former Greek-Cypriot residents of the Turkish-occupied territory fled in 1974, and all but a few hundred of the others have since been induced to leave. Virtually all Turkish Cypriots originally living south of that line (half the

World Armies

Turkish-Cypriot population) had managed to get themselves to the north by the end of 1975, many of them via the British base areas in which they had taken refuge in 1974. The situation can be viewed as one in which almost half the island's population (around 200,000 Greeks and 90,000 Turks) have become temporary refugees, or more realistically as an enforced and permanent exchange of populations to create two ethnically homogeneous areas.

The Turkish government's position remains that of seeking an independent and federal republic on Cyprus, though obviously no longer on the basis of the 1960 Constitution. It rejects the possibility of partition and 'double enosis'. In pursuit of its objectives Ankara permitted the declaration of the 'Turkish Federated State of Cyprus' in 1975 — rather like the sound of one hand clapping, since there is no Cyprus federation — but it will not allow the Turkish Cypriots to declare their full independence.

The Greek-Cypriot government, again under Archbishop Makarios, and supported by Athens, refused to accept this *fait accompli*. In 1976 it was prepared to consider some federal solution provided the boundaries of the Turkish zone were radically moved back to allow the majority of Greek-Cypriot refugees to return to their homes. These homes have long since been occupied by Turkish-Cypriot refugees from the south, however (as has happened, in reverse, to the homes the latter abandoned). With each passing year the scope for alterations in the *de facto* boundary becomes less.

Cyprus remains pre-eminently a place of arms, with four separate armies — Turkish, British, Turkish Cypriot and Greek Cypriot — quartered on its soil, plus the UN contingent drawn from eight outside nations. In an island whose population is less than 750,000, there are almost 60,000 soldiers under arms. The major fighting, however, is probably over. At the cost of a catastrophe, the Cyprus problem has been 'solved', though only with the passage of time are the various participants in the tragedy likely to reconcile themselves to the solution.

STRENGTH AND BUDGET

The Cyprus National Guard, exclusively Greek in its membership, has an estimated strength of 12,000 men, with an extensive reserve organisation. This is a very considerable reduction from the approximately 40,000 men (including some 10,000 Greek army regulars) who made up the strength of the National Guard in the late 1960s. There are an estimated two battalions of Greek army regulars distributed amongst the National Guard formations. The combined military and police expenditure of the (Greek) Cyprus government in 1975 was \$10,100,000, out of a total budget of \$162,000,000. This figure is virtually unchanged from 1968, but represents a decline from 19% to 6.2% of the national budget.

The Turkish-Cypriot Security Force, exclusively Turkish in its membership, has an estimated strength of 6000 men, again with large reserves. This is also a major decline from the average of 10,000–15,000 troops who were serving in the Turkish Defence Organisation in the late 1960s. Its budget is unknown, but it is certainly heavily subsidised by the Turkish government.

There are, in addition to these indigenous armed forces, three other military organisations present in Cyprus. The Turkish armed forces in early 1977 had approximately 25,000 troops in the island (down from the 1974 peak of almost 40,000), whose expenses are met by the Turkish military budget. The British armed forces maintain about 4000 army and air force personnel (and another 4000 dependents) in the Sovereign Base Areas of Dhekelia and Akrotiri, whose costs are covered by the British defence budget. United Nations Forces in Cyprus (UNFICYP) have a strength of 2778 men (down from almost 7000 in the mid-1960s), whose costs are paid by voluntary contributions from 59 UN member nations (none of which belongs to the Soviet bloc). The cost of UNFICYP since 1964 has been over \$250,000,000.

COMMAND AND CONSTITUTIONAL STATUS

The Cyprus National Guard is ultimately responsible to the President of the Republic of Cyprus, an office held by Mr. Spyros Kyprianou since Archbishop Makarios's death in August, 1977. Direct political control and responsibility is exercised by the Minister of the Interior and Defence, currently Mr. Christodoulos Veniamin. There remains a small number of mainland Greek army officers serving with the Cyprus National Guard on detached duty, but it is less subject to control from Athens than at any previous time in its history.

The 'Turkish-Cypriot Security Force' was created by the National Assembly of the Turkish Federated State of Cyprus in a law of November 24th, 1976 to serve as the regular army of that State, itself only proclaimed in February, 1975. It is the old 'Turkish Fighters' militia of the Turkish-Cypriot community in a new guise, and like its predecessor is principally officered by members of the Turkish army on secondment who have years of experience in Cyprus. The new army is commanded by a brigadier-general of the Turkish regular army, but for constitutional purposes he is responsible directly to the President of the T.F.S.C., Mr. Rauf Denktash, whom he advises on all matters of security. There is a Minister of Defence, but the army commander is in control of both administration and operational functions. He also controls the police and the radio station.

British forces in Cyprus are controlled by the Ministry of Defence in London. UNFICYP is commanded by Major-General James Quinn of the Irish army, who is responsible to the Secretary-General of the United Nations.

The Commander-in-Chief of the Turkish army forces in Cyprus is responsible to the Ministry of National Defence in

Ankara, and is not under the command of the President of the T.F.S.C. He is also martial law commander in the Turkish-occupied part of the island.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role, Commitment and Deployment

The Cyprus National Guard, deployed throughout the Greek-Cypriot controlled south of the island, has the primary role of defending that territory, but is manifestly incapable of doing so against the Turkish forces now in Cyprus, should they be ordered to advance further. Its more significant role, therefore, is to maintain the authority of the elected government in the face of the still numerous irregular armed groups illegally maintained by political organisations, notably those of the EDEK party and of the banned EOKA-B.

The Turkish-Cypriot Security Force is deployed throughout the north of the island, and serves as an auxiliary to the Turkish regular army in the defence of the territory and in the various civic action programmes undertaken by the latter. It has little real autonomy.

The British forces are in Cyprus by bilateral agreement, not as members of NATO, but it is nevertheless in the latter capacity that their presence is of strategic significance. Before the 1975 British Defence White Paper there were two squadrons of Vulcan nuclear bombers protected by Lightning fighters based on Cyprus, but the RAF no longer maintains combat aircraft in the island. Its facilities — a large military airfield, an electronic surveillance station at Dhekelia, the huge RAF radar station in the Troodos mountains — nevertheless remain valuable to NATO in the eastern Mediterranean, and may indeed have grown in value since the post-1974 American difficulties with base rights in Greece and Turkey. (The USAF's daily U-2 reconnaissance flights over the Sinai peninsula, for example, are flown from Akrotiri.)

On calculations of purely national interest, Britain might well abandon its extensive Cyprus base areas — which cover 3% of the island's territory — but it maintains its presence in the interests of NATO. A further consideration is the probability of a further Turkish military advance if the airbase were to become available to the Greek air force, or if Greek-Cypriot forces were enabled by a British withdrawal to occupy the Sovereign Base Area of Dhekelia, which runs right up to the suburbs of Turkish-occupied Famagusta. The 4000 British servicemen in Cyprus are roughly evenly divided between the army base at Dhekelia and the air force installations at Akrotiri.

UN peacekeeping forces in Cyprus are headquartered in the Greek part of Nicosia, but are deployed throughout the island. Their initial function was to safeguard the fragile ceasefires established in the days when Greeks and Turks lived in closely intermingled communities in all of Cyprus, and has thus been much eased by the far clearer single dividing line established since 1974. Their duties are solely those of surveillance and mediation, and they are authorised to use their weapons only for self-defence.

Turkish army forces in Cyprus are deployed throughout the northern part of the island. Their task is to maintain the security of the Turkish-Cypriot community and to maintain the borders established in 1974 until and unless they should be modified by negotiations. They serve the additional unstated purpose of providing a most persuasive deterrent against any attempt by frustrated Greek Cypriots to engage in any form of guerrilla attacks against the Turkish areas, since they have the undoubted ability to seize the remaining three-fifths of the island in a very short time.

Recent Operations

During the 1974 crisis the Cyprus National Guard was employed first against the Special Police Reserve and other forces seeking to defend President Makarios's government, and less than a week later against the Turkish seaborne and airborne forces that intervened in the island. Despite the political turmoil in which the National Guard were inevitably caught up, it fought well in the battles against greatly superior Turkish forces. Much of its scanty armour and artillery was lost at the beginning in the morning of July 20th, in a futile attempt to defend the beaches west of Kyrenia against overwhelming Turkish naval and air forces, but it succeeded in keeping the strategic St. Hilarion Pass leading south towards Nicosia closed for the better part of 2 days against Turkish paratroops.

It did manage, just barely, to deny Nicosia airport to the Turks until the first ceasefire intervened on July 22nd (thus necessitating the construction since 1974 of new civil airports at Ercan and Larnaca to serve the two halves of the divided island). During the succeeding month it performed creditably enough around the fringes of the gradually expanding Turkish army lodgement, although shaken by yet another political upheaval in the Greek-Cypriot community when the result of the coup was reversed by the resignation of the Sampson government. Its resistance collapsed rapidly and completely, however, in the face of the second Turkish offensive of mid-August, which was launched by a force by then enlarged to 40,000 men and 200 tanks.

The other Cypriot armed force, the 'Turkish Fighters', as it was then called, played an entirely subsidiary role in the main operations in the north of the island in 1974, owing to the presence of Turkish regular forces. It did, however, succeed in defending most of the besieged Turkish-Cypriot communities out of reach of the Turkish army's protection in the south —

World Armies

most notably in the case of the Turkish quarter of Famagusta, which was under siege without water for over 3 weeks until relieved by the Turkish army.

For the Turkish army's role in the operations, see the entry on Turkey. Neither the British nor the UN forces in Cyprus took any part in the 1974 fighting.

ORGANISATION

Both the Cyprus National Guard and the Turkish-Cypriot Security Force are predominantly infantry organisations, although the former does have a small armoured force and light air wing for communications duties.

The British force in Cyprus consists of two infantry battalions and a reconnaissance force, plus RAF personnel.

UNFICYP is made up of infantry and military police contingents from seven countries: Australia, Austria, Britain, Canada, Denmark, Ireland and Sweden. The largest contributors are Britain (823 troops) and Canada (474 troops) whose contingents are regular force battalion units. The Scandinavian contingents consist mainly of military reservists recruited directly from civilian life.

The Turkish army in Cyprus is organised in the conventional pattern prevailing on the mainland.

RECRUITMENT, TRAINING AND RESERVES

The Cyprus National Guard is made up primarily of conscripts who join at the age of eighteen and do 2 years' service, after which they join a reserve (numbers unknown). They are trained by a small cadre of regular officers and NCOs, assisted by some Greek army regular officers on secondment. On mobilisation, the force can rapidly expand to about 40,000 men.

The Turkish-Cypriot Security Force consists of conscripts called up at eighteen, who serve for 30 months. They are trained by Turkish army regular officers on detached duty. The size of the reserve force is not known, but as in the Greek-Cypriot case probably involves a large proportion of the adult male population to a greater or lesser extent.

EQUIPMENT AND ARMS INDUSTRY

Both Greek-Cypriot and Turkish-Cypriot forces are armed mainly with light infantry weapons of the patterns used in the respective mother countries. Prior to 1974 the Greek-Cypriot forces possessed some dozens of antiquated armoured vehicles, but most of those were lost on the beaches at the time of the invasion. The Cyprus National Guard is now estimated to have some 20 tanks provided by the Greek army, and about 12 light aircraft. The Turkish-Cypriot equivalent is not known to possess similar items of equipment, but can rely on the overwhelming material superiority provided by Turkish regular forces in Cyprus (some 50 tanks at the moment, but easily reinforced) and by Turkish air force bases only a few minutes' flight time away on Turkey's southern coast.

There is no arms industry in Cyprus.

RANK, DRESS AND DISTINCTIONS

Both Turkish-Cypriot and Greek-Cypriot forces closely follow the models of the armies of the respective mother countries. The former, indeed, wear Turkish army uniforms, the only distinguishing feature being the cap-badge (a wolf's head instead of the Turkish army's crescent and star).

CURRENT DEVELOPMENTS

The Turkish government has repeatedly stated its goal in Cyprus to be the reconstitution of the Republic as a federal State incorporating two autonomous communal entities, each possessing very wide powers of self-government in its own zone. It has resisted pressure from the right wing in Turkey for annexation, and from the Turkish-Cypriot government for a declaration of full independence for the northern part of the island, and maintains that its forces would be withdrawn from the island once a federal solution has been negotiated.

By 1975 Archbishop Makarios had accepted this sort of settlement in principle, but the main stumbling block — apart from the abyss of mistrust separating the two sides — was the size of the Turkish component in such a federal Cyprus. The present Turkish-occupied area, at 36% of the island's surface, is approximately twice the proportion of Turkish Cypriots in the total population, although it corresponds somewhat more closely to the actual proportion of land registered to Turkish-Cypriot owners before the upheaval of 1974. Negotiations between the two Cypriot sides actually took place during the first half of 1977, but soon broke down on this question of how much land the Turkish Cypriots should hand

back. There has been no public discussion on what kind of army a federal Cyprus should have, although it seems certain that the Turkish Cypriots would insist on maintaining their separate force.

The death of Archbishop Makarios in August, 1977 probably removed the only Greek-Cypriot leader who could enter into real negotiations with the Turks and make genuine concessions on the territorial question without facing the near-certainty of overthrow by his own people.

The creation of a new Turkish government in early 1978 under Prime Minister Bülent Ecevit, with a considerably greater latitude for political concessions on the Cyprus issue than was enjoyed by the unstable coalitions of the previous 3 years, has resulted in a much more conciliatory attitude towards Greece by Ankara, which may have important consequences for the Turkish negotiating stance over Cyprus. (Ecevit personally met Greece's Prime Minister Karamanlis in March, 1978.)

Greek-Turkish disputes in the Aegean Sea, the resolution of the Cyprus problem, and the relations of Ankara and Athens with Washington (particularly over questions of American arms supplies) have become intertwined diplomatically, however, so any formal ratification of the new facts created in Cyprus in 1974, accompanied by territorial adjustments, seems unlikely in the near future. The departure of Makarios from the scene could open the door to factional infighting in the Greek-Cypriot community, and to a resurgence of private armies seeking unrealistic goals. The realities are plain to almost everyone, however (although Greek Cypriots find them very unpalatable) and it is therefore improbable that there would be any return to open hostilities in Cyprus.

GWYNNE DYER

CZECHOSLOVAKIA

HISTORY AND INTRODUCTION

Unlike Hungary and Poland, Czechoslovakia was not even a 'historical nation' when, in the autumn of 1918, she emerged from the dissolution of the Hapsburg Empire. Her territory included Bohemia, Moravia, Slovakia and part of Silesia, and contained not only Czechs and Slovaks but also Germans, Magyars and Ruthenians. Nevertheless, the new republic possessed excellent natural resources and thriving industry, and made steady progress under the sound leadership of Thomas Masaryk. It was, ironically, external pressure which aggravated the problem of national minorities and led to the republic's collapse. German *Anschluss* with Austria in March, 1938 was followed by agitation amongst the German minority of the Sudetenland (northern Bohemia) who demanded unification with the *Reich*. Czechoslovakia was abandoned by her allies at Munich in September, 1938; Germany annexed the Sudetenland in October, and Slovakia gained autonomy. The remnants of Bohemia and Moravia did not survive for long: in March, 1939 Hitler proclaimed them a German protectorate and his troops occupied them without resistance.

Elements of the Czechoslovakian army escaped abroad after the German invasion, and during World War II Czech forces were sponsored by both the western allies and the Soviet Union. In April, 1945 with the collapse of Germany imminent, Churchill and Truman agreed in principle upon the desirability of liberating at least part of Bohemia. In the event, however, the Americans decided to halt on the line Karlový Vary—Plzeň—České Budějovice, and it was Soviet tanks which swept into Prague in the first week in May. On April 4th a provisional Government of National Unity had been formed in Moscow under the pre-war President, Dr. Eduard Beneš, who had spent the war heading the London-based government in exile. The government was set up after a week's haggling between Beneš, aided by his Foreign Minister, Jan Masaryk, and the Moscow-based communists led by Klement Gottwald. Although the government contained only seven communists, they were an influential minority. It was also significant that the Ministry of War was entrusted to the 'non-political' figure of General Ludvík Svoboda, commander of the Czech corps which had been organised under Soviet auspices.

United States forces withdrew from western Bohemia in the winter of 1945, and with them went the last external source of support for anti-communist Czech politicians. The Czech Communist Party (KSČ) grew in strength, and obtained 38% of the popular vote in the first post-war elections, held in May, 1946. Not only was the KSČ the largest single party, it also possessed a narrow parliamentary majority, thanks to its alliance with the social democrats. Beneš therefore appointed Gottwald Premier, and the latter's 26 man cabinet included nine communists and three social democrats. This cabinet voted, rather surprisingly in view of its membership, to join the Marshall Plan, but Gottwald and Masaryk were summoned to Moscow where an enraged Stalin complained that this was an unfriendly act. The cabinet promptly reversed its decision, bringing Czechoslovakia firmly within the Soviet economic sphere.

Predictions that the communist share of the popular vote would be greatly reduced in the 1948 elections encouraged the communists to increase their propaganda and prepare for direct action. On February 13th, 1948 a crisis broke when the non-communist members of Gottwald's cabinet tendered their resignation. A Soviet minister, V.A. Zorin, warned Masaryk that 'reactionary elements' were at work within Czechoslovakia, and noted that the Soviet Union looked forward to Gottwald's eventual success. The veiled threat of Soviet intervention was not all Beneš had to contend with. The communist-dominated People's Militias were issued with arms and ordered to prepare for a struggle against 'reactionaries', and Svoboda warned that 'the army goes with the nation', and confined all senior anti-communist officers to their quarters. Beneš had no choice but to approve Gottwald's new cabinet, which contained a majority of communists. Masaryk remained Foreign Minister, but died in suspicious circumstances 2 weeks later and was replaced by the communist Vladimír Clementis.

The *putsch* of February, 1948 was followed by a rapid increase in Party membership, the removal of the Party's opponents from positions of power, and the introduction of a new constitution. The communists swept home with a massive majority in the May elections, and Beneš resigned rather than approve the new constitution; he died on September 3rd. Gottwald became President in mid-July, and Antonín Zápotocký took over as Premier. Gottwald himself died in April, 1953 but not before he had carried out a massive purge of the Party, the armed forces, the civil service and the church. Numerous communists of long standing perished; Svoboda himself was arrested in late 1951 and imprisoned for 'treason'. Despite the occasional glimmer of liberalism, Czechoslovakia steadily followed the Moscow line under the Presidencies of Zápotocký and his successor Antonín Novotný. There was, however, some relaxation after Josef Lenárt became Premier in 1963.

Novotný came under increasing pressure from students, intellectuals and Slovak nationalists, and in January, 1968 lost the first round of a struggle for power. The posts of President and First Party Secretary were separated, and, although Novotný retained the former office for the time being, the latter post went to the Slovak communist Alexander Dubček. It

was in an atmosphere of growing pressure for changes in policies and leaders that Novotný at last resigned as President, on March 22nd. The rehabilitated General Ludvík Svoboda was elected in his place; it was a significant coincidence that *svoboda* means 'freedom' in Czech.

Dubček's 'action programme' — an attempt to pursue a Czechoslovak way to socialism and to reject Soviet insistence on continued class struggle — was approved by the party's Central Committee in early April. Many of the victims of Gottwald's purges were rehabilitated, and there was a general air of hope and enthusiasm. This euphoria did not last long. Soviet pressure on Dubček increased, and the Soviet press hinted at 'counter-revolution' and 'reaction' in Prague. In mid-May a military mission under the Soviet Minister of Defence, Marshal Grechko, visited Czechoslovakia, giving rise to rumours of imminent Soviet military intervention. In late July the Soviet Politburo and the Czechoslovak Presidium met at the little village of Čierna-nad-Tisou on the border between Czechoslovakia, Hungary and the Soviet Union. The meeting resulted in the signing of the empty Bratislava Declaration on August 3rd, and did nothing to avert the Soviet invasion, launched late on Tuesday, August 20th.

Dubček and his colleagues decided, no doubt wisely, not to meet the invasion with armed resistance. There was, however, a good deal of passive resistance on the part of the civilian population, which suffered a number of casualties. Dubček was arrested, along with several other liberal politicians, and, although he was released shortly afterwards, the erosion of his power had begun. Most of the liberal measures of the 'Prague spring' were rescinded during the autumn, an amendment to the constitution made Czechoslovakia a federated State, and, in April, 1969 Dr. Gustáv Husák, Head of the Slovak Communist Party, was elected First Party Secretary in place of Dubček, who was subsequently sent to Turkey as ambassador. Dubček's complete disgrace was not long delayed; in late June, 1970 he was dismissed from his diplomatic post and expelled from the Party. There was no massive purge on the scale of 1951–2, but few of Dubček's supporters were allowed to retain any positions of power or influence. Oldřich Černík, Premier during the 'Prague spring' but an advocate of compromise following the Soviet invasion, was replaced as Premier by Lubomír Štrougal, a former close adherent of Novotný.

There have been relatively few changes in Czechoslovakia since the re-establishment of Moscow-dominated communism in 1968–9. Husák and Štrougal are First Secretary and Premier, respectively, and the aged Svoboda still inhabits Prague's Hradčany Castle. In 1973 Czechoslovakia made some efforts to normalise her foreign relations, and in December a treaty was concluded with the Federal Republic of Germany. It is unlikely that there will be another 'Prague spring' in the foreseeable future; the Soviet Union's determination to maintain an authoritarian communist regime in Czechoslovakia remains unaltered, and the five Soviet divisions currently stationed in Czechoslovakia lend weight to this determination.

STRENGTH AND BUDGET

Population: 14,949,000
 Army: 135,000
 Air force: 46,000; 558 combat aircraft
 Paramilitary: 10,000 Border Troops; 2500 Civil Defence Troops
 People's militia: 120,000
 GNP (1977 estimate): \$45,700,000,000
 Defence expenditure (1977): \$1,610,000,000

COMMAND AND CONSTITUTIONAL STATUS

Command

The President of the Republic is nominally Commander-in-Chief. In most other respects, however, the High Command of the Czechoslovakian armed forces follows the usual Warsaw Pact pattern, and the day-to-day running of the army is in the hands of the Minister of War, Army General Martin Dzur. Czechoslovakia is divided into two military districts. One, commanded from Prague, comprises Bohemia and Moravia, while the other, with its headquarters at Trenčín, covers Slovakia. Military district headquarters would possibly provide cadres for army headquarters on mobilisation.

Constitutional Status

The Constitution of July, 1960 made Czechoslovakia a Socialist Republic, and an amendment of October, 1968 introduced the current federal system. The federation consists of two nations of equal rights, the Czechs and Slovaks, forming two republics, each with its own government. The Federal Assembly, elected for 5 years, is the supreme organ of State power. It has two components: the House of the People, with members proportionate to the population of the republics, containing 138 Czechs and 62 Slovaks; and the House of Nations, with 75 members from each republic. The Federal Assembly elects the President for a 5 year term, and the President appoints the government, the supreme executive body.

World Armies

Each republic has its own government and elective National Council, and is responsible for all matters except foreign relations, overseas trade, communications and defence, which are specifically reserved for the federal government.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role and Commitment

The army has the customary dual role of defence against external enemies and the maintenance of internal security. Czechoslovakian propaganda tends to stress that the Federal Republic of Germany, probably acting as a tool of the United States, is Czechoslovakia's most likely enemy. The army is probably subject to a good deal of Soviet supervision even in peacetime, and in wartime would be controlled by a Warsaw Pact headquarters.

Deployment

The army forms five tank divisions, five motor rifle divisions and one airborne regiment. These were reorganised to conform with the Soviet pattern in the late 1950s and early 1960s, and are by no means all at full strength. It is probable that the majority of Czechoslovakian troops are stationed in the Prague military district. The group of Soviet forces in Czechoslovakia is commanded from Milovice, near Prague, but most of its troops are in eastern Czechoslovakia. This is an interesting contrast to the normal deployment pattern in which Soviet troops are usually stationed in the western districts of Warsaw Pact States.

Recent Operations

The Czechoslovakian army has been involved in no recent military operations; in 1968 it did not offer armed resistance to the Soviet invasion. It participates, however, in the normal run of Warsaw Pact military exercises.

ORGANISATION

Arms of Service

The Czechoslovakian army is divided into Arms (*Zbraně*), Auxiliary Arms (*Pomocné Zbraně*) and Services (*Služby*), as follows:

Arms: motor rifle, armour, artillery, engineers

Auxiliary Arms: signals, chemical troops, transport troops

Service: medical, quartermaster, ordnance, administration, justice, topographic.

Operational

Units and formations are organised on the Soviet pattern.

RECRUITMENT, TRAINING AND RESERVES

Recruitment

This is by means of conscription. Military service is for 2 years in the army, 27 months in the border troops and internal security forces, and 3 years in the air force. Sixty-six per cent of the armed forces are conscripts.

Training

This is similar to that of the Soviet ground forces. The army is subject to the same sort of political supervision that exists in other Warsaw Pact States, and political training takes up a significant proportion of training time.

Reserves

Males retain a general liability for military service until they attain the age of fifty. Conscripts pass onto the 1st Reserve on leaving the colours, and go onto the 2nd Reserve at the age of forty. The People's Militia, which played an important role in the crisis of February, 1948 is lightly equipped and carries out part-time training. There are about 305,000 army reservists.

EQUIPMENT AND ARMS INDUSTRY

Czechoslovakia is the most highly industrialised Soviet satellite. She has a thriving arms industry, and her armed forces use numerous Czech-designed and Czech-produced items of equipment.

Equipment

Small arms: M-50 machine pistol, 7.62 mm short, and M-24/26 machine pistol, 7.62 mm short; M-52/57 automatic rifle, similar to Soviet SKS (Simonov), for the 7.62 mm M-43 round; M-58 assault rifle, 7.62 mm M-43, very similar to Soviet AK-47; M-1952/7 7.62 mm M-43 belt-fed light machine-gun

Mortars: Soviet 120 mm and 82 mm

Anti-tank: P-27 Panceřovka rocket projector, similar to Soviet RPG-7; T-21 Tarašnice 82 mm and M-59A 82 mm recoilless guns; M-52 85 mm gun, similar to Soviet M-45, and M-55 100 mm gun, similar to Soviet M-55; the Soviet M-43 and M-55 are both in use

Anti-aircraft: DShK-Vierling quadruple 12.7 mm machine-gun (this is the Soviet DShK gun on a Czech-designed mounting); M-53 30 mm twin cannon; M-53/59 30 mm twin cannon on Praga V3S armoured vehicle; 57 mm cannon, similar to Soviet M-50; ZSU-23-4; ZSU-57-2

Artillery: Mainly Soviet-designed, including 85 mm, 100 mm, 122 mm, 130 mm, 152 mm gun-howitzer and JSU-152 heavy assault gun. The Czechs produce their own version of the BM-21 multiple rocket launcher; it is mounted on the TATRA-813 truck and has a 40-round reloader, enabling it to fire a quick second salvo

Armour

Tanks: about 3100 main battle tanks, mostly T-54/55, but some T-62s

APCs: SKOT (Středni Kolový Obojživelný Transportér) — eight-wheeled amphibious APC, carrying driver, commander and eight men; the Czech version mounts a 12.7 mm MG, while a Polish variant has a turret containing 14.5 mm and 7.62 mm MGs (also called OT-64). TOPAS (Transportér Obojživelný Pašový Středni) — tracked amphibious APC based on the Soviet BTR-50P; in several versions, one of which mounts a 57 mm recoilless anti-tank gun alongside the driver's compartment (also known as OT-62). OT-810 half-track APC, used instead of the BTR-152

Scout car: OT-65 (Hungarian FUG)

Missiles: Swatter, Snapper and Sagger anti-tank missiles; SA-2 and SA-7 anti-aircraft missiles; Frog and Scud SSMS (about 70, but without nuclear warheads)

Arms Industry

The Škoda factory at Plzeň had an international reputation for the manufacture of high-quality arms long before the birth of Czechoslovakia as an independent State, and the battle-tryed British Bren light machine-gun was modelled upon a weapon designed in Brno. The thriving Czechoslovakian arms industry currently produces a wide range of military equipment, and is easily the most important non-Soviet arms industry within the Warsaw Pact. Some Czech-produced equipment is, naturally, of Soviet design, or is closely based upon a Soviet prototype, but many such items — like the Czech version of the BM-21 — are substantial improvements upon the Soviet originals. Other equipment is of Czech design — the Tatra and Praga range of vehicles are particularly worthy of note. Czechoslovakia has had considerable success in the export of military equipment: the SKOT, for example, is currently in service in Poland, Hungary, Egypt, India, Morocco, the Sudan, Syria and Uganda.

RANK, DRESS AND DISTINCTIONS

Rank

All badges of rank are worn on the epaulette.

Officers

Armádni general	Gold-edged epaulette, four stars above crossed maces and wreath
Generálplukovník	Gold-edged epaulette, three stars above crossed maces and wreath
Generálporučík	Gold-edged epaulette, two stars above crossed maces and wreath
Generálmajor	Gold-edged epaulette, one star above crossed maces and wreath
Plukovník	Gold-edged epaulette, three stars with crossed maces above
Podplukovník	Gold-edged epaulette, two stars with crossed maces above
Major	Gold-edged epaulette, one star with crossed maces above

World Armies

Kapitán	Four stars with crossed maces above
Nadporučík	Three stars with crossed maces above
Poručík	Two stars with crossed maces above
Podporučík	One star with crossed maces above

Officers' stars and buttons are gold. Stars are arranged as follows: generals — stars one above another; plukovník, nadporučík — stars in inverted 'V'; kapitán — stars in inverted 'Y'; podplukovník and poručík — stars side-by-side.

Warrant Officers

Nadpraporčík	Silver-edged epaulette, three silver stars, one above another
Praporčík	Silver-edged epaulette, two silver stars, one above another
Podpraporčík	Silver-edged epaulette, one silver star

Regular NCOs

Nadrotmistr	Three silver stars, one above another
Rotmistr	Two silver stars, one above another
Rotný	One silver star

Conscript NCOs and men

Četař	Three round white studs, side by side
Desátník	Two round white studs, side by side
Svobodník	One round white stud
Vojín	Plain epaulette

Dress

There are five basic forms of dress with certain variations. Ceremonial parade dress (which is relatively uncommon), parade dress and walking-out dress are based upon an olive-brown tunic with open collar and four pockets, worn with a light khaki shirt, black tie and olive-brown trousers. Embellishments depend upon the order of dress: black- and yellow-braided belts are worn in ceremonial dress; leather belts, with Sam Brownes for officers, are worn in parade dress; while in walking-out dress no belts are worn. Black boots and gaiters are worn in ceremonial parade and parade dress, and shoes are worn in walking-out dress. Officers, warrant officers and regular NCOs wear an olive-brown peaked cap in all the above orders of dress, but conscripts wear an olive-brown sidecap in walking-out dress.

For everyday wear in summer, officers and soldiers have a greyish shirt-blouse of *blouson* cut; this garment has an open neck and two breast pockets, is buttoned at wrist and waist and is worn outside the olive-brown trousers. A green combat suit with brown camouflage dashes, with camouflaged field cap or steel helmet and black boots and gaiters, is worn in field dress. The Czechoslovakian army employs the usual specialist clothing. NBC suits and tank-suits are of the Soviet pattern, and parachute units have a special mottled combat suit and brown leather protective helmet. Tank crews and paratroopers wear berets in certain orders of dress; those of the former are black, and those of the latter red. Olive-brown double-breasted calf-length greatcoats are worn, with most orders of dress, in the winter. Arm of service badges are, in the main, self-explanatory. The cap-badge consists of a lion rampant on a pentagonal shield, and a national red, white and blue roundel is worn on the left upper arm in most orders of dress.

Distinctions

Numerous decorations, among them the Military Order of the White Lion for Victory and the General Milan Rostislav Štefánik 'Sobol' award, were in use before 1955. In the latter year several new decorations were instituted, most of them with precise Soviet equivalents. The Order of Clement Gottwald is the Czech equivalent of the Order of Lenin. The Order of the Red Banner, Order of the Red Star, Medal for Merit in the Defence of the Homeland and Medal for Service to the Homeland are awarded for outstanding achievement, meritorious service and long service.

CURRENT DEVELOPMENTS

The morale of the Czechoslovakian army undoubtedly suffered as a consequence of the events of 1968. It has probably recovered very considerably by now, and there is no reason for supposing that the Czechoslovakian army would be anything but reliable if called upon to act in concert with other Warsaw Pact forces.

RICHARD HOLMES

DENMARK

HISTORY AND INTRODUCTION

Like its neighbour Sweden, with which for several centuries it disputed the mastery of the Baltic sea and coasts, Denmark is the inheritor of a great military tradition, but also the protagonist, in more recent times, of a strong and idealistic creed of neutrality and pacifism. Belief in this creed, at the peak of its strength before World War II, was seriously undermined by German behaviour to Denmark during 1940–45 and, in the post-war years, Denmark has adopted a more partisan foreign policy and a more robust defence posture than at any time since the mid-nineteenth century. Pacifist and neutralist tendencies remain strong nonetheless, and are reflected in the reductions Denmark has recently made in the size of her armed forces, in the numbers conscripted for military service and in the length of the conscripts' terms.

The pacifist strain in Danish politics may be due in part to the fact that the army, unlike the Swedish, lacks really deep roots as a popular institution. In the eighteenth century the powerful land-owning nobility obliged the monarchy to introduce a measure, known as the *Stavnsbaand*, which bound the peasantry to their estates — a return to feudalism — obliged them to perform free labour and used the threat of conscription into the army against those who proved refractory. The system was abolished in 1788 but the army retained its status as an oppressive instrument of State power. The campaign to retain the 'Duchies' — the partly German provinces of Schleswig-Holstein — in 1848–50 aroused popular enthusiasm, which was further fuelled by the remarkable Danish victories of Fredericia, July 6th, 1849, and Isted, July 25th, 1850, over the army of the German Confederation. In addition the liberal Constitution of 1849 included Article 81, which made military service a universal obligation. However, the decisive success of the Prussian and Austrian armies in the Second Schleswig-Holstein War of 1863–4, the heavy casualties suffered in the concluding battle of Dippol, the economic crisis which resulted from the cost of the war, and the loss of population and territory, all contributed to put an end to Denmark's aspirations to independent military power.

For a country which had, at various times in the past held the crown of England; headed a Union of all the Scandinavian countries (and retained Norway until 1814); ruled the islands of the north Atlantic (Greenland and the Faroes remain Danish); owned territory on the southern Baltic coast as far east as Estonia; founded trading stations in West Africa and the East and West Indies; maintained a navy of European importance; and, between 1429 and 1857, exacted dues from all shipping passing in and out of the Baltic, the defeat of 1864 therefore marked a revolution in national affairs. The Danes accepted its logic, nevertheless, with remarkable realism, the only domestic military disputes ensuing up to the outbreak of World War II being over exactly how small an armed force they should maintain. Until 1901, defence expenditure was concentrated on fortifying Copenhagen against a future German attack. Thereafter the impossibility of resisting a German invasion was recognised, and Denmark adopted a policy of seeking to convince Germany that she 'could be trusted to defend herself against aggressors harbouring hostile intentions against Germany'. As a result, she agreed to mine the Great Belt at the outbreak of World War I. After the war, the coalition of Social Democrats and the pacifist Radical Liberals which held power for most of the inter-war period and became one of the governments most strongly committed to the League of Nations' ideals, adopted a completely neutralist policy and reduced the Danish army almost to a token force.

The advantage which Germany took of Denmark on April 9th, 1940 when the country was invaded without warning, and the ordeal of occupation, which took the form of German military government after 1943, produced a strong reaction against neutralism in post-war Denmark. Some attempt was first made to find future security in a pan-Scandinavian defence union but eventually the country decided to accede, with certain limitations (*see under* Command and Constitutional Status) to NATO. All three services were considerably enlarged from the pre-war size and expensively re-equipped, with American aid.

An interesting and significant post-war development was the creation of the Home Guard (*Hjemme Vaernet*). A voluntary organisation, now 70,000 strong, it was founded upon, and largely by, the Danish resistance movement in 1945 and achieved statutory recognition in 1949. Initially it represented a certain popular contempt for, and suspicion of, the regular army, which had not opposed the German invasion (chiefly because it had been given no orders to do so). In addition it had remained in existence under German occupation until 1943 and had provided formed contingents to the 'foreign volunteer units' of the *Wehrmacht* and the *Waffen SS* for the campaign in Russia. In a sense therefore, the Home Guard represents an 'alternative' military principle in Danish life, and stands as a keeper of the nation's military conscience. Though the enthusiasts who brought it into being are now being taken from it by age, it continues to maintain its strength, all the more remarkable when compulsory military service in the standing army grows apparently more unpopular with young Danes.

World Armies

STRENGTH AND BUDGET

Population: 5,091,000

Army: 22,000 plus 70,000 reserves

Navy: 5800 (2 frigates, 6 submarines, 60 smaller vessels)

Air force: 7100; 116 combat aircraft

Home Guard: 70,000 (voluntary)

GNP (1976): \$34,200,000,000

Defence expenditure (1977-8): \$1,080,000,000

Denmark publishes a combined defence budget, in which the army element is difficult to isolate. As a result of the 1973 agreement between the major parties, defence expenditure is to be calculated in April, 1972 prices over the fiscal years 1973-7 inclusive and to rise somewhat. During the same period, as a result of the move towards substituting regulars for conscripts in the Standing Force and the consequent saving in training costs, it is expected that the sums available for procurement will somewhat increase. The army has several major items of equipment (*see under* Equipment and Arms Industry) which it intends to add to its inventory during the term of this defence budgetary period.

COMMAND AND CONSTITUTIONAL STATUS

Constitutionally, the Sovereign is Head of the Armed Services. In practice, command resides with the Ministry of Defence and the services.

Denmark has a unified defence ministry and a single defence command. The Chief of Defence, Head of the Defence Command, is a serving officer, whose Deputy is the Chief of the Defence Staff; together with the Chiefs of the Army, Navy and Air Force and the Commander, Danish Operational Forces, they form the Defence Council. Operational control of the army, as one element of the forces, rests with the Chief of Defence; but at a time of tension he may transfer command to the Commander Danish Operational Forces; as explained in the next section, the Commander Danish Operational Forces is also the NATO Baltic Approaches Commander (COMBALTAP) who, when appropriate, transfers Danish forces to NATO control, which he then exercises as a NATO commander; his Principal Land Subordinate Commander (COMLANDJUT) is alternately a Danish and then a German officer.

The Head of the Army is not an operational commander, though he is operational adviser to the Defence Commander in the Defence Council; his principal service role is as inspector of his own service and commander of the army's schools and training function. He is not head of the army element of the Home Guard, which is directly subordinate to the Ministry of Defence through its own Home Guard Command; at the head of that command are a Civilian Commissioner and a Military Commander, who is also Inspector of the Army Home Guard.

Parliament (*Folketing*) exercises very close supervision over Danish defence, and all recent defence legislation has come about as a result of political bargaining between the main parties. During debates on defence matters, Parliament calls the heads of the various services to give evidence before it, and to submit papers directly to it.

Denmark has a written constitution, Article 81 of which lays down the duty of 'every man capable of bearing arms . . . with his own body to contribute towards the defence of his native land'. The successive Defence Acts (the most important are those of 1950, 1960, 1969 and 1973) also have constitutional force, as do the General Operational Instructions issued as a Royal Decree of March 6th, 1952 and amended on April 26th, 1961. This remarkably forthright document, framed in the light of the events of April 9th, 1940, lays on all Danish servicemen the duty of resisting violation of the national territory without waiting for receipt of orders, disobeying orders to cease fighting unless their legal validity is established beyond doubt, and disregarding orders issued by superiors who have fallen into enemy hands.

The right of conscientious objection is recognised and about 15% of eligible Danes invoke the right annually. A code of military law exists and military courts have jurisdiction over servicemen.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

The peacetime role of the Danish army has been officially defined as 'participation in the surveillance of Danish territory, repelling of violations of Danish land territory, preparation for the execution of war tasks, through its peacetime existence to contribute towards forcing a potential aggressor to take such preparatory measures so that his intentions will be revealed in due time and, at an alert, to guard and secure such installations which are of importance to the overall national defence'; the wartime role is defined as countering a surprise attack and gaining time for mobilisation, maintaining the fight to allow Allied forces time to arrive and then continuing the fight jointly with Allied forces.

Commitment

Denmark is a member of NATO. Her ground forces are subordinate to the Commander Danish Operational Forces who is also always NATO Commander Allied Forces Baltic Approaches (COMBALTAP). He is subordinate, as a Danish national commander, to the Chief of Defence and so to the Danish government; as a NATO commander he is subordinate to CINCNORTH but the superior of the NATO Commander Allied Land Forces Schleswig-Holstein and Jutland (COMLANDJUT), alternately a Danish and then a German officer who commands both Danish and German ground forces (the latter the 6th Panzer Grenadier Division). The Danish land forces are therefore under the control of a NATO commander and are earmarked for NATO commitment, but will be transferred to NATO command only at the decision of the Danish government. The Local Defence Forces, the Home Guard and any part of the Field Army in Western Land Command, which is excluded from the agreement with NATO, would remain at all times under Danish national command.

The Danish United Nations Battalion, which is financed by the Ministry of Foreign Affairs, forms part of the joint Scandinavian force made permanently available to the United Nations and is either abroad on emergency duty (at present it is in Cyprus) or on call.

Although a full military member of NATO, Denmark does not permit the stationing of foreign troops on Danish soil (except in Greenland) and, until 1963, did not allow foreign NATO troops to exercise on her territory. She still does not allow foreign NATO troops to set foot on Bornholm, out of deference to the Soviet view that that island was evacuated by Russian troops in 1946 on such an understanding. She does not allow the stationing of nuclear weapons on her territory.

Deployment

Operationally, the Danish land area is divided into a Western Land Command, Eastern Land Command and the Bornholm Region. Eastern Command contains two of the Standing Force brigades, Western Command the other three. Bornholm contains an independent force consisting of an infantry battalion and some armour and artillery. For territorial defence, Denmark is divided into seven regions, three in Jutland, one in Funen, two on Zealand and one on Bornholm, under which are subordinated the 500 Home Guard companies and the 21 Local Defence Forces battalions.

Recent Operations

The Danish army has not been to war since 1864. It sent medical units, under United Nations auspices, to the Korean War, 1950–3.

ORGANISATION

The army is organised into supply troops, signals, engineers, artillery, army aviation, infantry and armoured troops (ex-cavalry). The latter include the old regiments of infantry and cavalry, some of which trace their origin to the seventeenth century — the Jutland Dragoons (1670), the Guards Hussars (1762), the Zealand (1614) and Funen (1614) Life Regiments, the Schleswig Regiment of Foot (1778), the Kings and the Royal Footguards — and which form the link between the standing and the reserve army. The 1st battalions of these regiments belong to the standing force and are manned by regulars, the 2nd–4th battalions are training units or belong to the Local Defence Forces. The other corps serving the army are tri-service: the Judge Advocate Corps, the Medical Corps, the Defence Construction Service, the Quartermaster Corps and the Defence Intelligence Service.

Operational Divisions

The army is divided operationally into the Field Army, which is earmarked to operate with NATO, and the Local Defence Forces. The Field Army consists of three elements: the Standing Force and the Augmentation Force (together known as the Covering Force), and the Field Army Reserve, consisting of the Covering Force Reserve and other reserve (mainly support) units. The Covering Force consists essentially of five small armoured infantry brigades, three on Jutland and two on Zealand, each of which contains an armoured infantry battalion (two armoured infantry companies and one tank company); a tank battalion (two tank companies and one armoured infantry company); an artillery battalion (two SP howitzer batteries and one air-defence battery); and an armoured reconnaissance squadron. In addition there also exists an infantry battalion on Bornholm and the Royal Lifeguard Battalion at Copenhagen. The Augmentation Force consists of company-sized units sufficient to add a company to each of the Standing Force battalions; the Covering Force Reserve would add one armoured infantry battalion and one motorised infantry battalion to each of the brigades.

The Local Defence Forces, based on the seven military regions, consist of seven headquarters companies, 21 infantry battalions, seven artillery battalions, seven engineer companies and some tank-destroyer squadrons; the infantry battalions are not equipped for mobile operations and are formed of reservists, who do only a few days annual refresher training, and who would probably come into existence only on mobilisation. The Home Guard, a voluntary organisation 55,000 strong,

World Armies

forms about 500 local defence companies; the personnel keep their weapons and equipment at home. The numerical strength of the various categories are: Field Army Standing Force, 8500; Field Army Augmentation Force, 4500; Field Army Reserve, 41,000; Local Defence Forces, 24,000; Home Guard, 55,000. To these should be added a Training Force of 5750 (engaged in training conscripts and reservists), 7250 in headquarters, depots and schools, and a United Nations Battalion of 500.

RECRUITMENT, TRAINING AND RESERVES

Conscription remains (in strict constitutional theory) the principle on which all the Danish armed forces have been recruited since 1849. As a result of the defence agreement concluded between the four major parties in 1973, however, the attempt has recently been made to increase the proportion of regulars serving in the forces, with the object of manning the Standing Force wholly, and the Augmentation Force partly, with regulars, retaining conscripts only in the training units to provide reservists for the Field Army Reserve. The term of service for the conscripts was reduced to 9 months in 1973; regulars must enlist for 54, 63 or 72 months.

Training is at present carried out in the training battalions of the regiments (the active battalions of which form the units of the Standing Force) and, for specialists, in the various schools. In future, training is to be concentrated in the schools; all artillery personnel, for example, will be trained at the Army Fire Support School at Varde, West Jutland, and all infantry personnel at the Army Combat School at Oxboel, West Jutland. Conscript NCOs and officers are also trained at these schools, senior NCOs and officers having to serve for 18 months instead of nine. Regular officers are trained at the Defence College, Copenhagen, a tri-service institution which is also the staff college.

The Home Guard recruits are trained in Home Guard centres near their own homes, either in their spare time or in periods of 4 days for which compensation for loss of wages may be paid. In the first year recruits train for 100 hours per year, in the second and third year for 50 hours per year, thereafter for 24 hours per year.

The reserves are formed, for the most part, of complete units of ex-conscripts who started their service together. After completing their 9 months' training, they proceed *en bloc* to the reserve, either by way of the Augmentation Force, with which units remain for 18 months, or directly to the Field Army Reserve or the Local Defence Force, with which the unit remains for 5 years. The reserve liability then effectively ceases; except for the shorter duration of the reserve liability, this system of *en bloc* transfer of trained conscript units to the reserve is similar to the Swedish. Reserves number about 70,000 (Augmentation Force 4500, Field Army Reserve 41,000 and Local Defence Forces 24,000).

EQUIPMENT AND ARMS INDUSTRY

Denmark formerly possessed an important source of small-arms manufacture in the firm of Madsen, a pioneer manufacturer of automatic weapons, but the firm has now given up armament work. The country's armed forces have, since the war, been re-equipped with foreign military equipment, largely at American expense, though that aid ceased in 1967. The additional burden that has been thrown on the Danish budget is one of the principal reasons underlying the political campaign for the reduction in the size and capabilities of the armed forces. Re-equipment is nevertheless proceeding; major items to be procured in 1975-7 include Leopard tanks to replace the ageing Centurions; a replacement for the army and Home Guard rifle; and other items such as APCs, vehicles, radios, artillery VT-fused ammunition, tank ammunition, fixed-wing aircraft, land mines, electronic equipment and radios.

Equipment

Pistol: 9mm Browning FN

SMG: 9mm M49 Hovea (Swedish Husqvana)

Rifle: 7.62mm GM 50 (the American M-1 Garand, converted by Beretta) and 7.62mm GM 66 (German G-3, replacing the above)

Machine-gun: 7.62mm MG 62 (German MG42/59, Rheinmetal)

Mortars: 60mm M/51 Fa (USA), 81mm M/57 Fa (made by Danish Vabenarsenalat) and 120mm M/50 Fa (Hotchkiss-Brandt) Vabenarsenalat

Anti-armour weapons: 84mm Carl Gustav RCL (Swedish); 106mm M56 RCL (USA) and TOW guided missile (USA)

Air-defence weapons: Redeye SAM (USA) and 40mm L/70 Bofors gun (USA: equips the air-defence batteries of the armoured infantry brigades)

Artillery: M-109 SP howitzer (USA; equips the artillery battalions of the armoured infantry brigades; 72 in service) and M-55 203mm howitzer (USA; 12 in service)

Armour: M-113 APC (USA; equips the infantry companies of the armoured infantry brigades; 650 in service); Centurion tank (Britain; equips the tank companies of the armoured infantry brigades; 200 in service); Leopard 3 tank (Germany;

replacing 120 of the Centurions); M-41 light tank (USA; equips the armoured reconnaissance companies of the armoured infantry brigades; 48 in service)

Aircraft: OH-6A Hughes helicopters (12 in service); C-18C light aircraft (22 in service); 12 KZ VII light aircraft (12 in service)

There is a variety of older equipment in use by the Reserve, the Local Defence Forces and the Home Guard, including towed 155mm howitzers and guns and 105mm howitzers (270 pieces in all).

RANK, DRESS AND DISTINCTIONS

Rank

General (General)	Three large gold stars
Generalløjtnant (Lieutenant-General)	Two large gold stars
Generalmajor (Major-General)	One large gold star
Oberst (Colonel)	Three smaller gold stars
Oberstløjtnant (Lieutenant-Colonel)	Two smaller gold stars
Kaptajn (Major)	One smaller gold star
Kaptajnløjtnant (Captain)	Three small gold stars
Premierløjtnant	Two small gold stars
Løjtnant	One* small gold star
Sekondløjtnant	One small gold star
Overfenrik	Four chevrons, point up, three arcs under
Fenrik	Four chevrons, point up, two arcs under
Oversergent	Four chevrons, point up, one arc under
Sergent	Three† chevrons, point up
Korporal	Two† chevrons, point up
Overkonstabel I	Three bars
Overkonstabel II	Two bars
Konstabel	One bar

Note: officers' badges are worn on the shoulder strap, other ranks' on the upper sleeve; * also with a gold triangle; † also worn with an arc if the wearer is a regular

Dress

For everyday wear a khaki uniform of British 'battledress' style, with beret or side-hat; the combat dress is green, worn with the NATO steel helmet; a walking-out dress of dark-green jacket and dark-grey trousers has recently been issued. The Royal Lifeguard wear on ceremonial occasions an early nineteenth century uniform of bearskin cap, scarlet tunic, white crossbelts and sky-blue trousers.

CURRENT DEVELOPMENTS

Defence policy is traditionally a matter for hard bargaining between the parties, of which there are more than in most Western democracies and of which several have long-established pacifist beliefs. It is against this background that Denmark's recent reduction in the size of the armed forces should be seen; and if the defence policy of the mushroom Poujadist Progressive Party (which won 28 seats in the *Folketing* in December, 1973 and advocated disbanding the armed forces and installing an automatic telephone system which would say 'We surrender' in Russian) appears eccentric, it should be remembered that the respected Social Democrats had suggested in the 1930s reducing the Danish army to a 'watch' of 800 men.

In domestic terms, therefore, the current downward trend of military investment and of the liability to conscription is understandable. Its sense is reinforced by the fact that Denmark lacks geographical defences: it is almost completely flat, and Jutland, the peninsula, has no important water obstacles. The hostility of males of military age (only one-third of whom are required for military duty) to conscription, and the high rate of registrations of conscientious objection (15%) may also be seen as an exaggeration of a phenomenon almost world-wide in the 1970s. And there remains among all Danes a fear of German intentions towards their country and suspicion of the long-term consequences of close military association with Germany in NATO.

Nevertheless, even if it is argued that the defence establishment erected by the 1960 Defence Agreement was too large for the Danish population and economy to support, and if it is accepted that the 1973 Defence Agreement between the parties

World Armies

(including for the first time the anti-military Radical Liberals) allows for a larger establishment than proposed by the long dominant Social Democrats in 1970 (which would have reduced the conscript's term to 5–6 months and the size of the Standing Force to 7000), the new defence establishment is a matter of legitimate concern, which has been forcibly expressed to the NATO Defence Planning Committee. Its views, as they affected the new organisation of the Danish army (reduced since 1970 from 20 to 14 first-line battalions), was that the shortening of the conscription term (from 14 to 9 months since 1969) would 'diminish the effectiveness of units manned mainly by conscripts and reserve personnel' (i.e. the Augmentation Force), and that it would entail the devotion of a larger proportion of the defence budget to personnel at the expense of 'much needed re-equipment'. It did not mention, though it might have done so, that the new Danish 'brigades' are possibly the smallest formations in any European army to be accorded that designation (they are in effect only battle groups). It did, however, touch upon the most serious consequence of the diminution of Danish first-line ground defence: the protection of the Baltic outlets. The Danish army could never have been expected to contribute largely to NATO's order of battle on the Central Front, but the Soviet bloc possesses a sizeable amphibious force in the Baltic, including a Polish amphibious division, an East German special forces group and a Russian naval infantry division, which might be expected to have the islands and peninsula of Denmark, which block egress to the North Sea, as its principal objective. The new Danish army can scarcely provide a credible defence of its coastline and, until it is re-organised and re-equipped to do so, must be counted a weak link in NATO's chain of defences.

JOHN KEEGAN

DJIBOUTI

The Republic of Djibouti is located on the northern coast of the Horn of Africa, on the southern side of the entrance from the Indian Ocean to the Red Sea. It has an area of 22,000 km², almost all of which is desert. Most economic activities of consequence revolve around the port city of Djibouti, which contains two-thirds of the population and is the seaward terminus of the only railway line linking the interior of Ethiopia with the sea. The non-urban population almost all live from their herds of goats and sheep, and lead a semi-nomadic existence. The city and the country of Djibouti owe their existence to this strategic location at the entrance to the Red Sea and to their economic role as Ethiopia's main outlet to the sea.

The country was created within its present boundaries by France in the late nineteenth century, to serve as a strategic French base in the area. The first French treaty with a local chieftain was signed in 1862, and by 1885 the whole of Djibouti's present territory was included within the protectorate's borders. It was an entirely artificial creation, as it straddled the boundary between the Somali-related peoples to the east, represented mainly by the Issa tribe, and the Afars (an Ethiopian nationality) to the west. There was an endemic hostility between these two ethnic groups, as Somali tribes had gradually been pushing westwards along the coast, driving the Afars before them, for centuries.

As a further complicating factor, both ethnic groups were part of far larger national entities beyond Djibouti's borders. The Issas regard themselves as part of the Somali people who occupy the Horn. The Afars of Djibouti belong to the Afar or Danakil group extending well inland and far up the Eritrean coast, which has traditionally struggled to maintain a wide degree of autonomy from the Ethiopian imperial centre in the highlands, and at the same time tends to regard itself as Ethiopian vis-à-vis the Somalis. The only significant unifying factors are that both the Issas and the Afars are Muslim and heavily Arabised, as a result of the influence of the Arabian peninsula across the Red Sea and of successive waves of Yemeni Arab immigrants over the centuries.

The Issas are the dominant ethnic group in Djibouti, having 50% of the entire population and about 80% of that in the capital, while the Afars, with around 40% of the total, predominate in the western three-quarters of the country. There also exists a 6% Arab minority, who control much of the wealth in the country and dominate trade and the skilled labour market in Djibouti town but have generally eschewed politics. The smaller European minority are almost all temporary residents. The population of Djibouti in 1976 was about 215,000 (of whom 13,000 were Europeans), plus an additional fluctuating population of about 40,000 nomads. The great majority of the population is extremely poor, the illiteracy rate is 90%, and the modern sector of the economy revolving around the port, the railway and the government services is so small that the unemployment rate in the capital is 85%.

Through the late nineteenth and early twentieth centuries the territory existed primarily as a minor French naval base, taking on some added importance and prosperity after the railway line to Addis Ababa was completed in 1917. It was proclaimed an overseas territory (TOM) of France under the name French Somali Coast in 1946, and a 20 member Representative Council was established. In 1957 this was replaced by a 32 member elected Territorial Assembly from which was chosen a Council of Ministers to run the local administration in co-operation with the French governor. In the following year the electorate voted two to one in favour of remaining part of the newly invented French Community in the referendum which was held in all French colonies in 1958. In the same year, however, came the first manifestation of internal trouble, when the Issa leader of the Council of Ministers and his colleagues were dismissed for having urged the voters to reject the new constitution that was adopted in the referendum.

What had happened was that the growing national consciousness and irredentist sentiment of newly independent Somalia was beginning to infect the Issa majority in Djibouti. The French response was to reorganise and limit the electoral register so as to ensure a majority of Afar voters. Pro-independence Issas were expelled, and a barbed-wire fence was constructed around the town of Djibouti and guarded by French soldiers to prevent a further influx of nomad Somalis. In this policy France had the whole-hearted co-operation of Ethiopia, which was also the subject of Somali territorial claims. (Mogadishu formally claimed all of Djibouti, the eastern fifth of Ethiopia, and much of north-east Kenya, on the grounds that they were inhabited mainly by Somalis.) Ethiopia was particularly concerned to prevent Somalia from gaining control of Djibouti as it would place the Somalis astride Ethiopia's main transport link with the sea.

In successive elections and referenda between 1958 and 1974 the link with France was reaffirmed and mainly Afar political parties were kept in power locally, due to the French policy of fixing the electoral register. From 1966 onwards, however, the governments of Ali Aref (the leading Afar political figure) and the representatives of the French colonial administration were the targets of repeated demonstrations, riots and terrorist acts, the latter being carried out principally by the Somali-based *Front de Liberation de la Côte des Somalis* (FLCS). This was accomplished by a steady rise in tension between Afars and Issas, and numerous violent inter-communal clashes. The number of French troops in the territory was augmented until it reached over 7000 men, but as late as 1975 the French government had no intention of allowing Djibouti its independence.

World Armies

A number of factors then conspired to cause a complete French about-face within a period of 5 months — between November, 1975 and April, 1976. One was undoubtedly the rise of a demand for independence amongst the Afars as well. This was triggered by the breakdown of central control in Ethiopia after the revolution there, which allowed an irregular force numbering some 6000 men called the Afar Liberation Front to establish effective control over the Afar-populated areas of Ethiopia adjacent to Djibouti. It seemed for a time that an Afar-led government taking Djibouti into independence would be able to unite with these territories and thus reduce the internal Issa majority to minority status, while also being able to resist pressures from Somalia or Ethiopia. Belatedly responding to this change in Afar nationalist opinion, Ali Aref changed the name of his party from 'Union and Progress within the French Community' to 'National Union for Independence' (UNI), but he moved too slowly. His party split and his support dwindled.

Other influences were also pushing the French to a reassessment of their policy in Djibouti. Demands by the anti-colonialist lobby at the United Nations, the Organisation of African Unity and other international bodies that France grant Djibouti independence, were becoming a serious embarrassment. In the course of 1975 both Ethiopia and Somalia gave assurances that they would respect the independence of a free Djibouti, thus ensuring that whatever arrangements France made for base rights in the country after independence would not be negated by the annexation of the country by one of its large neighbours. Above all, France's erstwhile collaborator in the region, Ethiopia, was turning increasingly to the Soviet Union for assistance, while Somalia in reaction to this was drifting towards closer ties with the West. Accordingly, an anti-Somali, anti-independence policy in Djibouti had become a liability, and France abruptly dropped it.

In December, 1975 France announced that the territory would be granted full independence, and then immediately shifted its support from the Afar parties to the main Issa party, the *Ligue Populaire Africaine pour l'Indépendance* (LPAI), led by Hasan Gouled. Leading LPAI members were released from jail or allowed to return from exile, the electoral registers were rectified and the number of qualified voters more than doubled within months, and an independence referendum was organised for May 8th, 1977. In the month before the referendum the main Afar parties, which had abstained from the pre-independence negotiations in Paris, announced their unconditional support for independence, and the referendum was carried by a 98% vote. The country became independent on June 27th, 1977 with Hasan Gouled as President, and a cabinet led by Prime Minister Ahmad Dini, a leading Afar politician, which contained a balanced mixture of Issas and Afars.

As the French had eventually realised, most leading Issa politicians in Djibouti were not in practice anxious to exchange their status of national leaders for that of provincial officials in an outlying province of Somalia, and the question of union with the latter was not raised. Within weeks of independence Djibouti joined the UN, the OAU and the Arab League. In a gesture intended to foster unity in the country by appealing to the two main groups' shared religious and cultural ties to the Arabian peninsula, Arabic was declared the country's official language. Moreover, as Paris had anticipated, the new government proved entirely willing to sign a military agreement with France which left it all its naval facilities and indeed retained almost the entire French garrison in the country.

The military agreement between France and Djibouti, signed on independence day, provided that over 4000 French troops should remain in the country, gradually withdrawing to a camp near Djibouti—Ambouli airport and handing over patrol and internal security duties to the new Djibouti army. They would be available for the defence of Djibouti against any foreign aggression, but would not assist in the maintenance or re-establishment of internal order. France would provide logistical support and technical assistance in the creation of Djibouti's armed forces, and provide them with appropriate training in French military schools or within the country. French forces stationed in the country in accordance with this agreement include two motorised regiments, the 5th Overseas Mixed Forces Regiment equipped with AMX-13 light tanks and ATGWs, a regiment of artillery, 12 Mirage III fighters and a helicopter detachment, and four patrol boats.

Moreover, Djibouti port remains available for the support of the French navy's Indian Ocean squadron, which is now the largest Western naval force in that ocean, usually including one aircraft carrier and about a dozen other surface combatants. The force's principal base is at the French island of Réunion, but Djibouti is of great strategic importance as the only remaining Western naval base in the sensitive north-western part of the Indian Ocean. Indeed, Djibouti faces what is becoming the Soviet Union's principal naval base in the region, Aden, across only 150 miles of the Gulf of Aden.

The Djibouti government's motives in making this agreement with the French are both economic and military. Local expenditure in support of the French military presence constitutes a substantial, perhaps irreplaceable, part of the exiguous national income. It was already evident at independence, moreover, that war was brewing between Ethiopia and Somalia, and that the main campaign would be fought near Djibouti's borders. The war duly came only a month later, and was fought out, with considerable participation by Cuban troops as well as Ethiopians and Somalis, during the remainder of 1977 and early 1978. Thanks partly to the deterrent of the French military presence, however, Djibouti remained untouched by it despite the country's vital strategic importance as the terminus of Ethiopia's only railway to the sea.

The internal compromise between the Afars and Issas in the government did not have a smooth course, however. In December, 1977 all but two of the seven Afar ministers in the government resigned protesting against the tribal politics they claimed were being pursued by the Issa President, Hasan Gouled. Another Afar, former Foreign Minister Abdullah Muhammad Kamil, was appointed Prime Minister in place of Ahmad Dini, and was given the portfolio of Defence Minister as well, but there were bomb explosions in Djibouti and accusations that Afars in senior civil and military posts were being systematically removed from office. France, without publicity, sent in another thousand troops.

In subsequent months four of the five Afar ministers who had resigned rejoined the government and the tension eased somewhat, but the main issues remained: the Afar demand that the constitution be revised to give the Afar Prime Minister

greater real powers to balance those of the Issa President, and the question of ethnic parity in the armed forces.

At independence Djibouti had regular and auxiliary military forces numbering 3000, of which 500 were gendarmes, 900 were 'Territorial Guards' and 500 were in the 'Autonomous Nomad Group' used for desert patrols. They were trained, armed and organised on the French model. The intention is to double the regular forces to about 2000 men (about 1% of the population), but there has been a discernible preference for recruiting Issas into this force.

Many Issas who were formerly members of the guerrilla organisation FLCS have been taken into the army, but the government is resisting an Afar demand that the 6000 men of the Afar Liberation Front who have been fighting in Ethiopia against the central government (many of them originally from Djibouti) be brought to Djibouti and enlisted in the army. The government has declared that it would only be prepared to assimilate between 700 and 1000 Afar fighters into the army. At the time of writing the dispute had not been settled, and neither the final size nor the internal communal balance of the Djibouti army were known for certain.

Djibouti's government has been coming under considerable pressure from victorious Ethiopia since February, 1978 to redress the ethnic balance in the army and government which, it is alleged, increasingly favours the Issas. So long as large numbers of French troops are stationed there, however, it is unlikely that this pressure will have decisive effect.

The strategic location of Djibouti and its considerable military facilities make it a most desirable base for any power with an interest in the Red Sea and Indian Ocean. So long as France retains an interest in the Indian Ocean, however, it is likely that Djibouti (with judicious Saudi prodding if necessary) will continue to grant the French navy port facilities. Likewise, so long as the French army is in Djibouti, there is little likelihood that the internal situation will get out of hand. Any question of union with Somalia has been dropped, at least for the moment, after that country's military disaster in February, 1978, while the French presence also helps to stave off Ethiopian meddling in Djibouti's internal politics.

GWYNNE DYER

DOMINICAN REPUBLIC

HISTORY AND INTRODUCTION

From the first days of its independence from Spain in 1821 the history of the Dominican Republic has been dominated by military events and military men, but it did not actually acquire a regular army in the contemporary sense until about a century later. Since then, it has usually been the new United States-founded regular army which has determined the course of Dominican affairs.

The island of Hispaniola, Spain's first base in the New World, rapidly lost its importance after the end of the sixteenth century, and a century later the western third of it was ceded by Spain to France. This has had a profound effect on shaping the Dominican Republic's environment and priorities, for shortly after the outbreak of the French Revolution the black slaves of Haiti revolted and seized control of that country.

With the support of French revolutionary troops Toussaint l'Ouverture's ex-slave army conquered the Spanish-ruled two-thirds of the island in 1801 and ruled it until the Dominican population revolted in 1808. They routed a French military force at the battle of Palo Hincado and completed the liberation of the Spanish-speaking part of the island with a successful siege of Santo Domingo.

The return to Spanish rule was short-lived, however, and the Dominican Republic's first experience of independence in 1821 even briefer, for in the following year it was overrun and subjugated once again by Haitian armies. The brutal 22 year occupation which followed is vividly remembered in the Dominican Republic even today as the 'Period of Africanisation', and left a lasting fear and suspicion of Haiti which has ever since been the principal public justification for a strong Dominican army.

Through the remainder of the nineteenth century the justification was not without substance, for although the Dominican Republic was refounded after a successful revolt in 1844 its Haitian ex-rulers made repeated attempts to reconquer it during the succeeding decades. Although the Dominican Republic itself has a far larger black element in its population than any other Spanish-speaking republic — 60% are mulatto and 12% black — the traditional hostility to Haiti has strong racial undertones. One of the military strongmen who ruled the republic during the 1860s, Pedro de Santana, even persuaded Spain to re-annex it as a means of gaining protection from the Haitian threat, but after a 2 year revolt Spanish rule was overthrown by the Dominicans in 1865.

Throughout the nineteenth and early twentieth centuries the Dominican Republic was a society dominated by a mostly white land-owning *élite* which monopolised both government and army senior ranks. The mass of the population lived in wretched poverty and ignorance in subsistence agriculture, or as landless labourers on the sugar-cane estates. Political power was extremely decentralised: there was nominally a national army and a central administration, but in fact most power usually lay in the hands of local *caudillos* who made themselves provincial governors and recruited military units under their own control.

There periodically arose more powerful *caudillos* who succeeded in hanging onto the presidency by establishing effective control over the provincial governors and their militias — notably General Ulises Heureaux, whose truly bestial tyranny lasted from 1882 to 1899. The more general pattern, however, was that of rapid changes of president brought about through often bloody civil wars, as one or another of the provincial governors expanded the forces under his control by the most brutal and arbitrary means of recruitment and made his bid for the top position. In the period 1844–1916 the Dominican Republic had 43 presidents, almost all 'generals' who had successfully promoted themselves from the ranks of the provincial *caudillos* — and 39 military uprisings.

At the end of each round of fighting the ignorant, impressed militia troops would be released or desert (if they had not already succeeded in doing so), and many would take their weapons with them and turn to banditry, while the national army would shrink to some scores of officers drawing regular salaries and little else. At the time of the American occupation in 1916, for example, the military budget provided for an army of 900 men, but most of the ranks were filled by 'phantom troops' whose salaries were pocketed by the officers. The forces that could be rapidly raised by any of the 10 provincial governors seeking to seize central power would so greatly outnumber this tiny force that the only defence available to the government was to authorise other loyal governors to expand their own military forces, and embark on yet another civil war.

This dreary succession of meaningless wars fought largely by unwilling and amateur armies was brought to an end by the United States occupation of the Dominican Republic in 1916. It was the natural conclusion of a process of growing United States intervention that had begun with the establishment of a customs receivership in 1905. As in the other United States military interventions which were taking place around the Caribbean at the same period (Haiti, Nicaragua, Cuba and Panamá), it proceeded from a desire to establish order in the interests of United States creditors and an overwhelming conviction of the exportability of American political institutions.

As in all the other cases, a key element in the USA's strategy for establishing order was the disbanding of the turbulent old armies and their replacement by efficient, non-political 'constabulary' forces. The result of this experiment, in the Dominican Republic as everywhere else, was to create new armies which were far more efficient in seizing and holding political power themselves. The noteworthy difference, in the Dominican case, was that the creation of this army transformed the social structure of the power-holding group.

The existing civilian and military *élite* of the republic were virtually interchangeable, both being derived from the same small class of wealthy land-owners. In contrast to the other United States interventions, however, the United States was unable to find collaborators from this group in sufficient numbers, with the result that in the case of the Dominican Republic the intervention was direct and total. On November 29th, 1916 the Dominican Republic was declared under the military administration of the USA, a force of United States Marines was put ashore, and the entire structure of government and army was taken over. For the next 8 years the Dominican Republic was ruled by a United States Military Governor advised and aided by a cabinet of United States Marine officers. One of their first measures was to deprive the semi-independent provincial governors of their military power and effectively to hand over their authority to American officers. By 1917 the army and navy had been abolished, United States Marine troops were acting as police in the cities and maintaining order (sometimes with extremely unfortunate results) in the countryside, and the creation of a new 'Dominican Constabulary Guard' was taken in hand.

However, this new centralised military force, trained and at the beginning commanded by United States Marines — almost all NCOs who were given temporary officer rank for the purpose — failed completely in its attempt to recruit Dominicans of education and some respectability to serve as officers. The old *élite* boycotted the new armed force being created by the occupiers, whose ranks were accordingly filled from the illiterate lower strata of Dominican society, while its officers were mostly adventurers of doubtful antecedents. The military efficiency of the Guard nevertheless progressed rapidly — the Haina Military Academy was founded 30 miles north of the capital in 1921, and alongside it a training centre for enlisted men — but the long-term result was the destruction of the political power of the Dominican Republic's traditional *élite*.

The outstanding representative of this process was Rafael Leónidas Trujillo Molina, a man of lower-middle-class origin and possibly the possessor of a criminal record (all records were subsequently destroyed in a providential fire) who joined the Guard as a second-lieutenant in 1919, and by early 1924 was a major and Commander of the North, holding one of the two senior field commands in the Dominican Republic's first centralised, modern army.

In 1924, satisfied that the conditions for public order had been established, the USA supervised the election of a civilian president and then withdrew the Marines, in confidence that the new constabulary force — now called the 'Dominican National Police' — would safeguard its achievement. In the succeeding 4 years Trujillo was promoted to lieutenant-colonel and Chief of Staff of the force, which was renamed the 'National Army' in 1928. By 1930 he was the most powerful man in the country, at the head of a powerful military force which had practically no ties or debts to the traditional power structure, and after a brief outburst of violence he was elected to the presidency unopposed.

Within a decade Trujillo had promoted himself to Generalissimo and renamed the capital city after himself. During his 31 years of rule he expanded the army to 15 times the size it had been at the time of the United States occupation, playing skilfully on Dominican fears of Haitian invasion, and he and his family and cronies ended up owning almost half the country's land and fixed assets.

Trujillo maintained his authority by a lavish use of the tools of terror that had traditionally been used by Dominican *caudillos*, but equally importantly by a lavish distribution of favours to the army's officers. He also created a counterbalancing force by building a relatively large air force which possessed its own tanks and troops, and deliberately encouraged the growth of rival cliques within the officer corps of both services. His was a new kind of dictatorship, perhaps the most absolute ever seen in Latin America: he promoted the growth of a personality cult of something approaching North Korean proportions, and personally ran or dominated every aspect of social, economic, intellectual and even religious life within his small empire.

By the time he was assassinated in 1961, he had ruled for twice as long as any previous Dominican dictator, a feat that can probably be attributed to the fact that he was the first of his kind to have a centralised and disciplined army at his command. But the sheer longevity and flamboyance of Trujillo tends to mask a more fundamental transformation that took place in the Dominican Republic during this period.

Up to 1916 the dominant group in Dominican society was a civilian/military land-holding upper class which used non-professional armed forces to settle its own quarrels over power. By the time Trujillo was killed a new and greatly privileged military caste, originally recruited from a quite different section of the population, was using a professional army to rule the Dominican Republic in its own interests. The old *élite* were virtually out of the running, and the only rivals to the military interest were the new social groups (business men, professionals and urban labour) which had grown up thanks to the very considerable economic growth the Republic enjoyed in the 1940s and 1950s.

By and large this privileged position of the Dominican officer corps has been preserved since Trujillo's death. It has long ago ceased to draw its members from its original ill-educated sources low down on the social scale, of course, for it is now one of the most attractive careers in the country; some of the better-educated entrants of more recent decades have even espoused reformist or socialist ideas.

The presence of such ideas — indeed, of any coherent political ideas — in the officer corps was not immediately evident

World Armies

upon Trujillo's death. His assassins were rival officers within the regime, most of whom were quickly hunted down, and for some months in late 1961 his son and heir retained control of the armed forces and governed through the puppet president Joaquín Balaguer. This successor regime rapidly collapsed under intense United States and internal pressure, however, and in 1962 the Dominican Republic had its first free elections in 38 years. Juan Bosch, a reformer of the democratic left who had American support, won the presidency, and his Dominican Revolutionary Party (PRD) swept both houses of Congress. But his reforms, and in particular his toleration of legal communist parties at a time when Cuba was spreading panic through the Caribbean, soon frightened sectors of the armed forces as well as the business *élite* and the church. Seven months after the election they combined to overthrow and deport the constitutional government. In its place they put a Triumvirate of civil politicians eventually led by Donald J. Reid Cabral, who was 'advised' by the high command of the armed forces.

The armed forces themselves were badly split by factional struggles, however. During 1963–5 different groups of junior- and middle-rank officers began to intrigue in favour of the ousted President Bosch or ex-President Balaguer (who had undergone a transformation in his post-1962 exile into the leader of the democratic centre-right). These rival groups, as well as idealists who simply wanted the armed forces out of politics and the holding of elections, and some simply ambitious or adventurous young officers, were engaged in almost continuous plotting during the last year of the Triumvirate, often in opposition to each other, but all under the same ambiguous banner of 'constitutionalism': the need to wipe out the effects of the 1962 coup. When economic crisis and an ill-advised drive against corruption in the armed forces lost Reid his last supporters in the business and military higher echelons during 1964, his overthrow became inevitable.

What started as a simple colonels' coup grew into a full-scale civil war accompanied by massive United States military intervention because of the differing goals and inevitable isolation of the various groups of military plotters, and the preconceptions and misinformation of the influential United States embassy. The coup that overthrew Reid in late April, 1965 was actually launched by a pro-Bosch group of officers amongst whom Police Colonel Francisco Caamaño Deñó eventually emerged as leader; most of the more senior army officers and the navy and air force high commands, however, distrusted Bosch and favoured the establishment of a military *junta*. Within a day the coup leaders controlled the Presidential Palace and central Santo Domingo, while air force planes and navy warships were strafing and bombarding the Palace and armoured units under the command of Colonel Elías Wessín y Wessín were attempting to fight their way into the city.

Disposing of relatively small regular forces, the Constitutionalist and leaders armed the urban populace and accepted support from various extreme leftist and communist groups. Wessín's tank forces succeeded at first in penetrating some distance into the city, amidst battles causing hundreds of casualties, most of them civilian. Within 4 days, however, the advance of Wessín's forces had been stopped, the morale of his troops collapsed, and the Dominican armed forces began to disintegrate.

The United States embassy, which had long since ceased to favour Bosch's return and supported the '*junta* solution' from the start, was growing increasingly panicky about the prominence of leftist groups in the Constitutionalist forces and entertaining visions of a 'second Cuba'. At this point, it recommended full United States military intervention. On April 30th the USA began to land a force of 23,000 Marine and army troops outside Santo Domingo. They were later given a scanty diplomatic covering by the dispatch of contingents numbering about 2000 troops from some Latin American countries, and the elevation of the whole into an Inter-American Peacekeeping Force under the auspices of the Organization of American States.

This intervention effectively smothered the fighting, and a ceasefire was signed on May 6th. Subsequent negotiations succeeded in re-unifying the armed forces under a single command, the main leaders of both factions including Wessín and Caamaño being sent abroad. The rest of the officers who had fought on the Constitutionalist side, it was agreed, would be reintegrated into the army. In September, 1965 a Provisional Government was established under a neutral civilian figure, Hector García Godoy, which ruled by decree until elections were held in June, 1966. Both Bosch and Balaguer returned from exile to contest the elections, which were won by the latter, and the OAS intervention force was then withdrawn.

Balaguer also won the 1970 and 1974 elections (unopposed), and proved to be a moderate and conciliatory president. He even tactfully attempted to reduce the influence of the armed forces and their share of the national wealth, by adroitly exploiting the intense and almost Byzantine rivalries amongst the various cliques of officers. The prevailing opinion within the officer corps as a whole, however, has been far to the right since 1965: the promise to re-integrate the rebel Constitutionalist officers into the army was generally ignored, and those few who gained re-admission were isolated at a single military base where they have remained. The armed forces were the most substantial obstacle to even the modest programme of reform that Balaguer has attempted to carry out in recent years.

Since 1961, with brief exceptions, the armed forces have not directly ruled the nation, but they continue to be a comparatively large force enjoying unusually generous pay and fringe benefits. The most significant indicator of the officer corps' actual position in the country and the economy is the fact that, contrary to the usual Latin American pattern, it is not private land-owners but the armed forces who have been the principal hindrance to land reform. Senior officers' perquisites included the right to concessions from the State Sugar Corporation to grow sugar on the vast State lands (the former possessions of the Trujillo family), the area of the concession corresponding to seniority. Few of them ever saw the land, but at harvest-time the State Corporation 'bought' the sugar from them. Understandably, the armed forces did not show much enthusiasm for redistributing these lands to landless peasants.

STRENGTH AND BUDGET

The strength of the Dominican armed forces in 1979 was 18,500 men. This represented a decline of about 1000 men since 1972. The navy and air force are unusually large in the armed forces compared to the Central American/Caribbean norm: the navy has 4000 men and the air force 3500, while the army amounts to 11,000 officers and men. The regular armed forces are only 0.37% of the population of 5,130,000. There are also 10,000 paramilitary gendarmerie.

Dominican military expenditure in 1977 was \$49,600,000, or 1.1% of the GNP of about \$4,300,000,000. This marks a continuous and relatively steep decline in the defence forces' share of the national income since 1964, when they were getting 4.3% of GNP, by far the highest in Latin America. The process of weaning the armed forces from the lion's share of government expenditure to which they were accustomed in the Trujillo years has been lengthy, but is now virtually complete.

COMMAND AND CONSTITUTIONAL STATUS

The 1966 Constitution describes the forces as obedient and non-political, with the purposes of defending the independence and integrity of the republic, maintaining public order, and upholding the Constitution and the laws. The President of the Republic, elected for a 4 year term, is Supreme Chief of the Armed Forces and Police Forces, but must not have engaged in any active military or police service for at least a year prior to his election.

The President appoints the Secretary of State for the Armed Forces, who in turn appoints three Deputy Secretaries of State for the Army, Navy and Air Force with the President's approval. The Secretary of State, usually an army major-general, and his three deputies are all military personnel, and within the chain of command. These officers are primarily responsible for policy-making and supervision; operational control of the forces is in the hands of the three Chiefs of Staff — an army major-general, an air force brigadier-general and a navy commodore — while day-to-day administration is done by their respective General Staffs.

In 1977 the Secretary of State for the Armed Forces was Major-General Juan René Beauchamps Janvier, and the Secretary of State for the Interior and Police was Major-General Enrique Pérez y Pérez. The army Chief of Staff was General Orlando Álvarez Sánchez, the navy equivalent was Commodore Francisco Rivera Caminero, and the air force Chief of Staff was Colonel Renato Malagón Montesano.

The National Police, a paramilitary force, are under the control of the Secretary of State for Interior and the Police, a Presidential appointee. The Director-General is an army officer, but is subordinate to the Secretary of State.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

The Dominican army's principal roles are national defence and the maintenance of internal security, including defence against guerrilla landings or attacks. Despite the overwhelming superiority of the Dominican armed forces, which outnumber the Haitian forces almost three to one and are far better equipped, the lengthy and brutal Haitian occupation of the country is still remembered and resented, and defence against Haiti is seen as a real priority. Even in recent decades there have been recurrent war scares, usually because of each government's habit of intriguing against the other or due to the continuing pressure of illegal immigration from overcrowded and far poorer Haiti into the Dominican Republic.

The last actual clashes were in 1937, when Trujillo's forces massacred at least 10,000 seasonally immigrant Haitian cane-cutters and the two countries went to the brink of full-scale war. Trujillo habitually intrigued for the overthrow of Haitian governments which were not subservient to him, and repeated the practice in the first years after Dr Duvalier established his comparably totalitarian regime in the neighbouring republic, but external pressures against both dictators soon forced them to sign a secret mutual assistance pact in 1958.

Duvalier was deeply alarmed by the subsequent assassination of Trujillo in 1961 and the rise to power of the democratic leftist Juan Bosch, and commenced to plot Bosch's overthrow. Bosch brought charges before the OAS and moved troops to the border in 1963, whereupon Haiti severed diplomatic relations. The crisis escalated to the point where Bosch was threatening to recognise a Haitian government-in-exile and Venezuela offered him military assistance. The Triumvirate which deposed Bosch was unable to restore diplomatic relations with Haiti, and in 1964 the Dominican army was mobilised. Since the end of the civil war and the accession of Joaquín Balaguer to the Presidency in 1966, however, relations between the two countries have improved considerably, and in 1972 after the elder Duvalier's death, his son even entered into an agreement with the Dominican Republic to expand trade between them.

Nevertheless, historical anxieties and the ever-present danger of a confrontation over the Dominican Republic's attempts to control illegal Haitian immigration mean that the 193 mile border with Haiti and the narrow valleys leading eastwards from it are still primary security concerns for the Dominican armed forces. The border, closed for much of the two countries' independent history, has been open again in recent years, though only where the main road between the two capitals crosses it, but even this link has been allowed to fall into an almost impassable state of disrepair. In any conceivable military confrontation between the Dominican Republic and Haiti the Dominican regular forces would enjoy an

World Armies

overwhelming superiority, but Santo Domingo is fully conscious of the old Haitian tradition of raising huge amateur armies at short notice, and of the fact that the Haitian side of the border is far more densely populated than the Dominican.

The Dominican Republic's other international relations have predominantly been with the USA, although in Trujillo's last years he was engaged in several feuds with other Latin American presidents (his attempt to arrange the assassination of Venezuelan President Romulo Betancourt in 1960, which resulted in the wounding of the latter, brought on the OAS economic and political sanctions which hastened his own overthrow in 1961). Subsequent Dominican governments have been little involved in hemispheric politics, and the country at present has no defence commitments beyond its border. It belongs to the OAS and the UN.

In its other main role, that of maintaining internal security, the Dominican army acts in close co-operation with the National Police, a paramilitary force of 10,000 men whose Director-General is an army general. Suppression of urban riots and rural disorders of a political nature is generally left to the police, with the army held in reserve.

Guerrilla movements have not presented major problems despite the proximity of Cuba, and the Dominican armed forces are now extremely well trained and equipped to deal with any such outbreaks. (They include a battalion whose training has been along the same lines as the United States' 'Green Berets'.) Two small guerrilla landings on the coast in the first years of Castro's regime in Cuba were easily wiped out, and a prolonged campaign of right-wing terror and assassination in 1966-71, perpetrated by an unofficial group known as 'La Banda' within the National Police, killed or drove into exile most of the prominent left-wing political activists in the country.

The ultra-right- and left-wing leaders of the 1965 civil war both subsequently tried and failed to overthrow President Balaguer's government, and are no longer a threat. General Wessin was caught in the midst of a conspiracy in 1971, and was shown on television while a premature recording of his voice announcing the fall of the government was played, before being handed over to the armed forces commanders, who sent him into exile in Spain. The left-wing leader, Colonel Caamaño Deñó, who had disappeared from his post as military attaché in London in 1966, made a quixotic attempt to overthrow Balaguer by landing on the south coast in February, 1973 with a handful of supporters, but they were hunted down and killed in 10 days. Another landing by Dominican emigrés in June, 1975 was equally unsuccessful. At the moment, especially in view of the fact that Cuba has ceased to support Latin American guerrilla adventures in recent years, the likelihood of a major outbreak of guerrilla warfare in the Dominican Republic seems small.

All branches of the armed forces participate in civic action programmes, principally in rural areas. The army has a special responsibility for forest conservation and re-forestation, and the Directorate General of Forestry has been removed from the jurisdiction of the Secretary of State for Agriculture and placed under the Secretary of State for the Armed Forces.

The principal combat units of the Dominican army are three infantry brigades, one of which is based in the Santo Domingo area while the other two are distributed around the three military sectors (northern, southern and western) into which the country is divided. In the interior, army forces are divided into small units which are stationed in each town and village, some detachments being merely a corporal and a squad of eight men. Naval forces are distributed around the coast, with the principal base in Santo Domingo, while almost all air force units are based at San Isidro airfield outside the capital.

The operations section of the National Police, which bears primary responsibility for the preservation of public order, is divided into four regional commands, with headquarters at Santo Domingo, San Pedro de Macorís, Santiago de los Caballeros and Barahona.

The only recent major military operation undertaken by the Dominican armed forces was the civil war of 1965, which was not a fair test of their operational capabilities since they were fighting themselves.

ORGANISATION

Arms of Service

The Dominican army consists of infantry, artillery, anti-aircraft and armoured units. Support troops are organised into engineer, signal, transportation, medical and quartermaster units.

The air force is organised into four commands, all of which are based at San Isidro. They are Air Command, controlling all flight operations; Maintenance Command; Combat Support Command, which is responsible for all base services; and Base Defence Command, responsible for security and including infantry and paratroop units.

The General Staffs for all three armed forces are divided into the same five sections: personnel, intelligence, operations, logistics and public relations. Each service also has an administrative judge advocate section.

The National Police is run by a Director-General who is an army general officer. He has three Assistant Director-Generals, heading the three main sections of the National Police: administration and support, police operations and special operations (the secret police).

Operational

The army's main strength is three 'brigades': regimental organisations containing from three to five battalions plus support units. Its other units are one mixed armoured battalion, one mountain infantry battalion, one paratroop 'battalion'

(company strength), one Presidential Guard battalion, one artillery regiment, one anti-aircraft artillery regiment, one engineer battalion and one armoured reconnaissance squadron.

The air force is divided into two operational squadrons, one of fighter-bombers, the other a COIN/training unit. There is also a transport squadron, a helicopter squadron and a training wing. Air force headquarters is at San Isidro; other air bases are at Santo Domingo, Puerto Plata, Santiago, La Romana, Saibo, Barahona, La Vega, Monte Cristi and Azua.

The navy is divided for administrative purposes into three zones: Santo Domingo (where naval headquarters are also located), Puerto Plata in the north and Barahona in the south. The main naval bases are at Las Calderas and San Pedro de Macoris. Besides its maritime forces, the navy also maintains a commando battalion.

RECRUITMENT, TRAINING AND RESERVES

The 1966 Constitution authorises conscription for males between eighteen and fifty-four, but in fact all vacancies in the Dominican forces are easily filled by voluntary enlistment. Military service tends to be a long-term career and even enlisted men often stay on until retirement age.

Army enlisted men receive basic training at a centre near Santo Domingo, navy personnel at Las Calderas, 50 miles west of the capital, and air force recruits at San Isidro air force base. Subsequent training is conducted within army and air force units and aboard naval vessels; at Baní in Peravia province is the Vocational School of the Armed Forces and National Police, where members of all branches who are about to return to civilian life receive training in various semi-skilled trades.

Officer candidates must possess a high school diploma and pass strict physical examinations. Each of the three services maintains a military academy which graduates about 50 students a year after a 4 year course. Air force cadets attend the army academy at Haina for the first 2 years before going on to the air force school for special training; the naval academy runs its own full 4 year course.

Infantry officers of captain and lieutenant rank attend a 6 month basic course before being appointed to company commands. The army also conducts a 10 month command and staff course for officers between captain and lieutenant-colonel rank to prepare them for battalion command. More advanced officer training for all three services is done at United States military education facilities in the Panama Canal Zone and in the USA itself, under the terms of the Military Assistance Agreement of 1962.

Following the 1965 civil war a National Police Academy was established with assistance from the USA. National Police students also attend advanced courses in the Panama Canal Zone and at the International Police Academy in Washington, D.C.

Pay and conditions of service are more generous than those prevailing in comparable occupations in civilian life, and service personnel benefit from medical services and special shopping facilities. All members of the armed forces who have served honourably are entitled to pensions of 75% of their highest pay after 30 years of service (twenty for some special categories like flying personnel). Compulsory retirement age is fifty for enlisted personnel, rising to sixty for colonels and lieutenant-colonels, and seventy for general officers.

There is a law which requires all those not enlisted in the regular forces to do 2 months/year of service in the reserves, but it is not widely applied. The size and state of preparedness of the reserve organisation is not known.

EQUIPMENT AND ARMS INDUSTRY

The army is equipped with standard United States infantry weapons — United States military assistance between 1946 and 1971 totalled \$28,300,000 — but it has a somewhat more varied stock of heavier weapons. It has 20 AMX-13 light tanks, and 20 Lynx and some AML armoured cars, plus a considerable number of APCs. The artillery is furnished with 75 mm, 105 mm and 122 mm howitzers, and air defence depends on 40 mm anti-aircraft guns.

The navy possesses three frigates (one of which doubles as the presidential yacht and midshipman training vessel), two ocean corvettes and two fleet mine-sweepers. All are somewhat aged vessels passed on from the United States and Canadian navies. Smaller vessels include 14 patrol craft (12 under 100 tons), one landing ship (medium), two landing craft, six coastguard vessels, two oilers, two survey craft and eight tugs.

The air force has 43 combat aircraft, mostly of World War II types. The bomber squadron has seven B-26 bombers, the fighter squadron has 10 Vampires, and the fighter-training squadron has 20 F510 Mustangs. The COIN/training squadron has six much newer armed T-28Ds. There are also two PBT-5 Catalina maritime reconnaissance flying-boats; six C-46, six C-47 and three DHC Beaver transports; four T-6, some T-11, two T-33 and four Cessna 172 trainers; and two UH-12, seven OH-6A, two UH-19 and three Alouette II/III helicopters.

The Dominican Republic produces small arms and ammunition, uniforms and most smaller items of personal equipment itself, and the arsenal at San Cristóbal, 15 miles west of the capital, is capable of producing machine-guns, mortars, anti-tank guns and munitions, as well as rebuilding heavier weapons. All major weapons such as ships, tanks, aircraft and artillery must be acquired abroad, however.

World Armies

RANK, DRESS AND DISTINCTIONS

Dominican officer ranks are the same as those in the United States armed forces, although there are not normally any officers above major-general/rear-admiral rank. The rank structure is very inflated, with 41 generals and admirals for only 18,500 men. Army and air force company-grade officers wear one, two or three silver laurel leaves on shoulder-boards; field-grade officers wear a metallic replica of the national coat of arms surmounted by one, two or three silver laurel leaves; brigadier and major-generals wear the coat of arms with one or two silver stars. Navy rank insignia are similar to those of the USA up to captain rank, but commodores and rear-admirals wear the same insignia as army and air force generals on gold shoulder-boards. Enlisted personnel of all services wear a series of olive-green chevrons on the upper sleeve.

The uniforms of the Dominican armed forces closely resemble those of the corresponding services in the USA. Naval officers have white, tan and blue uniforms; army and air force officers both wear tan fatigue uniforms in the field, but the garrison uniform of the air force is light blue rather than tan. Each branch of the armed forces has a distinctive uniform for formal and dress occasions.

The highest Dominican awards are the Order of Merit Duarte, Sánchez and Mella; the Order of Christopher Columbus; and the Captain General Santana Military Order. These are followed by the orders of army, navy, air force and police merit. The highest two awards are also granted to civilians and foreigners for distinguished service to the Dominican Republic; the remaining five are reserved for military personnel.

CURRENT DEVELOPMENTS

In the May, 1978 elections President Balaguer, having ruled for 12 years, was defeated by the candidate of the PRD, Antonio Guzman. There was almost a military coup during the counting of the ballots, when National Police units (which are under the authority of the armed forces) intervened at the central electoral headquarters in Santo Domingo, ejected the election officials and stopped the count. It was evident that this move did not have the united support of the armed forces high command, however, despite their anxiety about a victory for the party on whose behalf the rebels had acted during the 1965 civil war.

After a day of confusion, Balaguer asserted his authority over the armed forces, who withdrew the units from the electoral headquarters and allowed Guzman's victory to be verified. While there was undoubtedly strong pressure from the USA and the Organization of American States (which had an electoral observer team present) to prevent the setting aside of the election results, the credit for the obedience shown by the armed forces must ultimately go to Balaguer, who had pursued the goal of gradually reducing the armed forces to their constitutionally ordained subordination to the civil power through the whole period of his Presidency. He proved himself a master at playing off the competing factions in the armed forces against each other in order to accomplish this aim.

Until about 1970 Balaguer was not in full control of the armed forces and the National Police, elements of which were involved in a secret terrorist campaign that murdered hundreds of PRD and other left-wing leading figures. In July, 1971 however, the influential right-wing leader in the civil war, General Wessin, was caught red-handed while attempting to mount a coup, and was sent into exile with the concurrence of the armed forces chiefs. In October, 1971 Balaguer replaced General Enrique Pérez y Pérez as Commander of the National Police by his own long-standing associate, General Neit Nivar Seijas, with instructions to end the violence. By the end of the year La Banda had been disbanded, and the official terror campaign had died away.

The popularity Nivar Seijas gained in this operation, and the sheer fact that he had done it, aroused much resentment amongst the leading ultra-right-wing officers of the armed forces. They succeeded in having him kicked upstairs as Secretary to the Presidency in 1972, while General Pérez y Pérez was made Army Commander. Political terrorism began to rise again in the country, and in 1973 Juan Bosch resigned as leader of the PRD, leaving the left hopelessly divided and leaderless.

After Balaguer won his third term of office in 1974, however, he felt strong enough to challenge the dominant ultra-right groups in the armed forces hierarchy by reappointing Major-General Nivar Seijas as National Police Commander. As soon as he did this in May, 1975 the Army Chief of Staff, General Pérez, resigned together with his associates the Secretary of State for the Armed Forces, and the Air Force and Navy Chiefs of Staff. Balaguer simply accepted their resignations, briefly took over the armed forces department himself, and then appointed new men. As a consolation prize, however, General Pérez was subsequently appointed as Secretary of State for the Interior and the National Police.

The most dangerous phase of the process, that of gradually reducing the armed forces' share of government expenditure, was already safely past in 1978. The failure of the half-hearted military intervention in the 1978 elections would seem to confirm the new subordinate status of the armed forces, at least so long as an adroit manipulator of the deep factional divisions in the officer corps occupies the presidential office.

There is no serious revolutionary organisation in the Dominican Republic at the moment — the communists are split into four small, squabbling fragments — but the present conditions could well be conducive to the rise of one. The Republic, which enjoyed an extremely high economic growth rate in 1970–75 (over 10% a year) due to the boom in sugar prices, has been hit harder than any other country in the world by their collapse in 1976: sugar contributes one-fifth of

GNP, and two-thirds of export revenues. Average per capita income is close to \$1000 a year, a respectable figure for Latin America, but it is grossly maldistributed: even in the boom years unemployment and under-employment were estimated at 40% of the adult population, and over half the population are undernourished.

The government has great difficulties in doing much about this. Haitian cane-cutters have been banned (which could cause trouble), and the redistribution of State lands has been accelerated, but there would be strong resistance from land-owners and army officers to a more radical land reform programme designed to relieve rural poverty. Most of the Dominican population is still rural, two-thirds of it living in the fertile plains of the north-east around Santiago, but the capital of Santo Domingo across the mountains on the south coast has tripled in size since 1960, and now numbers over 1,000,000 people. Vast slums now ring it to the north, and even less is being done about the misery of their inhabitants.

While such conditions may be breeding grounds for radical popular movements, however, there is some prospect that the new government may be able to tackle social problems in a more decisive manner. At the same time, the PRD of 1978 is a moderate centre-left party, long shorn of the radical elements that were present in it in the mid-1960s. The newly elected President, Antonio Guzman, is of a background — businessman and cattle-rancher — which is unlikely to alarm the more extreme right-wing elements in the armed forces sufficiently to unite them in a coup against him. His first step was to dismiss Balaguer's closest military associates, Secretary of State for the Armed Forces Lieutenant-General Juan René Beauchamp and the commander of the Santo Domingo garrison, General Neit Nivar Seijas. Provided he shows the same skill as Balaguer in the management of military factional rivalries, the new status of the Dominican armed forces is likely to continue.

GWYNNE DYER

ECUADOR

HISTORY AND INTRODUCTION

Ecuador is at present under a military government, which took power in 1972. That turn of events cannot be said, however, to mark an unnatural interruption in the course of Ecuadorian politics which, to a degree unusual even in Latin America, are an arena of abrupt and unconstitutional changes of regime. Between 1925 and 1962 there were 29 changes of president, only two of whom held office for their full term. Most of these changes, moreover, were brought about by political rather than military means and, though military intervention in politics is not unusual, the turbulence of Ecuadorian political life does not stem from military caprice. It depends rather upon intense personal rivalries for the support of a very narrowly drawn electorate. The current military regime promises to broaden the electoral base and, in its economic policy, has also given evidence of a radical and nationalist inclination. There is a precedent for its behaviour in the declarations of the officers who made the coup of 1925, which was avowedly left wing in intentions. The current regime is certainly not left wing, and has made its hostility to the left-wing parties clear, but seems determined to break the power of the old oligarchy and to win for Ecuador a fair share of the revenue from her natural resources, hitherto exploited by foreign-based companies.

Ecuador, originally a part of Gran Colombia, became independent of that successor State in 1830 and for 15 years was ruled by a lieutenant of Bolívar, General Flores. On the overthrow of his personal rule there followed 15 years of turbulent rule by anti-clerical liberal politicians, until in 1860, with the military assistance of Flores, a remarkable conservative and Catholic politician, García Moreno, inherited the presidency. During his 15 years of power, Ecuador was transformed into a theocracy, in which the church was elevated to the highest place of honour, the country dedicated to the Sacred Heart of Jesus and the army's regiments given such names as Soldiers of the Infant Jesus, Volunteers of the Cross and Guardians of the Virgin. But the army was also reorganised and put on a modern footing, as were the other institutions of the State. Moreno, though a fanatic, was a highly efficient one to whom Ecuador owes its emergence as a modern State. His fall ushered in 20 years of chaos and civil war, and then an era of liberal presidencies (1897–1916), which unmade his theocratic structures. Politics remained, however, the concern of the urban and propertied minority, and the majority of illiterate and landless Indians had no say in its workings. The first genuine liberalisation of the system was brought about by a military coup in 1925, the work of a military 'lodge', the *Liga Militar*, formed by officers from the inland sierra, who sponsored a left-wing government. Their success blunted their left-wing impulses, however, and they quickly became servants of the traditional oligarchy, which continued to monopolise power through a 'waltz of the presidents' until 1944. The army then again intervened to place in the presidential palace the politician who has dominated Ecuadorian politics almost ever since, José Velasco Ibarra. Political life since his arrival may be said to have taken the form of a dialectic between him and the leaders of the armed forces, in which they and he alternately champion opposed political positions. Standing for no fixed position except opposition to the traditional ruling class, his policies have 'smacked at different times of conservatism, liberalism, *justicialismo* (Peronism) and moderate reformism'. But the army, too (and the air force, which has a 'progressive' reputation), has espoused a variety of positions during the same period. Thus it turned Velasco out in 1947 when his demagoguery took one of its rightist turns, and installed a *junta* in 1963–6 which promised an expropriatory land reform, but removed Velasco in 1972 largely for fear of his threat to sponsor candidates from the left-wing alliance *Concentración de Fuerzas Populares* in the forthcoming elections, his breach with the United States over fishing rights and his meetings with Castro and Allende of Chile. The military regime which has held power since is sternly right wing, but has also shown itself ready to quarrel with the United States and to prepare with apparent sincerity for an extension of the franchise and of the representative character of congress.

The erratic and at times unconfident political behaviour of the Ecuadorian army may stem in part from its compromised role as defender of the national territory. In 1904 the country was obliged under pressure to surrender a large slice of Amazonian territory in the Oriente to Brazil, and in 1941 the army fought and lost a war with Peru in the same area. The country was obliged to concede Peru's annexation of more Amazonian territory by the Protocol of Rio in the following year. There have again been border clashes in the area in the last 2 years.

STRENGTH AND BUDGET

Population: 7,680,000

Army: 17,500

Navy: 3800 (including 700 marines); three major vessels, 15 smaller

Air force: 2600; 48 combat aircraft

GNP (1976 estimate): \$4,700,000,000

Defence expenditure (1977): \$114,000,000

The Constitution of 1946 lays down that defence, with education, shall receive preferential consideration in the apportioning of the budget, and the Ecuadorian armed forces are traditionally accustomed to receive a remarkably large share — about 25% in the 1940s and 1950s. As late as 1968 they received 19.5%, the bulk of which went to the army. The army has also benefited generously from American military assistance.

COMMAND AND CONSTITUTIONAL STATUS

The Constitution of 1946, in force before the military seizure of power in 1972 (when it was replaced by the Constitution of 1945), invested command in the President, who was advised by a National Security Council and the Joint Chiefs of Staff of the Armed Forces. The forces were under the administrative control of the Minister of Defence, to whom the commanders of the three services answered through the Chief of Staff of the Armed Forces. The Constitution defined the armed forces as 'non-deliberative', meaning that they were not to take any share in State policy-making, though a member of the armed forces sat *ex officio* as their representative in the senate. Congress was to fix annually the size of the armed forces, and to approve all promotions to the rank of colonel and above by secret ballot. Defence expenditure was, with education, to receive preferential treatment in apportioning the budget.

The military regime which took power in 1972, though nominally bound by the provisions of the Constitution of 1945 (the fifteenth to be introduced since 1830), is in practice in the process of defining a new political system. The country is ruled by a *junta* of the heads of the armed services following the deposition of the military Head of State, President Lara, in January, 1976. All political activity is suspended, but three committees, charged respectively with revising the 1945 Constitution, drafting a new one to replace it and drawing up a new electoral and party law, are sitting. The first two have reported, and recommend an extension of the franchise to illiterates, a single chamber congress and the sponsoring of all presidential candidates by an established political party. The committee producing a new electoral law has not yet reported; the drawing up of new electoral registers, begun in 1976, has suffered delay; and the elections promised for January, 1978 were, in April, 1977, postponed. The government therefore continues to rule by decree, through a cabinet which is largely military in composition.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Article 153 of the 1946 Constitution (revoked by the military regime in 1972 and replaced by the 1945 Constitution) prescribes that 'for the defence of the Republic and the maintenance of constitutional order there shall be a military armed force in accordance with law'.

Ecuador has no external military commitments; the country is a signatory of the Chapultepec and Rio Pacts; it has a military assistance agreement with the United States. The national territory is divided into six military zones, with headquarters at Quito (capital), Guayaquil, Cuenca, Machala and Loja; the sixth zone comprises the Oriente region on the Amazon headwaters. The two motorised battalions of the army are stationed at Quito and Guayaquil. The nine infantry battalions and 10 independent companies are stationed in the 19 provinces, according to population. There is a small unit on the Galápagos. There is a Presidential Guard squadron at Quito and a horsed cavalry squadron in the headquarters town of the other military regions. The parachute and air-defence battalions are stationed at Quito; the parachute battalion has an alternative base at Salinas, on the coast. The three armoured squadrons are probably stationed at the capital, together with the three artillery 'groups' (? batteries) and the two engineer battalions (though they may be in the interior).

Border clashes between Ecuadorian and Peruvian troops were reported between June, 1976 and January, 1977 on the disputed frontier in the Oriente, but are said to have been ceased by agreement. Peru and Ecuador fought a war over the border in 1941 and Ecuador was brought to accept a frontier adjustment in Peru's favour by the Treaty of Rio in 1942.

ORGANISATION

The army is organised into the following branches: infantry, cavalry, artillery, engineers, signals, transportation, material, intendance, medical and veterinary. Operationally, the highest level of organisation is the battalion. The concentrations of troops at Quito and Guayaquil are of brigade group size.

The National Civil Police is a centralised force with a 'corps' in each province. Those in Quito and Guayaquil are about 700 strong. The country is divided into four police districts, controlled by the Ministry of Government.

World Armies

RECRUITMENT, TRAINING AND RESERVES

Recruitment and Training

Universal conscription is decreed by law, but recruitment is in practice selective. Few Indians are conscripted. The size of the annual available contingent is about 45,000 of which one-fifth is inducted. The choice is made by selective service boards in each provincial capital. Only-sons, students and principal breadwinners are exempted. Recruits are enlisted at twenty for 2 years' service. They are trained in the units, which are more than training organisations.

Officers are recruited by competitive examination from high-school students and trained in the *Colegio Militar* at Quito; the course lasts 5 years, and is a mixture of military and academic instruction; about 60 army and air force cadets graduate annually. There is an arms school (*Escuela de Perfeccionamiento*) at Quito, which trains officers in the specialisms of their own arms, and runs courses for other ranks of the cavalry, artillery, infantry, engineers and signals. Staff training is conducted at the *Colegio de Guerra*, Quito; the course lasts 2 years. In 1972 the military government founded a tri-service school, modelled on the Peruvian CAEM, called the Institute for Higher National Studies. The main influence on Ecuadorian military education has been Chilean. A Chilean military mission, bringing newly learnt German methods, came to the country in 1900. It continued to be responsible for most of their training at the Staff College until 1962. The Staff College itself was founded in 1922 by an Italian military mission, which also set up the Arms School at Quito.

Two specialist schools of importance are the parachute school at Salinas, on the coast, and the jungle-warfare training school (special forces school) in the Oriente region. Another is the School for Industrial Apprenticeships (*Centro Militar de Aprendizaje Industrial*), Latacunga, Cotopaxi province, founded in 1962, which trains conscripts who volunteer for an additional year's service in automotive engineering and electronics.

Reserves

Time-expired conscripts form a reserve, the size of which is undisclosed, but is probably about 50,000. In May, 1972 some reservists were called up to take part in manoeuvres held in the San Antonio training area.

EQUIPMENT AND ARMS INDUSTRY

Ecuador has no arms industry, and does not appear to manufacture even small-arms ammunition. Most of the army's equipment is American, some of it obsolete, though in recent years some items have been purchased from France. For its size, it is among the better-equipped Latin American armies.

Rifle: 7.62 mm FN (Belgium)

Machine-gun: 7.62 mm FN (Belgium)

Air-defence weapons: 40 mm L60/70 Bofors (Sweden; USA)

Artillery: 105 mm M-101 howitzer (USA) and 155 mm M-44 self-propelled howitzer (USA; six in service)

Armour: AML 60/90 armoured car (France; 27 in service); AMX-VCI APC (France) and M-113 APC (USA); M-3 half track (USA; 15 in service); M-41 light tank (USA; 25 in service) and AMX-13 light tank (France; 41 in service)

The army operates 16 light aircraft and two helicopters. The air force operates 18 military transports and 18 helicopters.

RANK, DRESS AND DISTINCTIONS

General de Ejército	Two gold stars, national crest
General de División	One gold star, national crest
Coronel	Three gold stars
Teniente Coronel	Two gold stars
Mayor	One gold star
Capitán	Three silver stars
Teniente	Two silver stars
Subteniente	One silver star

The service dress of the army is grey. Combat dress is American in colour and style. Officers wear a full dress of purple tunic and black trousers. There is a War Cross, instituted after the war of 1941 with Peru.

CURRENT DEVELOPMENTS

The military government which took power on February 15th, 1972, headed by General Lara, the army commander,

issued a 13-point 'Philosophy and Plan of Action of the Armed Forces' which declared the regime to be 'nationalist, military and revolutionary', and to have as its aims 'social justice, redemption of the humble, and transformation of the country's basic structures in order to benefit the country's less-favoured social strata'. The main ways in which this programme could be brought about are through land reform in the sierra, where most of the Indians work on the property of large estate-owners, and by taking a larger share in the revenues of the foreign-owned extractive industries. The government has not (unlike the *junta* of 1962-6) made any move towards land reform, but it has encroached sharply on the interests of the foreign oil companies. In June, 1974 it took a 25% interest in the holdings of the Gulf-Texaco consortium, and in January, 1977 nationalised the Gulf holdings in the country. It has also given strong evidence of its wish to establish civilian democratic government in the country on a new and more stable basis. Since February, 1977 three committees have been sitting to draft a new constitution and prepare new electoral and party laws. Elections were promised in 1977 for 1978 and have been postponed only, by the government's account, because of delays in preparing new electoral rolls.

On the other hand, there is also evidence that it is less committed to change than its words promise. In October, 1974 the Minister of Natural Resources, Captain Ampudia, was removed from office because of his 'strongly nationalistic oil policy'. In January, 1976 President Lara was overthrown in an internal coup after announcing plans for a speedy return to civilian rule, and in the following June, Colonel Levoyer, the Minister of the Interior, was removed from office by the new *junta* after announcing a return to civilian rule by January, 1978. The *junta* has also dealt harshly with internal disorder. In July, 1977 the heads of two of the major trade union organisations were imprisoned for leading strikes and in October a strike of sugar-cane workers was put down with over a hundred deaths.

There have been two military uprisings since the coup of 1972, one against Lara in September, 1975 which was put down with little bloodshed, and another, apparently opportunist, at the time of Lara's deposition in January, 1976. Lara was also obliged to replace the commanders of the navy and the air force in February, 1972 when they resigned in protest at the 'predominating influence' of the army over the new military government. It is therefore difficult to define the character and inclination of the military government. The present *junta* is probably, as its political and trade union opponents accuse, right wing and fearful of change, but it cannot be said that that attitude characterises the outlook of the officer corps as a whole. The reality seems to be that the armed forces are as fragmented politically as is the Ecuadorian 'political nation', and as much the plaything of *personalismo* as the electorate and the congress in the days of civilian government.

JOHN KEEGAN

EGYPT

HISTORY AND INTRODUCTION

Despite an ancient tradition of almost two millennia as a great military power under the Pharaohs, Egypt virtually lost its military significance before the beginning of the Christian era. Successively conquered and ruled by Persians, Greeks, Romans, Arabs, Turks, French and British, the Egyptian population ceased to be regarded, or to regard itself, as a militarily competent people. There was a brief renaissance of Egyptian military power in the early nineteenth century under the rule of Muhammad Ali, an Albanian adventurer nominally in the Ottoman service, and Egyptian armies fought well in the Greek War of Independence and the Syrian wars of that period, but this premature effort to create a modern Egyptian army lapsed after the deaths of Muhammad Ali and his son Ibrahim in mid-century.

When British power first began to establish itself in Egypt later in the century, it was opposed by an uprising led by Lieutenant-Colonel Ahmad Arabi in 1882. British troops put down the revolt, and the army created by Muhammad Ali was disbanded. In its place, a new colonial-style Egyptian army was created by the British, commanded and largely staffed by British officers. The Egyptian officers serving under them were almost invariably chosen from wealthy families of high social standing, while the enlisted men serving in the army were members of the poorest classes who were unable to pay the exemption fee by which military service could be avoided. This army fought indifferently in the Sudan and other nearby countries for the British, but regular British regiments were maintained in the country for the defence of the vital Suez Canal installations.

Egypt never formally lost its independence during the period of British rule, and in 1918 the Egyptian government took advantage of the stresses placed upon Britain by World War I to demand successfully that the command and staff posts within the army be handed over to Egyptian officers. There remained a British inspector-general in a supervisory position, but his post was abolished by the Anglo-Egyptian treaty of 1936, which also provided for the withdrawal of some British garrison troops. Up to this time the Egyptian army still remained a body incapable of acting as a national mobilising force because of the ultra-conservative views of its wealthy officer corps and the immense social gulf between officers and men, but another development of the same year was to alter this situation fundamentally. It was in 1936 that the rules for admission to the Egyptian Military Academy were changed to allow the sons of middle-class families to enter.

The graduates of the Military Academy classes of 1938, 1939 and 1940 were a different breed: nationalists, anti-monarchists, and, from the start, revolutionaries. During the campaigns in the Libyan desert in 1940-43 many of them were involved in intrigues with the Axis forces across the frontier aimed at expelling the British from Egypt, and many ended up in jail as a result. They all fought in the unsuccessful war against newborn Israel from May 1948 to February 1949, and it was their anger at the corruption and ineptness of the monarchy, which they held responsible for that defeat, which caused them to form the secret Free Officers' Movement in 1949.

In July, 1952 they seized power, forcing King Farouk to abdicate; Egypt became a republic in the following June, with General Muhammad Neguib as President and Prime Minister. He was of an older and more conservative generation, however, and it was Colonel Gamal Abdul Nasser, the Deputy Prime Minister, who became acting Head of State when the younger Free Officers ousted Neguib in November, 1954. A new constitution was introduced in 1956, and Nasser was elected President.

It would be a great exaggeration to state that Egypt has been ruled from 1952 to the present by the 1938, 1939 and 1940 graduating classes of the Egyptian Military Academy. Nasser belonged to this group, however, as does his successor Anwar Sadat, and what even today remains a high proportion of the most senior Egyptian officers. They were colleagues in nationalist conspiracy from 1940 onwards, and in government from 1952; despite many later splits and intrigues, they remain a group with a distinctive identity. It was from their early ideals that 'Nasserist' rule took its character: barely disguised permanent military rule (but with the army in the background), activist, anti-imperialist, anti-Israel, and devoted to a nebulous and authoritarian concept of socialism and social change. Despite the official pan-Arabism which was enthusiastically purveyed so long as Nasser lived, the majority of this leadership generation were deeply nationalistic men in a more narrow Egyptian context, and saw pan-Arabism principally as a vehicle for restoring Egypt to great-power status. There have been great changes of emphasis in Egyptian domestic and foreign policy since Nasser's death, particularly as regards socialism, 'anti-imperialism' and policy towards Israel, but many of the characteristic priorities and attitudes of the earlier period remain. There also remains a segment of the officer corps, of unknown size, which secretly preserves the 'Nasserist' ideology in its original form.

Nasser nationalised the Suez Canal in July, 1956 largely in an effort to obtain revenue to finance the building of the Aswan dam. His seizure of the Canal was opposed by the British and French governments, and in the late October and early November of 1956 British and French forces attacked targets in the Nile Delta while the Israelis advanced through the Mitla pass into Sinai. Although international pressure brought about a rapid ceasefire and allied withdrawal, the episode served to

push Egypt further into the arms of the communist bloc, from which she had already begun receiving large quantities of arms in the previous year.

In February, 1958 Egypt and Syria formed the United Arab Republic, but Syria withdrew from the union following a change of regime in September, 1961. Egypt continued to strengthen her ties with the Soviet Union: Khrushchev visited Egypt in May, 1964; he was followed by Kosygin in August, 1965 and May, 1966. Nasser, meanwhile, stepped up his propaganda against not only Israel but also the 'imperialists' and their allies in the Arab world. Between 1962 and 1967 he gave substantial military assistance to the republican forces in the civil war in the Yemen: at one time about one-third of the Egyptian army was deployed there. The fighting in the Yemen was, however, overshadowed by the Six-Day War of June, 1967 in which Egypt and her allies suffered a severe defeat at the hands of the Israelis. Egyptian forces were driven across the Suez Canal, and their losses in manpower and equipment were very heavy. Israeli forces remained in occupation of the entire Sinai peninsula.

Russia immediately came to Egypt's aid with plentiful arms supplies; the losses of the war were made good, and a sophisticated air-defence system was installed along the Suez Canal. There were 2500 Soviet advisers in Egypt by the end of October, 1967 and this figure rose to 15,000 by mid-1970. Numerous clashes between Egyptian and Israeli ground and air forces occurred during this period, and a small number of Soviet pilots were shot down. A ceasefire came into effect on August 1st, 1970, under the terms of which both sides agreed upon a military standstill for 32 miles on each side of the Canal. This agreement was not fully honoured by Egypt, and SA-2 and SA-3 missiles were subsequently deployed in sites near the canal.

There was considerable unrest within the army following the 1967 defeat, but a planned military coup was nipped in the bud. Nasser died in September, 1970 and was succeeded as President by Colonel Anwar Sadat, who initially continued his predecessor's policy of friendship towards Russia. Relations between the Soviet Union and the Arab world deteriorated steadily, however, and in July, 1972 Sadat ordered most of his Russian advisers to leave. He also attempted to strengthen the ties between Egypt and her allies: a federation of Libya, Syria and the Arab Republic of Egypt came into force in February, 1972 but had little real effect. In 1972-3 a gradual union of Egypt and Libya was agreed upon, but once again the measure had few practical consequences.

Sadat's unsatisfactory relations with the Soviet Union convinced him that Russia did not seek another war in the Middle East; American support for Israel seemed, moreover, likely to continue. He therefore planned a limited military offensive which would provoke an international crisis, as a result of which the superpowers might compel Israel to make concessions. The planning for Operation *Badr* began in October, 1972 when General Ahmed Ismail was appointed Minister of War, with General Saadeddin al-Shazli as his Chief of Staff. Ismail was appointed Commander-in-Chief of the federated forces of Egypt and Syria in January, 1973 and expanded his existing plan to permit operations on two fronts. Detailed planning went on, in the utmost secrecy, from February, 1973 and was assisted by close co-operation between Ismail and his Syrian opposite number, Major-General Mustafa Tlas.

Intensive training was accompanied by an elaborate deception plan: the latter was so effective that the Americans knew of the imminent offensive only hours before it commenced. The Egyptian attack was launched on October 6th, when the Israelis were celebrating Yom Kippur, the Day of Atonement. The Suez Canal was crossed in strength and the Israeli Bar-Lev defence line invested, while on the Syrian front five divisions advanced into the Golan. It took some time for the superpowers to react, but on October 10th Russia began a massive airlift of arms to Egypt and Syria, and the USA commenced a similar airlift to Israel 4 days later. The Israeli counter-offensive, which met with considerable success on the Syrian front and made more limited gains on the Egyptian front, helped convince Kosygin of the necessity of a ceasefire, but it was not until October 22nd that he was able to persuade Sadat to agree to a compromise formula. This agreement did not bring about an immediate cessation of hostilities, and it was only after President Nixon had brought American forces to nuclear alert that Russia agreed to the establishment of a UN force to supervise the ceasefire.

The armistice was bitterly attacked by Libya's Colonel Gadaffi, and was unpopular with many Egyptian and Syrian officers. The 1973 war was nevertheless a partial victory for the Egyptian army, which emerged with greatly enhanced morale and self-confidence. The Egyptians were justly proud of their crossing of the Suez Canal, carried out in the face of serious natural and artificial obstacles in the presence of a strongly entrenched enemy. As a result of Dr Kissinger's initiatives, a disengagement on the Suez front was agreed upon in 1975, and the Egyptians currently possess a firm foothold in Sinai.

Further progress towards a peace settlement with Israel proved impossible on the terms Egypt was insisting upon at that time. It was clearly possible for Egypt to arrive at a separate peace with Israel in which the Sinai peninsula would be returned to Egyptian sovereignty, with demilitarisation, observer forces and other safeguards in the area to guarantee against any surprise attacks in future, but the demands Cairo felt compelled to raise on behalf of other Arabs — notably the return of the Golan Heights to Syria, the creation of a self-governing homeland for the Palestinians in the West Bank and the Gaza Strip, and the restoration of East Jerusalem to Arab rule — were unacceptable to any conceivable Israeli government. On the other hand, Egypt was deterred from accepting a separate peace by the certain knowledge that to do so would mean isolation in the Arab world.

President Sadat's negotiating strategy after 1973 was to rely on the USA to bring sufficient pressure on Israel to extract the necessary concessions for a general Arab-Israeli peace settlement. This reorientation of Egyptian policy greatly annoyed Moscow, which retaliated by embargoing almost all arms deliveries to Egypt, and then by refusing even to supply

World Armies

the necessary spare parts for Egypt's almost wholly Soviet-equipped armed forces. Sadat responded by ordering all Soviet military advisers out of Egypt in 1974, and subsequently withdrawing the Soviet Mediterranean squadron's port facilities at Alexandria as well. The Soviet–Egyptian Friendship Treaty was abrogated in 1976. However, this did nothing to solve his basic problem, which was that without adequate spares the Egyptian armed forces were becoming steadily less capable of combat — nor could his growing purchases of Western military equipment even begin to fill the gap. Thus Egypt was even less able to use the threat of military action as a bargaining lever against Israel, while the declining effectiveness of the armed forces was causing a dangerous unrest in the officer corps.

The domestic political situation was also deteriorating steadily in the period 1975–7, as the Egyptian civil population waited with increasing impatience for the peace and prosperity which they had been promised would follow the 1973 war. Amongst the general population there was little sympathy for the Palestinians, on whose behalf it was reckoned Egypt had sacrificed enough already, and no understanding of the wider Arab political situation which deterred President Sadat from making peace with Israel in return for the recovery solely of occupied Egyptian territories.

The immense drain of Egyptian resources into military expenditure for the confrontation with Israel (amounting in many years to one-third of the entire GNP) over a period of three decades were widely seen as the main reason why Egypt, from being the most prosperous and developed Arab country in 1948, has now become one of the poorest. The appalling poverty and congestion of Egyptian cities have made them political powderkegs, where urban mobs easily exploited by the leftist or Islamic rightist opponents of the regime can appear on the streets at a moment's notice. It is clear, moreover, that this situation cannot be defused unless much government expenditure can be redirected from defence and unless foreign investment flows in in very large volumes — and neither of those things could occur until a peace treaty was concluded with Israel. Thus the savage food riots in Cairo in January, 1977 when for a time the army lost control of the streets, were probably the main impetus that impelled President Sadat to change his negotiating strategy.

In November, 1977 Sadat astonished the world by paying a visit to the Israeli Knesset in Jerusalem. Over the succeeding year of negotiations it became clear that he was actually pursuing a separate peace with Israel, while bargaining as best he could for those other Arab interests on which Israeli diplomacy was far less likely to be yielding. In the peace treaty which was signed between Israel and Egypt in early 1979 this impression was confirmed.

The treaty provides for the return of all occupied Egyptian territory in the Sinai peninsula over a period of 3 years, in return for full diplomatic relations and free movement between the two countries. Military security for both parties is to be provided by a wide demilitarised zone on the Egyptian side of the frontier and further zones of limited armament in the rest of the Sinai peninsula and in a narrow zone on the Israeli side of the border, with UN forces patrolling the Egyptian–Israeli border and the western shore of the Gulf of Aqaba, acting as a buffer between Gaza and Sinai, and assuring freedom of passage through the Strait of Tiran.

Provisions for the settlement of the Palestinian problem are much less precise, involving the election of a representative government in the West Bank and Gaza Strip which will, however, remain occupied by Israeli security forces for a 5 year interim period. It is stated that the final status of the area and its boundaries will then be determined in negotiations between Egypt, Jordan, the Palestinian elected authorities (not the Palestine Liberation Organisation) and Israel, but all parties will have a veto on any decisions taken. On the subject of occupied Syrian territories there is not a word.

It is not surprising that Syria, the PLO and a number of radical Arab States have stated their unequivocal opposition to this settlement and declared Sadat a traitor to the Arab cause, but such opposition is unlikely to have any significant effect on Egyptian internal affairs. At the time of writing even the conservative Arab States were keeping their distance from the Egyptian–Israeli settlement, but of these only Saudi Arabia, as a major contributor to the Egyptian budget, is of any great consequence to Cairo. It is scarcely conceivable that Saudi Arabia would adopt any course of action which might encourage the overthrow of Sadat and the re-emergence of a politically radical regime in Egypt — nor, indeed, that it would willingly do anything which might create a heightened danger of an Arab–Israeli war. Consequently, the main factors which will determine the success or failure of Sadat's historic gamble on peace are the reactions of the Egyptian armed forces and the civil population.

So long as peace brings some perceptible improvements in living standards, civilian opinion in Egypt is unlikely to turn decisively against the regime. The armed forces are a more difficult proposition, since they are losing not only their major reason for existence over the past 30 years, namely the confrontation with Israel, but also the swollen military budgets that were the result of that confrontation. Substantial numerical reductions in the forces and a reorientation towards different tasks calling for different types of equipment seem inevitable over the medium term, and could provide many officers with strong personal and professional reasons for opposing the regime and its policies. On the other hand, if the changes are carried out with sufficient slowness and sensitivity, and if adequate sums of money and alternative employments are available to ease the transition, there is no reason that the task cannot be accomplished without outbreaks of resistance — especially as the armed forces are thoroughly penetrated at every level by the intelligence services of the regime.

For further comments on the Egyptian government's strategy for achieving a comprehensive restructuring of the armed forces and a transition from a war to a peace footing without encountering violent opposition, and on its prospects of success, see under the headings Role, Commitment and Deployment, and Current Developments.

STRENGTH AND BUDGET

The Egyptian armed forces have total strength of 395,000 men, and comprise a modest 1% of the population of 40,000,000.

The combined strength of the army and the Air-Defence Command (the latter consisting of army troops, but organisationally a separate service) is 350,000 men, with reserves numbering approximately 500,000. The navy has 20,000 men, plus 15,000 reserves. The air force has 25,000 men, all regulars, and no significant reserves.

There are, in addition, paramilitary forces numbering about 50,000 men, made up of the National Guard (6000), the Frontier Corps (6000), Defence and Security Forces (30,000) and Coast Guard (7000). The Coast Guard and Frontier Corps are organisationally part of the army.

The Egyptian defence budget in 1978-9 was £E1,100,000,000 (\$2,810,000,000), a figure representing about one-fifth of the GNP of \$13,300,000,000. This would appear to be a substantial decline from the 1975-6 defence budget of \$4,370,000,000, but that may be misleading, since in recent years Egyptian military expenditure has been subsidised to an undisclosed but very considerable extent by Saudi Arabia and the smaller Gulf States. It is probable, indeed, that most if not all of Egyptian arms purchases from Western countries requiring payment in hard currencies have been paid for by Saudi Arabia. This makes the surprisingly low figure for military expenditure unreliable as an index of military effort, but very significant nevertheless as an indicator of the decreasing defence burden on the Egyptian economy.

COMMAND AND CONSTITUTIONAL STATUS

The Egyptian constitution proclaims that 'sovereignty is of the people alone'. The People's Assembly, whose 360 members are elected for a 5 year term, is the supreme legislative body. The President, elected for a 6 year term, is the supreme executive authority, and appoints the Council of Ministers, which comprises the Prime Minister, Deputy Prime Ministers and other Ministers. The mission of the armed forces, according to the same constitution, is 'the protection of the socialist gains of the popular struggle, the safeguarding of the country and the security and integrity of its territory'.

The President is Supreme Commander of the Armed Forces, and has an enormous amount of control over them. He appoints the Ministers of Defence and War Production (both serving officers) and the Commander-in-Chief directly, and is empowered by the constitution to appoint all other military officials as well. He presides over the National Defence Council, the senior policy-making body of the government in matters affecting military affairs. He may declare a state of emergency, make treaties and, after obtaining the approval of the People's Assembly, declare war. (In practice, as both 1967 and 1973 showed, this approval may be retroactive.) By the provisions of decrees issued by the President himself, he is the final authority of review of courts martial and must approve all officer promotions. He may also take away seniority, reduce an officer in rank, or reduce him to enlisted status. Moreover, he may delegate these powers to whomever he chooses.

The National Defence Council, a consultative and advisory body without executive powers, assists the President in the formulation of defence policy. Its membership consists of the Prime Minister, the Ministers of Defence, War Production, Foreign Affairs, Interior, Economy and Foreign Trade, the Commander-in-Chief, the Director of the Intelligence Service, the Chiefs of the Army, Navy and Air Force, the Assistant Minister for Air Defence, and other selected officials.

The Minister of Defence has control over the armed forces budget and over economic, industrial and policy matters affecting the military. He is also responsible for the reserves and for veterans' affairs. The Commander-in-Chief controls all four components of the armed forces and is responsible for their organisation, training, armament and administration. In practice these two offices have usually been held by a single officer: the incumbent appointed in October, 1978 was Lieutenant-General Kamal Hassan Ali, the former Chief of Army Intelligence.

Immediately subordinate to the Defence Minister and Commander-in-Chief is the Deputy Commander-in-Chief, who also functions as Chief of Staff and Commander of the Army. According to the formal organisational structure the Commanders of the Navy and Air Force are responsible to this officer in his capacity as Chief of Staff, but these lines of command have not always been strictly observed. In his other capacity, as Commander of the Army, this officer is in charge of the three field armies and the various other army commands such as training, material and intelligence. In most of Egypt's recent wars, it has been the Chief of Staff who has exercised direct control over the conduct of military operations. From October 3rd, 1978 the officer holding this post was Major-General Ahmed Badawi, a front-line brigade commander in 1973 and subsequently Commander of the Third Army.

After the catastrophic loss of most of the Egyptian air force on the ground in the 1967 war, all the Egyptian air-defence troops were placed into a separate Air-Defence Command on the Soviet model. The officer in command of these forces bears the title of Assistant Minister for Air Defence, but despite his cabinet rank he is presumably answerable to the Chief of Staff for operational matters. The nine air force squadrons of air-defence interceptors are operationally subordinate to Air-Defence Command, not to the Commander of the Air Force.

The Defence Ministry, army headquarters and Air-Defence Command headquarters are all in the Cairo area.

The headquarters of the Commander of the Navy are at Ras al-Tin, just west of Alexandria. He is assisted by a Deputy Commander who serves as Chief of Staff, and a staff consisting of five departments responsible for personnel, training, operations, logistics and technical services. Control of operational forces is exercised by a selected senior officer designated Commander of the Fleet.

Air force headquarters are at Heliopolis Air Force Base near Cairo. The Commander of the Air Force has a deputy who

World Armies

serves as his Chief of Staff, and a general staff composed of the chiefs of administration, operations, training, logistics, engineering and supply.

Of the paramilitary forces, the Frontier Force and the Coast Guard come under the control of the army, and the National Guard under the Ministry of Defence. The Defence and Security Forces responsible for the guarding of important public installations and for instruction and supervision of the civil-defence organisation, also come under the control of the Ministry of Defence, but they work with representatives of the Ministry of the Interior in their civil-defence role since that ministry is formally responsible for this task.

ROLE, COMMITMENT AND DEPLOYMENT

The roles of the Egyptian armed forces in the period 1950–70 were four: the elimination of Israel as a political entity and, after 1967, the reconquest of occupied Egyptian territory as a preliminary to that goal; defence against any attempt by 'imperialist powers' to reassert foreign domination over the region; intervention in intra-Arab hostilities in the service of the pan-Arab and 'progressive' causes; and the suppression of any internal uprisings, riots, etc. Defence against external (i.e. European) aggression rapidly lost its urgent priority after the Anglo–French attack of 1956, however, as it became clear that the old imperial powers had lost their will or ability to intervene directly in the Middle East, and so Egyptian deployments from about 1960 were organised to meet the other three tasks.

Prior to 1967 the country was divided for military purposes into four administrative area commands: the Sinai peninsula, the Suez Canal, the Nile Delta, and the long, narrow ribbon of the Nile Valley extending southwards to Sudan, each with major army units under command. The vast desert areas to the east and west of the Nile Valley, comprising some 90% of Egypt's area, were not included in any of the commands. They were the sole responsibility of the Frontier Corps, consisting of a few thousand tough, disciplined troops, mostly mounted on horses and camels, who manned widely separated garrisons and carried out reconnaissance patrols in the border regions.

Since 1967, the army has been continuously in a field command organisation, consisting of I Corps, centred on Cairo with outlying units in the Delta and up the Nile, serving primarily as a reserve and support formation; II Corps, holding the Suez front from the Mediterranean to a point just south of Ismailia; and III Corps, guarding the front from there to the Red Sea. In these circumstances, the old administrative area commands have ceased to function, but the practical effects of the new organisation was the same: the bulk of army troops were facing Israel, while adequate forces were held in the populated regions (and especially around Cairo) for internal security duties. As before, the desert areas remained the responsibility of the Frontier Corps. When it was necessary to supply an intervention force for use in intra-Arab conflicts, as when a large Egyptian expeditionary force was dispatched to fight on the republican side in the North Yemen civil war in 1962–7, the forces were drawn equally from all commands, and operated in the field as an independent command.

This pattern of deployment and the priorities underlying it persisted down to 1973, and indeed were still formally in effect in 1978. Moreover, Egypt's defence commitments beyond the direct confrontation with Israel also remained in force in 1978: its membership in the League of Arab States, which includes the Arab Defence Council and the Unified Arab Command among its subsidiary bodies; its separate defence agreements with Jordan, Iraq and Libya; and its membership with Syria and Libya in the Federation of Arab Republics, which envisages a federal defence council and a unified military command (and briefly in 1973 actually did have a joint Egyptian–Syrian command). But the Arab League has never actually had Egyptian forces placed at its disposal (and is unlikely to ask for them now), while Syria, Iraq and Libya all openly advocate the overthrow of the Egyptian government for its peace agreement with Israel. Even the mutual defence agreement with Jordan must be considered in abeyance.

In other words, Egypt's overwhelming concentration of land forces on the Sinai front facing Israel, and its residual military obligations to various inter-Arab alliances and organisations whose principal purpose was to co-ordinate the battle against Israel, have all become obsolete. While a need to maintain military forces near the Israeli border will doubtless persist indefinitely, it no longer calls for such a great weight of forces: the commitment to eradicate Israel is gone, and the recovery of the occupied territories no longer requires a military effort. The military role in internal security is unchanged, but is adequately met by the normal distribution of support forces in the populated areas of the country. As for the intervention role, it has changed in purpose under the present leadership from that of backing 'progressive' and revolutionary forces in the Arab world under Nasser to that of preserving moderate and conservative regimes, but it has actually expanded in scope to include not just the Arab world but much of Africa.

Within the shell of the old force structure, one is beginning to see the emerging outlines of a new pattern of armed forces organisation and deployment conforming to the new military priorities, which are essentially two-fold: a defensive capability on the Israeli border, and a highly mobile intervention force capable of operating not only (or even primarily) in Arab countries, but also in the northern and central parts of the African continent.

For the first task, it is necessary to maintain and refurbish at least a significant proportion of what may be called the 'old' army: the armour-heavy, Soviet-equipped force which was built up over the past 30 years to fight Israel. Since the bulk of army officers have made their career in this force and will continue to do so, it cannot be neglected for political reasons; in any case, a credible defence force against Israel will still be required even after full peace is established. The necessary degree

of modernisation of this force is being carried out with Western aid, but there is no question that it is being allowed to run down considerably from the peak strength achieved in 1973. (For details, see Equipment and Arms Industry.)

Parallel to this 'old' army, an intervention force is being created which will allow Egypt to effect events in countries to the east, south and west of her. In Arab terms the key-stone of this policy is the mutual defence treaty signed between Egypt and Sudan in July, 1976 (after the most recent Libyan attempt to overthrow the Sudanese government) and the financial support and political backing of Saudi Arabia. Other nations with which Egypt more or less closely co-ordinates policy in this area are the USA, France and Morocco. The shared perception of all these countries is that the major threat to regional stability in the Arab world, and especially in Africa, is the collaboration of the Soviet Union with local radical regimes like Libya, Angola and Ethiopia in attempts to overthrow moderate and conservative regimes. For various reasons of their own both Saudi Arabia and the USA find it unsuitable to provide intervention forces to cope with such threats themselves, but are prepared to support a volunteer like Egypt with money and arms supplies.

Thus one finds that a very substantial proportion of Egyptian arms purchases from Western countries since 1975 (mostly paid for by Saudi Arabia) have been of weapons far more suited to the low-intensity combat environment likely to be encountered by intervention forces in Africa than to the sophisticated and deadly battlefields of another Arab-Israeli war: C-130 Hercules transport aircraft and F-5E fighter-bombers from America, Alpha Jet strike/trainer aircraft from France, and Lynx and Commando helicopters and SRN-6 hovercraft from Britain. In seeking permission to buy the F-5Es from the USA, President Sadat was quite explicit that they were intended to create a defence (and intervention) capability in Egypt's African border regions where the Soviet/Cuban presence was a growing threat, i.e. in the Ethiopia-Sudan-Uganda-Chad-Libya area.

Indeed, minor instances of such Egyptian military interventions have already occurred. During 1977-8 Egyptian pilots and other military aid specialists were sent to Zaire, alongside French and Moroccan forces, to aid that country in repelling an invasion by rebels based in Angola. Egyptian military advisers (and according to some reports, Egyptian military supplies) went to assist the Chad government in resisting the attacks of Libyan-backed rebels. Egyptian transport aircraft illegally overflew Kenya in the process of delivering military aid to Somalia during the final phases of the Ogaden war, and Egyptian commandos were involved in a disastrously bungled operation in Cyprus to rescue the hostages in an airliner hijacked by Palestinian terrorists. The most notable instance of this sort of operation was the brief Egyptian-Libyan border war in July, 1977 (see Recent Operations).

Hitherto there has been no evidence that the command structure of the armed forces has been substantially changed to take account of these new priorities and missions, but the Libyan clash has occasioned a significant redeployment of Egyptian forces. It is now understood that about 15% of the armed forces' combat strength — about 35,000 men, 200 tanks and 80-100 combat aircraft — are positioned along and behind the Mersa Matruh-Sollum front in the Western Desert facing Libya. They probably come under the control of I Army Corps in Cairo, but it is possible that they may constitute a separate command.

If current trends continue, it may be anticipated that progressively larger proportions of the Egyptian defence effort will be directed away from the Israeli border, with the emphasis in the newer forces being placed on long-range maritime and air-transport capabilities in support of operations in Africa at some distance from Egyptian bases.

RECENT OPERATIONS

The recent operations of the Egyptian army are of very great political and military significance. Not only have they affected the balance of power in the Middle East and relations between the superpowers, but they have also provided practical examples of the potentialities of modern weapons and tactics.

The Egyptian army suffered total defeat in the Six-Day War of 1967, largely as a result of the pre-emptive Israeli air strike which destroyed much of the Egyptian air force on the ground and thereby deprived the army of air cover. Egyptian forces in Sinai, some seven divisions in all, were deployed in what General André Beaufre called 'a curious Soviet style' in a number of strong defensive positions. The Egyptian front was penetrated by three major thrusts: several positions were taken by direct assault, and retreating units were severely mauled by the Israeli air force. Israeli victory was, though, by no means cost-free. Some formations fought doggedly: a brigade defending Rafa lost about a thousand men before it was overrun. A number of Israeli senior officers commented that the Egyptian army's greatest weakness was its officer corps — Egyptian soldiers, when well led, were capable of giving a good account of themselves.

The 1973 campaign provided the Egyptian army with considerable compensation for the humiliations of 1967. The strategic considerations were, admittedly, somewhat different: the war had limited political aims, and the military planning of Egyptian operations was consequently linked to an attainable political objective. Ismail correctly assessed the strengths and weaknesses of the Israelis: he noted their air superiority, technical skill and American support, against which he weighed their long lines of communication, manpower difficulties, vulnerable economy and dangerous over-confidence.

The crossing of the Suez Canal and the breaching of the Israeli Bar-Lev line were the most serious practical problems facing the Egyptians. The Canal was a significant obstacle in itself, and the Israelis had strengthened it by increasing the height and width of the sand bank on its eastern edge. Opening gaps in this bank with explosives or bulldozers would be

World Armies

time-consuming, but it was impossible to cross it with vehicles until adequate breaches had been made. An Egyptian engineer officer discovered that high-pressure water hoses could successfully open a gap in such an obstacle, and steps were accordingly taken to breach the bank by this means. While the breaching was in progress, infantry armed with anti-tank and anti-aircraft missiles were to scale the slope to prevent Israeli armour or aircraft from interfering with the engineers. The strength of the air defence on the Egyptian side of the Canal was, in any case, likely to make Israeli air operations in the vicinity of the Canal both difficult and costly. Once the Canal and sand bank had been crossed and the Bar-Lev line pierced, Egyptian armoured formations, with integral air defence, would be able to press on into Sinai.

Intensive training for the crossing was carried out on an Egyptian-held loop of the Canal and on stretches of the Nile. Ismail took particular care to eliminate 'trench fever' which had infected the Egyptian army as a result of its long emphasis on defence. He also endeavoured to revitalise the officer corps, paying particular attention to the leadership ability of junior officers. Ismail's training programme met with considerable success. His deception plan was similarly fruitful. Defensive positions were constructed on the west bank of the Canal, to give the Israelis the impression that the Egyptians proposed to remain on the defensive. Bridging equipment was camouflaged in large hides near the Canal, and a feint road-building project was commenced in the marshy ground at the northern end of the Canal.

The Egyptian assault began on the early afternoon of October 6th. The defenders of the Bar-Lev line were taken by surprise, and missile-armed Egyptian infantry held off Israeli armour and aircraft while Egyptian tanks crossed the Canal. Two armoured and two infantry divisions formed the first wave of the attack, and by October 13th the Egyptians had pushed about 1000 tanks into Sinai, taken most of the Bar-Lev forts and all but destroyed an Israeli armoured brigade which had attempted to counter-attack. Up to this point Egyptian forces enjoyed the military advantages of following a well-prepared, highly detailed operational plan, and of standing on the tactical defensive against an enemy who was not adequately trained for attacks against their sophisticated range of anti-aircraft missiles and automatic guns. In retrospect it appears that the impact of Egypt's anti-tank missiles was less significant for the outcome of the battle than was believed at the time (except in the very first stage of the war, when no other anti-tank defences were available to the Egyptians east of the Canal), but the Israeli armour suffered grievously from being unable to count on its usual air support when operating under the umbrella of anti-aircraft defences extending well forward from the Egyptian lines.

By the mid-point of the war, however, anxiety about the shallowness of Egyptian positions in the east bank of the Canal, a certain degree of over-confidence in the Egyptian command, and the urgent need to draw off the main weight of Israeli strength from hard-pressed Syria conspired to make the Egyptians change their tactics. Abandoning the tactical defensive, Egyptian armour went out in strength beyond the cover of their own anti-air and anti-tank defences, seeking a decisive battle. They found it, and within the space of 12 hours they lost it. On October 14th, the Israelis got the best of a massive armoured battle in the area of the Mitla and Gidi passes, and on the night of October 15th/16th they managed to force a crossing of the Canal just north of the Great Bitter Lake. By October 17th a firm bridgehead was established on the west bank, and Israeli armour pushed southwards to encircle the Egyptian Third Army. The ceasefire came barely in time to save the Third Army from collapse, but left the Israelis in possession of a belt of Egyptian territory running from Ismailia to the Gulf of Suez. The Egyptians nevertheless remained in strength on the east bank of the Canal, and subsequent negotiations were to enable them to take possession of the territory between the Canal and the western ends of the crucial Sinai passes.

The Israeli General Arik Sharon admitted that the Egyptian army had performed infinitely better than in previous campaigns. 'I have been fighting for 25 years,' he remarked, 'and all the rest were just battles. This was a real war.' General Ismail maintained that the Egyptians had changed the world's opinion of them, and to some extent he was right. In strictly military terms the Egyptians and their Syrian allies had lost more territory than they had gained, but this loss was to a great extent remedied by subsequent disengagement agreements. The war had certainly fulfilled most of its political objectives: the Middle East was brought forcefully to the attention of the superpowers, who exerted pressure to bring about a cessation of hostilities and a more lasting peace. America's attitude was doubtless heavily influenced by Arab use of the potent oil weapon: on November 20th the hitherto conservative Saudi Arabia announced the suspension of its oil exports to the USA.

The Egyptian army's performance had been impressive but by no means flawless. The crossing of the Suez Canal and the breaching of the Bar-Lev line were carried out with almost textbook precision. Subsequent operations were less creditable. The Egyptian high command reacted slowly to a fluid situation: Egyptian response to the Israeli crossing of the Canal was painfully slow. The war nevertheless did much to efface the shame of 1967. The Egyptian high command had shown that it could plan and execute complex operations, junior leadership had clearly improved and the army's morale had, in the main, been remarkably high.

The main Egyptian military operation since 1973 was the brief, limited attack on Libya in July, 1977. This was undertaken in response to an extensive Libyan-sponsored campaign of sabotage and subversion in Egypt, aimed at displacing President Sadat. The Egyptian attack, similarly, was intended to provide the occasion for all Libyan opposition elements to unite and overthrow Colonel Gaddafi.

The attack was well-prepared in advance, and was launched on July 21st with no warning. Egyptian armour crossed the frontier, while air force raids hit the major Libyan air base at Al Adem near Tobruk without encountering opposition. Little damage was done to the base, however, and subsequent raids were opposed by Libyan SAM defences. The army reported that it had put the Libyan 9th Armoured Battalion out of action, with 50% of its equipment destroyed, but this was not confirmed. The fighting on the ground never moved far from the frontiers, and after 4 days a ceasefire was accepted by both

sides. The Egyptian political aim was not achieved, as the fighting served only to rally the Libyan population to the support of Colonel Gaddafi, but the military performance, at least of these picked troops, was satisfactory in most respects.

ORGANISATION

Branch of Service

The army is primarily an infantry force; the other combat branches are armour, artillery, engineers, airborne and commando. The services consist of supply and transport, military works and survey, signals, chemical, medical and the other usual specialties. The army contains the Frontier Corps, which patrols the desert borders, and the Coast Guard, which has a coast-defence combat mission in wartime and in peacetime concentrates on anti-smuggling operations.

Naval officers and ratings are divided into the usual specialties more or less along the lines followed by the British Royal Navy. There are no naval aviators, nor is there any marine corps, but there is an element of naval infantry whose principal purpose is commando raids.

Air force flying personnel are classed as pilots, navigators and observers; there are the usual variety of branches for non-flying specialists. The Air-Defence Command is a separate service.

Operational

The Egyptian army's tactical organisation revolves around the division and brigade structure. There are two armoured divisions, three mechanised infantry divisions, five infantry divisions, plus one Republican Guard Brigade of divisional size. The armoured divisions contain one armoured, two mechanised and one artillery brigade each; the mechanised infantry divisions lack the armoured brigade but are otherwise the same. The infantry divisions have only two infantry brigades each. There are a further three independent armoured brigades, seven independent infantry brigades, two airmobile brigades, two parachute brigades, six commando groups, six artillery brigades, two heavy mortar brigades, one ATGW brigade and two SSM regiments.

An armoured brigade contains three tank battalions, and AA company with guns and missiles, together with motorised infantry, armoured reconnaissance, engineer, signals and headquarters companies. A mechanised brigade has three mechanised infantry battalions, supported by a tank battalion and mortar, AA, anti-tank, pioneer, armoured reconnaissance, signals and headquarters companies. An artillery brigade normally contains a battalion of M-63 122mm D-30 howitzers, a battalion of 122mm D-74 guns, three battalions of M-38 122mm howitzers, a battalion of 160mm and 240mm heavy mortars, an anti-tank battalion with SU-100s, a light anti-tank company with Sagger ATGWs mounted on GAZ 69 jeeps, and anti-aircraft, signals, engineer, mechanised infantry and headquarters companies. Artillery battalions usually contain four batteries of guns/howitzers.

The field army comprises three corps. I Corps, base mainly in the lower Nile valley and the Delta with forces extending westwards towards Libya, is the main repository of training and support formations and also the home of most of the commando, airmobile and paratroop units which are the army's main contribution to Egypt's new capability for intervention abroad. The security of the government in Cairo is ultimately guaranteed by the outsized Republican Guard Brigade, which is not in the corps organisation. II and III Corps, holding the northern and southern parts of the Israeli front, respectively, each have one armoured division, one or two mechanised infantry divisions, two infantry divisions and a number of artillery units. Each of these two corps also has an SSM battalion, one being equipped with 30 FROG-4/-7 missiles, the other with 24 Scud B and Samlet SSMs.

The greater part of the operational structure and doctrine of the Egyptian army is still derived from the Soviet Union, but there has been a slow, steady shift towards Western operating procedures as increasing amounts of Western-built equipment enter the Soviet inventory.

The navy's principal operating base is at Ras al-Tin, but a portion has been kept in the Red Sea permanently since 1967. Support facilities are now available in this area as well. The fleet is organised into four major commands: destroyer, submarine, mine warfare and torpedo boats. There is no marine corps but a naval infantry force is maintained.

The air force has an administrative superstructure of air regiments for its ground-attack aircraft (three fighter-bomber regiments and five FGA-strike regiments) but even here the basic tactical unit is the squadron. There are also three light/medium bomber squadrons, nine interceptor squadrons, and a number of transport and helicopter squadrons. The interceptor squadrons come under the operational control of Air-Defence Command.

RECRUITMENT, TRAINING AND RESERVES

The National Military Service Law of 1956 imposed an obligation to perform 3 years of military service on all Egyptian males not specifically exempted by law. Males are required to register for national service at the age of sixteen, but none is inducted before twenty or over thirty-five. Service may be performed in other quasi-military public services — work

World Armies

battalions, police, fire departments or the prison administration — and thirteen specific categories of people receive automatic exemption: the physically unfit, only sons, sole supporters of a family, etc. There are also discretionary exemptions for government employees and essential industry workers, and deferments for university students up to the time they leave school or to the age of twenty-eight, but on the whole the system has worked fairly and eliminated most of the old abuses.

The armed forces only require an annual intake of about 100,000 recruits to maintain their present level, however, while the number of fit men reaching military age each year is several times greater than that. Accordingly, the system is actually one of selective service. The country is divided into draft zones, and conscripts are selected annually by zonal councils composed of senior military officers, civil officials of the governorate and a team of medical officers. Local mayors and village chiefs participate in examining the prospective recruits. After exemptions and deferments have been ruled on, conscripts are chosen by lot from the available pool of eligible men, and the names forwarded to the Draft Administration in Cairo.

Military service is not unattractive to many Egyptians, as it offers better living conditions and prospects for advancement than are available to a large proportion of the community in civilian life. Thus NCOs in all services are almost always regulars, chosen from amongst qualified volunteers from the ranks, and the services can afford to be highly selective in whom they accept. Indeed, even in the enlisted ranks almost all air force personnel are volunteer regulars. In the navy, volunteers and conscripts are about equal in numbers below NCO level. Only in the army are a large majority of the lower ranks conscripts.

Basic training for new troops follows the usual indoctrination pattern, but the Egyptian forces have to pay special attention to raising the educational level of some conscripts to the point where they can cope with modern weapons and techniques. For many years it was necessary to give simple literacy training to large numbers of new recruits; this is no longer a major problem, but other basic education courses still have to be given to many conscripts. The training is done at the 'Liberation Schools' run by the army, some of which can grant secondary school certificates qualifying graduates for university entrance.

After basic training and any necessary remedial instruction, army recruits usually attend the branch school of their assigned arm or service, located at one of several training centres throughout the country, for a period of from 3 to 6 months. They then participate in the annual cycle of army training, commencing with individual weapons training at the beginning of the year and working up to army-wide exercises in the autumn, which has been largely adhered to even during the period since 1967 when most of the army has been in a continuous combat posture.

At the end of the period of obligatory military service, selected volunteers attend a command school and are accepted as regular NCOs. There is a wide variety of opportunities for specialised technical training for NCOs both at local units and at branch schools. Many NCOs have received advanced training abroad at Soviet-bloc branch, staff or technical schools, or latterly at their Western equivalents. The army runs an advanced career school for senior NCOs at Almazah in Cairo.

Navy enlisted men go from basic training to 6 months of shipboard duty, followed by 6 months of advanced training that qualifies them for a specialist school. Successful candidates then attend specialist courses in quartermaster, communications, armament, supply or seamanship. Individual ship commanders are responsible for training their own crews, but there are further technical courses and an advanced career school for NCOs at the navy's training centre at Ras al-Tin.

Air force enlisted training is mainly devoted to developing ground-crew skills, and after basic training almost all airmen are sent to the technical schools — aviation mechanics, radio, radar, ordnance and aerial photography — which are located at Heliopolis Air Force Base near Cairo. At the highest level, there is an interservice school conducted at Ministry of Defence level for exceptionally well qualified NCOs which includes on-the-job training in senior-staff operations.

Egypt is unusually fortunate amongst Arab nations in having this large, competent and experienced cadre of NCOs. On average they have had more than 10 years' service and experience of at least one war; thanks to the comprehensive technical and professional education system they are also likely to be proficient in their speciality. In many ways, they constitute the backbone of the Egyptian armed forces.

Regular officers are trained in the three service academies and in the tri-service Armed Forces Technical College. Admission requirements vary somewhat, but generally provide that candidates have general secondary certificates or high school diplomas with good average grades, be under twenty-one (the air force takes college graduates up to twenty-four), be of good character and never have been married. They must also pass competitive examinations and physical-fitness tests. Certain preferences are given to sons of serving and retired officers and to sons and brothers of those killed in war.

The Military Academy, sometimes called the War College, is in Cairo. It provides a 3 year course which includes comprehensive infantry and leadership training as well as a rigorous academic programme. Graduates are commissioned as second-lieutenants and go on to specialised courses conducted by their own branch schools before joining their units.

Both navy midshipmen and air force cadets also spend the first year of their training at the Military Academy, as do prospective students of the Armed Forces Technical College. Navy midshipmen then proceed to the Naval Academy at Ras al-Tin for 3 years, of which the first two are largely devoted to academic work and the third is spent mostly at sea. Air force cadets go from their year at the Military Academy to 3 years at the Air Force Academy at Bilbeis, 25 miles north-east of Cairo, where they pursue a curriculum divided into three 1 year terms of theoretical, technical and scientific training and interspersed with 250 hours of flying instruction. Upon completion of flying training and after passing the academic examinations, graduates are appointed pilot lieutenants and granted a bachelor of aviation degree. Those who fail to qualify

as pilots may be given ground administrative assignments or may revert to the army. The Navigators' School and the Observers' School are also part of the Academy at Bilbeis, and much of their curricula is common with that of the other cadets.

The Armed Forces Technical College in Cairo was founded to produce competent technical officers for all the services: applicants must have a particularly good academic record in science, and must pass examinations in algebra, trigonometry, analytical geometry and mechanical engineering. They must also complete a 1 month selection camp, and 1 year at the Military Academy. Their 3 years of training are divided into intermediate, higher and scientific research stages, after which they graduate as first-lieutenants. Since 1969 civilians have also been allowed to attend the College; on the other hand naval technical officers now spend only 1 year there, followed by two further years at the Naval Technical College which was opened at Ras al-Tin in 1969.

Enlisted men who can qualify are eligible for entry into any of the academies.

There is an extensive system of technical, branch and staff schools providing for the further education of Egyptian military officers. Probably the most important is the Army Staff College, founded in 1939, offering instruction to officers of major/lieutenant-colonel rank. The syllabus includes tactics, logistics, organisation, planning and administration up to divisional level. Much attention is given to the specific strategic circumstances of the Middle East.

The highest level of the military educational system is the Nasser Institute, founded in 1964, which gives senior officers time and opportunity to consider the problems of war on a broader scale. Strategy, tactics, and the political, economic and social aspects of national mobilisation are part of the curriculum. Large numbers of officers of both middle and senior rank also attend staff colleges and other advanced schools abroad: in the first years after independence these were mostly in Britain, France and the USA; after 1955 they shifted to Soviet-bloc countries, and since 1973 they have been mainly in the West once again.

While this may make for a confusion of doctrines, it certainly does tend to broaden officers' perspectives. There is little question today than an Egyptian officer at divisional- or corps-command level is the professional equal of his Russian, American, German or Israeli equivalent. He will have had the benefit of his own good military educational system; experience at a Soviet or a Western senior staff college (or, in some cases, both); and the inestimable advantage, shared only by his Israeli opposite number, of having commanded forces in full-scale modern warfare at every stage of his career, as a junior officer in 1956, a field-grade officer in 1967 and a brigadier in 1973.

Egyptian reserves officially number 500,000 men for the army and 15,000 for the navy. (The air force has practically none since it takes few conscripts.) When enlisted men finish their 3 year duty they are placed in the reserves for 9 years, during which the government can recall them for an additional 3 years. It is possible for college students to fulfil their military obligations by taking military training in term and spending parts of their vacations in military labour battalions; indeed some form of military training is obligatory for all male and unmarried female college students, and passing military examinations is a prerequisite for graduation. Those who wish may seek commissions by attending the Reserve Officers' Academy at Faid, about 30 miles north-west of Suez.

Reserves are used extensively in the various military training programmes in schools and civil-defence organisations, but it is not clear how useful they are for combat purposes. Some, certainly, are members of clearly defined units that train together and can reasonably be counted as part of the army's fighting strength on mobilisation; these would be a few tens of thousands. A larger number, comprising perhaps 250,000–300,000 men, have sufficiently fresh military experience (in the previous 3–4 years) to be useful as individual reinforcements or replacements to existing units, and many men of this category have been mobilised in past crises. The remainder of the reserves constituting that suspiciously round number of 500,000 men are probably of no serious military significance.

EQUIPMENT AND ARMS INDUSTRY

The main armoured strength of the army consists of 850 T-54/-55 and 750 T-62 medium tanks, plus 80 PT-76 light tanks. These are supplemented by 300 BRDM-1/-2 scout cars and 200 BMP-76PB MICVs. The mechanised infantry are borne in a total of 2500 OT-62/-64, BTR-40/-50/-60/-152 and Walid APCs.

The artillery arm consists of 1300 76 mm, 122 mm, 130 mm, 152 mm and 180 mm towed guns and howitzers and about 200 SU-100 and ISU-152 SP guns, plus 300 120 mm M-43, 160 mm M-53 and 240 mm M-63 mortars and 300 122 mm, 140 mm and 240 mm rocket launchers. Surface-to-surface missiles include 30 FROG-4/-7s, 24 Scud Bs, and Samlets.

The army's anti-tank armoury consists of 900 57 mm M-55, 85 mm M-45 and 100 mm M-55 ATK guns, 900 82 mm B-10 and 107 mm B-11 recoilless rifles, and 1000 Sagger, Snapper, Swatter, Milan and Beeswing ATGWs, plus large numbers of RPG-7 rocket launchers. Its integral air-defence weapons comprise 350 ZSU-23-4 and ZSU-57-2 SP AA guns and SA-7/-9 SAMs. A large number of M-113 APCs are on order from the USA (the figure of 800 has been mentioned) and \$35,000,000 worth of Swingfire long-range ATGWs from Britain.

The Air-Defence Command is equipped with 360 SA-2, 200 SA-3 SAMs in fixed emplacements and 75 mobile SA-6 SAMs; associated missile radars are Fan Song, Low Blow, Flat Face, Straight Flush and Long Track. The Air-Defence Command also has 2500 20 mm, 23 mm ZU-23, 37 mm M-39, 40 mm, 57 mm M-50, 85 mm M-44 and 100 mm M-49 AA

World Armies

guns, served by Fire Can, Fire Wheel and Whiff gun radars. Early-warning radars are Knife Rest and Spoon Rest. Delivery is now beginning of a substantial order for Crotale mobile SAMs from France.

The air force has a total of 612 combat aircraft, but many Soviet-supplied aircraft are grounded for lack of spares. The actual operational strength is below 475 aircraft. The principal air-defence weapon is the 108 MiG-21 MFs, configured in the interceptor mode and organised in nine interceptor squadrons, which operate under the control of the Air-Defence Command.

The remaining combat strength, which fights under air force operational control, consists of three fighter-bomber regiments equipped with: 80 MiG-21F/PFMs and 90 old MiG-15/-17s; five fighter-ground attack-strike regiments flying 70 Su-7s, 19 Su-20s, 21 MiG-23s and 46 Mirage VDE/DDs; one light bomber squadron with five Il-28s, and two medium bomber squadrons with 23 Tu-16 D/G aircraft. Air-to-air missiles are AA-2 Atoll and R.530; air-to-surface missiles are AS-1 Kennel and AS-5 Kelt.

Transport aircraft include seven C-130Hs and 2 EC-130Hs, 26 Il-24s, 19 An-12s, one Falcon, one Boeing 707 and one Boeing 737. Helicopters include 20 Mi-4s, 32 Mi-6s, 70 Mi-8s, 30 Commandos and 54 Gazelles; some of these are dedicated to battlefield tactical support in the anti-tank or troop transport roles. Air force trainers consist of 150 MiG-15/-21/-23Us, Su-7Us and L-29s, plus 45 Egyptian-built Gomhourias.

The air force has on order 50 F-5E/F fighters (deliveries beginning late 1978) and 10 C-130Hs from the USA; 14 more Mirage V fighters from France and 50 Lynx helicopters from Britain.

The Egyptian navy has 12 ex-Soviet submarines (six W-class and six R-class), five destroyers (four Skory-class, one ex-British Z-class) and two ex-British escorts. Its specialised anti-submarine strength consists of 12 SO-1 submarine chasers and six Sea King ASW helicopters; mine counter-measures craft are six T-43-class, four Yurka-class, two T-301-class and two K-8-class MCM vessels. The main striking force is the 16 missile-firing fast patrol boats (six Osa-I-class and 10 Komar-class with Styx surface-to-surface missiles, now being replaced by Otomat SSMs) and the 26 motor torpedo boats (six Shershen-class and 20 P-6-class). Other craft include three Polnocny-class LSTs, 13 smaller utility landing craft (nine Vydra and four SMB-1), and three SRN-6 hovercraft. New naval orders in 1977 were for two Lupo-class frigates, two Agosta-class submarines and 30 Otomat missiles from Italy, and six Vosper Ramadan-class FPBGs and three more SRN-6 hovercraft from Britain. Negotiations are also well advanced on the proposed refitting and purchase from Britain of one Devonshire-class frigate, one Lincoln-class destroyer and one Salisbury-class destroyer.

The striking point to emerge from these figures is that Egypt has made no effort whatever to replace the approximately 800 tanks that were lost in the 1973 war, let alone to match the subsequent further expansion of the Israeli forces. The Egyptian armoured force of today consists of what was still surviving on the last day of that war, less subsequent attrition. The same is true for all other categories of armoured vehicle and all types of artillery. The extent of Egyptian loss of interest in maintaining an offensive capability against Israel may be measured by the fact that Egypt now has substantially fewer main battle tanks than Syria or Iraq — or alternatively, by the fact that Israel outnumbers its two major opponents of 1973 in total tank strength.

Scarcely anything new has been bought for the army since 1973, except anti-tank guided weapons: Swingfire to extend the anti-tank cover over a wider area than the old first-generation Soviet ATGWs in Egyptian hands could do, and Milan and Beeswing for the nearer distances. But this is scarcely surprising in that Egypt no longer expects to have to attack Israel — for a defensive war her arms are probably sufficient, and tanks are not the sort of delicate machinery that instantly fail if the flow of spare parts slows. Thus the stringent Soviet arms embargo against Egypt in order to browbeat President Sadat into compliance has not had marked effects on the army's efficiency and readiness, nor has it been seen as expedient or necessary to buy the army new weapons. It is here an advantage, of course, that tanks and other bulky steel weapons do not deteriorate if left in a desert climate.

One can see at the most nothing more than a policy of replacing old with new in the navy's weapons-buying pattern since 1973. Air-Defence Command's purchase of Crotale SAMs is understandable in view of the fact that its SA-2 and SA-3 missiles, the heart of its system on the Canal, are now approaching an age at which their reliability will fade (none has been supplied since 1973, and their 'shelf life' is estimated at 5 years). The Egyptian purchase of Crotales is for a minimum of eight batteries, each consisting of one target acquisition unit and three launching units (with four launchers each).

By far the greatest problems caused by the Soviet refusal to supply spare parts for weapons Moscow had previously sold to Egypt have been experienced by the air force, whose numbers of operational aircraft and average monthly flying hours have declined drastically over the period 1973-8.

Orders for a total of 60 Mirage V fighter-ground attack aircraft have been placed with France since 1973 (initially routed via Saudi Arabia as the purchaser of record), and delivery has been taken of 46 of them. In 1975 Egypt received the last of 48 MiG-23s that had been ordered from the Soviet Union by firm contract before 1973 (41 are still in service). Deliveries have now begun of the 50 F-5E/F light fighters that the USA agreed to sell Egypt in mid-1978 as part of a three-way compromise deal that also involved large aircraft sales to Israel (15 F-15s and 75 F-16s) and to Saudi Arabia (60 F/TF-15s). Amongst non-combat aircraft, the Egyptian air force has taken deliveries since 1973 of 30 Commando and 54 Gazelle helicopters, and placed orders for 19 C/EC-130 Hercules (about half delivered) and 50 Lynx helicopters.

But these are scarcely adequate acquisitions over a period of 7-8 years to maintain the modernity of an air force which once boasted over 650 combat aircraft. For the rest the Egyptians have been reduced to reconditioning old aircraft wherever they could, and trying to create their own domestic arms industry as a long-term solution to the problem of arms

embargoes. In early 1977 the Soviet Union finally returned 50 of 175 MiG-21 engines that had been sent there for overhaul, but apart from that most of the work has been done by China and Britain.

The Chinese began supplying Egypt with desperately needed spare parts for its 90 old MiG-17s in July, 1976 reportedly in exchange for a MiG-23 which they hoped to use as a model (fitted with licence-built British Spey engines) for their own new fighter soon to be produced in Sian. Chinese assistance may have extended to the supply of new engines for MiG-17s and even some new (surface-to-surface?) missiles, according to various reports, and a military protocol was signed by the two countries in late 1976, but most of the reconditioning work is in fact being done by British firms.

The most urgent item on the list was undoubtedly the 200-plus MiG-21s that provide the backbone of the Egyptian air force. The Hawker Siddeley side of British Aerospace and Rolls Royce were deeply involved in servicing the engines of some 80 MiG-21s in early 1978, and the aircraft have been successfully tested with a Smiths Industries head-up weapons delivery system. Vosper Thornycroft agreed in 1977 to overhaul and update the navy's Russian-built missile boats, and to fit new Otomat missiles to the Osa boats in place of the obsolescent Styx SSMs, while Egypt's six Whisky-class submarines are also being gutted and refitted with British equipment. Other British firms are involved in the overhaul of the army's ageing T-54/-55 tanks.

None of this comes a moment too soon for Egypt's air force in particular: despite the measures being taken to bolster the aircraft serviceability ratio, pilots in 1978 were flying less than half the monthly rate of sorties which Western air forces would regard as a working minimum. Out of a nominal 612 aircraft, and an actual total of less than 475 which are considered to be still 'operational', the number actually capable of getting into the air on a given week has reportedly dipped below 150 repeatedly during 1977-8.

Arab Organisation for Industrialisation

The only long-term answer to Arab arms dependence on fickle outside suppliers has long been recognised to be the establishment of a domestic arms industry — or perhaps two, to supply the conservative and the 'radical' countries, respectively. In the aftermath of the 1973 war a number of Arab conservative States found themselves in a position to fund such a development, thanks to greatly increased oil revenues. Not having the large skilled labour forces themselves that would make such a transfer of technological skills from the industrial countries possible, they found in Egypt a similarly pro-Western, conservative State which could supply the workforce for such an Arab arms industry.

Thus was created in May, 1975 the Arab Military Industrial Organisation (subsequently renamed the Arab Organisation for Industrialisation — AOI), with a founding capital of \$1,040,000,000 contributed by Saudi Arabia, Qatar, the United Arab Emirates and Egypt. The Chairman was Ashraf Marwan, President Sadat's son-in-law. Kuwait, which was asked to join and to contribute \$400,000,000 to the organisation's capital, has consistently refused to do so because of doubts about the enterprise's commercial viability. This is perhaps not surprising, in view of the AOI's serious undercapitalisation, but various Western arms manufacturers have nevertheless been prepared to enter into co-production and technology transfer agreements with the organisation because of the privileged access to the large Arab market which it offers. It is intended that any arms produced by AOI plants should be sold to most or all of the participating States, not just to that in which a particular factory is located.

Although the AOI agreed with several American concerns in February, 1978 to establish a joint company for the manufacture of military electronic equipment in Saudi Arabia and has studies underway to build arms factories in Qatar and the United Arab Emirates as part of a strategy to disperse its facilities 'to avoid their being targets of attack in times of crisis', it was always recognised that the bulk of its plants must be in Egypt, the only member with any existing industrial expertise and capacity. The idea was to build on the small existing Egyptian arms industry, the only one in the Arab world, by injecting large amounts of Western capital and technology.

The Egyptian arms industry began to be developed even before the 1952 revolution, and got a significant impulse when a centralised Ministry of War Production was created after the 1956 war. It moved from production of small arms like the 7.62mm Rashid assault rifle and the 9mm Port Said sub-machine-gun (a copy of the Swedish Carl Gustav M-45 built under licence) to limited production of the now obsolescent Walid APC (powered by a German Deutz engine and externally resembling a four-wheeled version of the BTR-152) and of an SP gun (essentially a marriage of an M-63 122mm gun with a T-34 tank chassis). All kinds of ammunition and minor military equipment are produced, and the four existing munitions factories, now under AOI auspices, have recently been producing spare parts for tanks and mobile bridge-laying equipment. They are also carrying out such modifications to existing equipment as the fitting of anti-tank missiles to T-62 tanks and Gazelle helicopters and the mounting of SA-7 anti-aircraft missiles on American Motors jeeps (now being produced in Egypt).

Egypt's pre-1973 essays in the production of more sophisticated weapons, however, were uniformly unsuccessful. In 1949 Egypt began turning out light training aircraft under licence from various European countries (of which the air force's Gomhouria trainers are the sole surviving examples), but a large expenditure of money and effort in the 1950s in an attempt to design and produce an Egyptian jet fighter with the aid of German experts failed to result in a useful product, and the project was eventually shelved. A parallel attempt to produce surface-to-surface missiles, also with the aid of a German team, was begun and halted again three times in 1948-60; it was announced in 1966 that three types of missiles had been produced, but they never achieved sufficient reliability to become operational with the armed forces. Research in nuclear

World Armies

fusion began in 1955, and a Soviet-built research reactor was installed at Inchass, a Cairo suburb, in 1961, but weapons research was never seriously pursued.

It was against this background of repeated failure to develop a sophisticated arms industry based on local resources that the basic AOI strategy of involving Western manufacturers in the upgrading of the Egyptian armaments industry was formulated. Its concrete results so far, apart from the agreement to produce 12,000 American Motors Corporation jeeps per year, have been an \$80,000,000 contract with British Aerospace in December, 1977 to set up a production line in the outskirts of Cairo to produce the Swingfire long-range anti-tank guided weapon, and a further set of contracts worth \$665,000,000 in early 1978 to build Lynx 10-seat military helicopters in Egypt. The Swingfire is being built by a joint company called Arab British Dynamics, with six AOI representatives on the board and a British managing director. Two similar companies, the Arab British Helicopter Company and the Arab British Engine Company, have been created in partnership with Westland Aircraft and Rolls Royce to build the Lynx helicopters and their Gem jet engines at the Helwan aircraft factory 18 miles outside Cairo. The first 20 helicopters are to be imported whole from Britain, the next thirty assembled locally from imported parts, and subsequent models to have increasingly large proportions of locally manufactured components — an eventual production rate of four per month is envisaged, with probable market of some 250 Lynxes eventually forecast in the various Arab armies.

The choice of a fixed-wing combat aircraft to be produced by AOI has been the subject of excessive speculation and repeated premature announcements, but at the time of writing it appears to have settled on the Franco-German Alpha Jet, a technically undemanding trainer/strike aircraft on which the Egyptian aircraft industry can build up its expertise. After almost 3 years of negotiation the AOI signed a contract with the French Marcel Dassault Aircraft Company in October, 1978 for the purchase of 14 Alpha Jets to be followed by the assembly of 150 more (again with increasing Egyptian input) at the Helwan aircraft manufacturing complex. This deal is reportedly linked with others to be concluded with SNECMA (the French aero-engine company), and with Matra (the missile manufacturing group) and the Thomson-CSF electronics groups to assemble Crotale surface-to-air missiles and to produce surveillance radars and communications equipment for AOI. The arrangement with Dassault also calls for the establishment of an assembly line in Egypt for the very advanced Mirage 2000 fighter as soon as it enters production in France, but since that is not scheduled to occur in France until 1982 it allows considerable time for Egyptian skills and manufacturing capabilities to be developed.

An element of doubt about the future status of the AOI has been introduced by the signature of the Egyptian-Israeli peace treaty, and was further exacerbated by President Sadat's dismissal of its chairman, Ashraf Marwan, in October, 1978, but it is unlikely that these events will lead to the collapse of the organisation. So long as the present regime survives, Egypt will continue to be seen as a safe home for their armaments industry by the conservative Arab States which are providing most of the money and much of the market, and the attractions of that market provide a sufficient incentive to Western arms manufacturers to enter into arrangements with AOI.

RANK, DRESS AND DISTINCTIONS

The titles of rank are the same in all four services, and equate to the same levels of base pay and privileges. Like the uniforms, unit insignia and much else, they derive from British models, and are shown with their corresponding British army ranks.

<i>Egyptian rank</i>	<i>British army equivalent</i>	<i>Insignia*</i>
Mushir	Field Marshal	Eagle, wreath, crossed swords
Fariq Awwal	General	Eagle, two stars, crossed scimitars
Fariq	Lieutenant-general	Eagle, one star, crossed scimitars
Liwa'	Major-general	Eagle, crossed scimitars
'Amid	Brigadier	Eagle and three stars
'Aqid	Colonel	Eagle and two stars
Muqaddim	Lieutenant-colonel	Eagle and one star
Ra'id	Major	Eagle
Naqib	Captain	Three stars
Mulazim Awwal	Lieutenant	Two stars
Mulazim	Second-lieutenant	One star
Musa'id	Warrant Officer	Epaulettes without insignia, triangle on right sleeve
Raqib Awwal	Sergeant-major	Four stripes on right sleeve
Raqib	Sergeant	Three stripes
'Arif	Corporal	Two stripes
Jundi	Private	One stripe

* Officers wear their insignia on epaulettes; other ranks on sleeves.

Officers and men of the various branches of the army (engineers, infantry, armour, etc.) and of the navy (seamen, communications, weapons, etc.) wear distinctive insignia on their sleeves. Men serving in specialist units such as the paratroops or commandos wear various badges denoting their expertise and experience. Air force personnel do not wear branch insignia, but flying personnel wear badges on the left breast — the national ensign with a wing on either side for pilots, on one side only for navigators and observers.

Pay and allowances for both officers and enlisted men are good by comparison with what individuals of comparable skills could expect to receive in the civilian economy, and there is specialist pay and hazardous-duty pay in addition for dangerous assignments such as flying, submarine duty and commando service. Rapid inflation has narrowed the gap between military and civilian pay in real terms in recent years, and there may even have been a slight fall in more junior officers' real income, but there remain the considerable advantages for all servicemen of relatively generous leave, decent medical care and educational opportunities, plus the cash benefits of pensions, longevity pay, family allowances and care for servicemen's families which are generally unavailable or very limited in civil life. Officers' social status remains high, and ordinary servicemen are highly regarded by the public as patriots doing a difficult job.

Officers and NCOs have separate accommodations, and married quarters exist in most garrison posts for regular troops. Unmarried enlisted men and conscripts live in barracks. Food is ample and good, often superior to that consumed by the average civilian. Discipline is strict, even harsh, but is recognised to be administered fairly. The class-ridden officer-man relations of the old Egyptian army have been largely eradicated.

Egyptian uniforms generally follow the British pattern in all services, though naturally with the emphasis on light-weight clothing. The army's service and dress uniforms are closely similar to British army models, but both functional clothing (for tank crews and other specialists) and combat dress are now based mainly on Soviet patterns. The navy wears white uniforms most of the time, but does have dark blue uniforms for winter use. The air force usually wears khaki uniforms with light-blue garrison or service caps; officers generally wear a 'bush jacket' with the sleeves rolled up.

The system of awards and distinctions was radically revised at the time of the Revolution, eliminating all distinctions with a royal connotation, and was codified in its present form in 1966. All major distinctions carry with them a monthly cash bonus ranging from £E10 to £E2.50 which is payable throughout the individual's service career and is subsequently added to his (or his family's) pension.

The highest decoration is the Star of Honour; it is worn by the President of the Republic, and is awarded to officers for 'exceptional service, sacrifice and extreme prowess in the face of the enemy'. In addition to the cash bonus, it carries with it the guarantee of free education at all levels for the holder's brothers and children.

The other major decorations in order of precedence are the Military Star and the Military Medal of the Republic (gold and silver classes), which are awarded, respectively, to officers and men for courage on the battlefield; and the Medal of Courage and the Military Medal of Duty (each in gold, silver and bronze classes), which are granted to officers and men for 'distinguished acts of bravery' and for 'loyalty, devotion to duty and good conduct', respectively. There is another group of awards that are awarded for outstanding service or for participation in particular events or campaigns.

CURRENT DEVELOPMENTS

The recent accusation by General Saadeddin al-Shazli, former Egyptian Chief-of-Staff and architect of the 1973 crossing of the Suez Canal, that President Sadat's policies have lowered the Egyptian armed forces' capabilities to only 60% of what they were on the eve of the 1973 war is substantially correct. It confirms a 1978 estimate by the United States Defense Department that Israel would be capable of smashing any combination of Arab military forces brought against her within two or three weeks for at least the next 5 years.

The effective disappearance of any Egyptian offensive capability against Israel, and indeed the probability that even Egypt's ability to defend itself against an Israeli attack has gravely deteriorated, is the quite inevitable consequence of Sadat's political strategy. It was clear from the beginning that the Soviet Union, Egypt's sole source of arms from 1955 to 1973, would not continue to supply weapons once Sadat embarked on his 'American strategy' for reaching a peace settlement with Israel (though the completeness and devastating effect of the Soviet embargo on spare parts may not have been anticipated).

It was equally clear that Western arms suppliers could not quickly fill the gap, both because Egypt's financial resources and the ability of its armed forces to change over quickly to Western armaments would not permit it, and because the USA in particular would be reluctant to supply Cairo with large quantities of advanced weapons so long as any possibility of an Egyptian-Israeli military conflict lingered on.

In effect, therefore, the decline of Egyptian military capabilities against Israel was foreseen and discounted in advance, as being of little political significance in a situation where peace with Israel was the goal of Egyptian policy. It is now evident that Sadat reckoned not to have to deal with serious domestic popular opposition to peace with Israel, and that he was prepared if necessary to disregard the reactions of the rest of the Arab world, assuming that the 'radicals' would fulminate ineffectually while his conservative allies and financial supporters would eventually accept his policy lest worse befall (i.e. the re-emergence of a radical regime in Egypt). What could not be so easily discounted was the possible reaction of the

World Armies

armed forces, either on the political ground that their sacred mission was being betrayed, or on the professional ground that their organisation was being allowed to deteriorate.

It is possible that one reason for Sadat's gradual reorientation of the armed forces towards an interventionist role in the service of Western and 'moderate' interests in Africa (in addition to the obvious purposes of keeping radical and pro-Soviet regimes away from Egypt's borders, winning American support, and gratifying Saudi Arabia) was to provide the Egyptian officer corps with a new and professionally attractive role. The need for some such compensation was amply demonstrated by the mid-1978 defection of General Shazli, probably the officer who still commanded the highest respect in the Egyptian armed forces despite his previous well-publicised disagreements with Sadat's policies and his post of semi-exile as Ambassador to Lisbon.

The state of dissatisfaction prevailing in the Egyptian officer corps, which had already moved Sadat to promote the Air Force Commander Husni Mubarak to the Vice-Presidency in 1975 in an attempt to placate the armed forces, was certainly intensified after Sadat's November, 1977 visit to Jerusalem, when it became clear that he was determined to conclude a separate peace with Israel if efforts at a more comprehensive settlement failed. It is understood that about 130 officers were retired or transferred immediately before Sadat went to Israel, and armed forces senior officers' public statements in succeeding months did not always contain the usual fulsome and unstinting praise of the President.

The internal politics of the Egyptian armed forces are more than usually inaccessible to outside observers, but there has clearly been concern in the Egyptian government since late 1977 over the possibility of a coup. The political upheavals in Egypt during the brief experiment with 'democratisation' in spring 1977 to spring 1978, the fact that two of Sadat's own appointees resigned the Foreign Ministry within a year (unable to keep up with the rapid development of his peace offensive), and above all the alarming popular dissatisfaction with the state of the economy revealed by the January, 1977 food riots, all served to underline the critical degree to which Sadat's rule is dependent in the continued support of the armed forces. Nor did it pass unnoticed that very senior Saudi officials were having secret consultations with senior Egyptian officers, as though anxious to insure their huge financial and political investment in Egypt (\$3,000,000,000 of direct budgetary support in 1977) should Sadat's regime prove impossible to support further.

Moreover, while having to contend with this possibility of being supplanted with Saudi approval by some politically conservative senior officer, Sadat must also reckon with the continuing presence of large numbers of officers whose whole backgrounds and political training were Nasserist, and who are likely to be hostile to the present regime both on pan-Arab and socialist ideological grounds. Nasserist officers, indeed, still predominate in the politically sensitive Intelligence Branch and the internal security forces. It is therefore significant that a known Sadat loyalist, Major-General Fuad Aziz Ghali (who has the additional attraction of being a Coptic Christian and thus relatively inaccessible to Saudi influence) was appointed in June, 1978 as the new Director of the Organisation and Administration Department of the Army, which controls all transfers, promotions and appointments and functions in effect as the army's political commissariat. At the same time two other enthusiastic Sadat supporters, Major-General Hassan Sayyed and Major-General Hassan Tawfiq, were appointed to newly created posts as Assistants to the War Minister.

These moves were followed in October, 1978 by the dismissal of General Abdul Ghani Gamassi, who had been Deputy Prime Minister, Minister of War and Commander-in-Chief of the Armed Forces since 1973, but had been showing a noticeable lack of enthusiasm for Sadat's peace initiative and arms procurement programme, and the simultaneous removal of General Muhammad Ali Fahmi, the Armed Forces Chief-of-Staff and Commander of the Army. Both men were appointed 'military adviser to the President', and their executive posts were taken, respectively, by General Kamal Hassan Ali, the former Army Intelligence Chief, and by Major-General Ahmad Badawi. At the same time most civilian posts in the cabinet changed, and the title of Minister of War was altered to Minister of Defence to reflect the new orientation towards peace with Israel.

It is probable that President Sadat, an expert in the political management of the armed forces, will succeed in retaining the loyalty of Egyptian senior officers in key posts (or removing doubtful ones in time), and that the senior officers, aided by the very thorough penetration of all levels of the officer corps by the intelligence services, will keep control over the more junior ranks. The possibility of political unrest in the armed forces cannot be entirely discounted over the next few years, however, as it is certain that they will undergo further drastic changes of composition and role just as great as those they have experienced in the first 5 years after the 1973 war.

GWYNNE DYER

EQUATORIAL GUINEA

History and Introduction

Equatorial Guinea is the nation which was formed by the union of Spain's two former sub-Saharan African possessions into one independent State in 1968; the two possessions were Rio Muni, on the West African coast and the island of Fernando Po (now named Macias Nguema); certain small groups of islands also form part of the State. At independence a small Spanish *Guardia Civil* garrison remained, for external defence and internal security. In the February–April, 1969 political crisis, during which anti-white riots occurred, a new independence force, the *Guardia Nacional*, was instituted and the Spanish unit withdrawn.

Strength and Budget

Population: 290,000 approximately
Army: between 850 and 1000

Command and Constitutional Status

The Republic's Life President, President Macias Nguema, holds the post of Minister for Defence and Chief of the Armed Forces.

Role, Commitment, Deployment and Recent Operations

The role of the *Guardia* is essentially one of internal security, or armed political support for the President. Equatorial Guinea had a dispute with Gabon over certain off-shore islands; this was settled by the mediation of Congo and Zaïre in 1972.

Organisation

No information available.

Recruitment, Training and Reserves

The force has a high percentage of mainland Fang soldiers in its ranks; President Macias Nguema is himself a Fang. Reports state that soldiers of other ethnic groups, notably Bubi, are not issued with weapons and are used for duties such as driving and cooking. The Fang have never been popular in the islands. A few Spanish officers were reported to be still serving with the force in the mid-1970s but these are thought now to have departed. One report has noted a recent arrival of some 100 Cuban advisers.

In a recent statement the government announced that it proposed to introduce military training for boys aged seven to fourteen.

Equipment and Arms Induction

The force was equipped with Spanish small arms at independence, but it is likely that small quantities of Soviet or Chinese weapons may now have arrived.

Rank, Dress and Distinctions

These generally follow the Spanish system.

Current Developments

The *Guardia Nacional* exists primarily to support an authoritarian regime.

L. L. MATHEWS

ETHIOPIA

HISTORY AND INTRODUCTION

Ethiopians not only have an ancient military tradition but also a country which geographically is ideally suited to its exercise. An island of Christianity in an almost encircling sea of Islam, the mountain fastnesses of the Amhara peoples have over the centuries suffered attacks from Arab, Somali, British, Egyptian, Dervish and, more recently, Italian armies.

The cult of the hero is deep-rooted in Amhara society. The warrior who killed another man was traditionally venerated and it was never difficult for Negus, Ras or a lesser chieftain to raise a private army. These flourished until the mid-1940s and it was only slowly that the Emperors Tewodros II (1855–68), Yohannes IV (1872–89) and Menelik II (1889–1913), who by conquest greatly extended the Amhara and Shoan kingdoms to the east, south and west, introduced the concept of a national army. Menelik, in whose time massive arms imports began, had to stem the first serious wave of Italian aggression, and Adowa (1896) was the first big defeat of a colonial army by an African.

Haile Selassie became Regent in 1916 and Emperor in 1930, and was the real creator of the Ethiopian armed forces who were, ironically, to topple him in 1974. He formed the Imperial Bodyguard in 1917 and sent some young men to St. Cyr in the 1920s. Belgian, Russian, Swedish and Swiss officers helped institute training programmes and a school for officers was established at Holeta in 1934 — but too late to have much impact on Mussolini's invasion of October, 1935. Barefoot Ethiopian units, armed with spears and antique rifles, were routed, and although a patriotic resistance continued, the modern organisation of the army had to wait until Haile Selassie's return from exile with the Allied forces who overran the Italian East African Empire in 1941.

For 10 years the British Military Mission trained and equipped 10 infantry battalions, a regiment of artillery and one of armoured cars. In 1951, in line with the Truman Doctrine, the United States took over. In exchange for the use of Kagnew communications base in Eritrea, United States military aid began to pour in. The 1953 Mutual Defence Agreement set up the Military Assistance Advisory Group (MAAG) and United States equipment and weaponry became standard. Between the early 1950s and 1977 the United States was the primary supplier of military hardware and training.

Other nations played their part, however: Swedes helped set up an air force in 1947 and Norwegians a navy in 1955. The Israelis have trained paratroops, and Britain, France and India have also provided a modest amount of aid and training assistance. The Haile Selassie I Military Academy was launched on Sandhurst lines at Harar in 1958 and staffed by Indian army officers up to 1971. Until the early 1970s a succession of Ethiopian officer cadets came to RMA Sandhurst, and majors and the occasional lieutenant-colonel and naval lieutenant-commander to the Staff College, Camberley.

Ethiopian units fought for the United Nations with some distinction in Korea (1951–4) and with rather less in the Congo (1960–4). These units came from the Imperial Bodyguard, an over-privileged and somewhat pampered force which comprised 6000 of a 26,000-strong army, and was in 1960 radically purged as a result of the unsuccessful December coup in which it was deeply implicated.

The educated military *élite*, many of them trained abroad, others conversant with Western standards through their professional or social contacts, always showed some impatience to modernise their country, and despite the Emperor's policy of cementing their loyalty by regular grants of *gashas* of land, some ambivalence in their attitude towards him. Between 1960 and 1974 there were a number of plots and rumours of plots against the regime involving senior army officers, but all of them were defused (and the leaders usually executed) at an early stage. However it was the discontent of predominantly Holeta-trained junior officers and NCOs with their low rates of pay, the internal injustices within the army, and a despair at the seemingly interminable war against secessionist guerrillas in Eritrea which led to the Creeping Coup of 1974.

Ethiopia's army revolt began as a minor insurrection by a group of young army officers in Borana. Widespread mutinies led to governmental changes and the imprisonment and execution of notables. The Armed Forces Co-ordinating Committee (AFCC) was formed in April and seized control of the country in June. In September Haile Selassie was deposed, the AFCC became the Provisional Military Administrative Council, or *Derg*, and proceeded to rule the country with General Aman Andom, an Eritrean, as Head of State. In November General Aman, with 59 other top ministers and generals, was assassinated, and Brigadier-General Teferi Bante, Chairman of the *Derg*, took his place. He in his turn was assassinated in the February, 1977 pre-dawn coup, power devolving to the man who had since early 1974 dominated army, *Derg* and country — Lieutenant-Colonel Mengistu Haile Mariam.

The *Derg* originally consisted of about 120 junior officers and NCOs, but intra-*junta* disputes (based on ideological considerations and personal antagonisms) and assassinations of *Derg* members by anti-government urban guerrillas — mainly members of EPRP, the Marxist opposition group — have reduced it in number to about 40, of whom 15 comprise its inner circle. Of the original inner group of 15 only three — including Mengistu — are still alive. According to reports emanating from diplomatic sources in Addis Ababa in 1978, the ruling military *junta* also now includes a number of Soviet

and Cuban advisers. Since the 1974 revolution pro- and anti-government factions have settled differences with 'revolutionary violence' on the streets of the capital, and at the time of writing (February, 1979) a region of terror — with nightly murders of so-called 'counter-revolutionaries' by undisciplined urban defence militia men and soldiers — is the order of the day.

STRENGTH AND BUDGET

Population (1978 estimate): 29,560,000

Army: 60,000 (The Territorial Army, consisting in 1977 of some 8000 men, has now been incorporated in the army)

People's Militia: 85,000

Mobile emergency police force: 9000

GNP (1975 estimate): \$2,900,000,000

Defence budget (1976): \$103,400,000 (\$E 215,000,000) which was 21% of the whole budget and 3.45% of the GNP

COMMAND AND CONSTITUTIONAL STATUS

The army is controlled by the Marxist Provisional Military Administrative Council or *Derg*, whose leading figure in February, 1979 was the Head of State and Army Commander, Lieutenant-Colonel Mengistu Haile Mariam.

The *Derg* had in late 1976 been taking steps to begin a civilianisation of the government in response to pressure from the Marxist Ethiopian People's Revolutionary Party (EPRP), the army, students and the former Confederation of Ethiopian Labour Unions (CELU). To this end it set up the People's Provisional Political Office — later renamed the Provisional Office for Mass Organisational Affairs — under Dr Hailu Fida (by October, 1977 Hailu, previously principal policy adviser to Mengistu, had fallen out of favour and is believed to have been jailed and executed). But the shoot-out of February 3rd, 1977 in which the previous Head of State, Brigadier-General Teferi Bante, and six other leading members of the *Derg* were killed, has hindered these moves, and there have been no recent signs of an increase in civilian influence at the expense of the military. Lieutenant-Colonel Mengistu, who survived the affray, is known to be a hard-line militarist as was his close rival, the *Derg*'s First Vice-Chairman, Lieutenant-Colonel Atnafu Abate, until his execution in a bloody purge in November, 1977.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Since the early 1960s internal and external threats to two regions have done much to prescribe the role of the Ethiopian army.

The most intractable problem has been in the former Italian colony of Eritrea, where predominantly Muslim movements (but backed by Christian Eritreans) have sought to reverse its absorption by Haile Selassie into the Empire as the 14th province in November, 1962. A long-drawn-out campaign by the Eritrean Liberation Front (ELF) — founded in 1958 to demand autonomy for Eritrea — and the Popular Liberation Front (PLF) — an orthodox Marxist group which split from the ELF in 1969 — aided by various Arab States, has sapped the army's strength and morale. There have been mutinies and defections and the 2nd Division has had at least five commanders in the past 3 years.

Even in the Emperor's day it looked as if it was a struggle that could not be won militarily and his replacement in 1974 by General Aman Andom, himself an Eritrean, held out hopes of an end to the fighting and the concession of some measure of self-government to the province. General Aman's murder, however, showed that the *Derg*, and in particular its strongman, the then Major Mengistu, was determined on a military solution.

Various expedients have been tried since the ELF launched a major new attack against 2nd Division army positions in and around Asmara early in 1975: the *Derg*, in April and May, 1976 offered 'regional autonomy' for Eritrea, but at the same time pursued contradictory policies — a new, 5th Division (the *Nebalbal* or 'Flame' Division) was raised and part of it sent north, and the ill-fated mustering of a peasant army ('People's Militia') of 35,000 ended in disaster when it, too, marched north only to be scattered by guerrilla forces in Tigre. The attempt to defeat Eritrean secessionists with a huge peasant army of 150,000 in the summer of 1977 had little apparent effect until heavy armour and large numbers of regulars were brought in under the command of General Ivanovitch Petrov, who masterminded the Ogaden victory, in mid-1978.

Until about February, 1977 much of the guerrilla activity in the province was near the border with Sudan to the west of Gondar, but in July the Ethiopian forces suffered a major defeat when the city of Keren, on an important road junction 50 miles north-west of Asmara, was seized by Eritrean rebels after a four-day artillery bombardment. In August the strategically important town of Mandafara was also in the hands of guerrilla forces. This left only Massawa, Agordat, Barentu, Asmara, Assab and a few small garrisons in government hands although the first three of these were under siege at this stage. In the face of these reverses there was a determined stepping up of anti-insurgent operations by the Ethiopian army in towns which it held in Eritrea, but this achieved little except to send fresh waves of refugees fleeing into

World Armies

neighbouring Sudan, adding to the 150,000 Eritrean refugees already there. However the guerrillas suffered severe setbacks in mid-1978, when Ethiopian forces cut off in Asmara smashed their way out following a major troop and tank offensive to relieve the city. By September government forces had raised the sieges of Asmara and Massawa and captured more than 30 towns. In November the rebels suffered their last grave defeat when Keren was recaptured.

By September, 1977 Agordat had fallen to the rebels after one of the bloodiest battles of the war, Barentu had been almost starved into submission and all the other government-held towns — including the provincial capital of Asmara and Massawa — were encircled and could only be supplied from the air. In October guerrillas severed Asmara's last remaining lifeline to the sea at Massawa, and in mid-December Massawa itself was captured.

In the past, independent reports have suggested that in spite of heavy Eritrean losses (some 30,000 are estimated to have lost their lives and about 900,000 have been displaced) the nature of the terrain has minimised the possibility of an outright victory by government forces. But although the rebel armies held almost all the province after 3 years' intensification of the war of secession, the use of Cuban and Soviet forces have now transformed the situation. Authoritative sources have already confirmed earlier reports from Ethiopian defectors and prisoners that Soviet and Cuban pilots have flown MiG-21s in action against Eritrean forces. It is also almost certain that troops from Cuba, South Yemen (and probably several East European States) have taken part in ground operations against the rebels. Even the most conservative intelligence reports suggest that there are at least 1500 Soviet military personnel and 15,000 Cubans in Ethiopia — and these have been used by the *Derg* with increasing effect in 1978–9.

The second area of tension has been in the south-eastern desert lands of the Ogaden, claimed by Somalia. The Somali Republic has long pursued an irredentist policy towards the Ogaden province of Ethiopia by claiming that the area is populated by 500,000 Somali tribesmen. This territorial claim has been pursued by illegal but covertly supported Somali guerrilla action on both sides of the border which has led to several clashes between the Ethiopian and Somali regular forces. Just as the 2nd Division ('The Army of the North') has been tied down for many years in and around Asmara, so the 3rd Division ('The Army of the East') has long been based in Harar and deployed southwards in the Haud and the Ogaden whenever President Siyad Barre has made expansionist references to a 'Greater Somalia'.

In 1964 sporadic guerrilla action in the area flared up into a two-day war but both sides were forced to stop fighting when they ran into logistical problems. At a conference in March the two countries agreed to the establishment of a demilitarised border zone but minor skirmishes continued for another 12 years, and in 1976 the Liberation Front for Western Somalia swung into motion and briefly captured the town of Imi. By mid-1977 the guerrilla incursions were being heavily supported by Somali troops and weapons, and by November the Liberation Front for Western Somalia was in control of virtually the entire province with the exception of the cities of Harar and Diredawa. At the end of 1977 Somalia and Ethiopia were engaged in open military confrontation but the tide of battle began to turn in Ethiopia's favour when the army, heavily backed by Soviet and Cuban 'advisers', units of the 'peasant army' and vast supplies of Soviet military hardware, mounted a massive counter-offensive from the provincial capital of Harar at the beginning of 1978. On March 9th Somalia accepted defeat in the Ogaden by announcing withdrawal of its troops from Ethiopian territory but guerrilla activities in the province continue.

One eye is always kept cocked in the direction of Djibouti, formerly the French Territory of the Afars and the Issas, which received its independence on June 27th, 1977. If Ethiopia ever loses control of the ports of Massawa and Assab to an autonomous Eritrea, the rail link from Addis Ababa to Djibouti — which is the main outlet and point of entry for Ethiopia's trade — will assume even greater importance.

The Afars are an Ethiopian people while the Issas are a Somali clan. The constitution of Somalia includes claims to Djibouti but Addis Ababa is determined not to allow it to fall into Somali hands. Both countries are concerned about each other's intentions and rightly suspect each other of wanting to annex the tiny enclave. Somalia has provided aid for a small guerrilla group, the Front for the Liberation of the Somali Coast (FLCS) which was founded in 1960, while Ethiopia has given support to the Afar ex-premier of Djibouti, Ali Aref. But Ethiopia also faces a revolt among its own Afar population and is worried lest the Ethiopian Afars, led by Ali Mireh, should break away and form a new entity with Djibouti. Addis Ababa's railway link with Djibouti port has been closed for most of the 10 months since June, 1977 as a result of the repeated destruction of rail bridges by guerrillas of the Liberation Front for Western Somalia. Because of its dependence on Djibouti, Ethiopia would almost certainly regard any attempt by Mogadishu to annex the territory as a *casus belli*, but a deterrent to such a scenario exists in the shape of 4500 troops retained by the French in their former colony.

Relations between Addis Ababa and Khartoum have also been strained. Sudan harbours about 250,000 Ethiopian refugees — some of them officers and men from the 'Army of the North'. President Nimeiry has complained that the Ethiopian Marxists have tried to foment trouble in his country as a smokescreen to their own difficulties. If provoked further he could well step up aid to the Eritrean and Tigrean liberation movements (he already allows these groups to use Sudanese territory as a base camp) and to the right-wing Ethiopian Democratic Union (EDU), based in Khartoum. Formed by exiled senior army officers and officials of the Emperor, the EDU operates in the Gojjam and Begemdir provinces of north-western Ethiopia. Little has been heard of this royalist group since the fall of its strongholds at Humera and Metema to *Derg* forces in mid-1977.

Over the past 20 years the army has been called in to dampen internal unrest in Gojjam (where civil disturbances broke out in 1967–8), in Bale and Sidamo provinces (where the Somalia-based Oromo Liberation Front is active), and more recently in Addis Ababa itself (where in the face of random political violence from ultra-left and rightist groups it searches

houses, maintains the curfew and protects the members of the *Derg*).

All in all there are six identifiable rebel movements within Ethiopia demanding autonomy or independence, and a number of other minor armed groups fighting for the overthrow of the regime or a change in its ideological orientation — all of which require the attentions of the army. To complete Ethiopia's all-round discomfiture she shares long frontiers with two hostile neighbours, whilst not much further away parts of the Arab world are opposed either to her Marxism or her putative anti-Muslim stance in Eritrea. Any of these powers could, at the most, intervene (as Somalia has already shown), or at the least, continue to support rebel movements within Ethiopia.

ORGANISATION

Six notionally 8000-man divisions (each of three brigades) which includes the 5th (Flame) Division. Five artillery battalions, two engineer battalions, one airborne infantry battalion, one light infantry battalion (brigade). Seven tank squadrons and four armoured car squadrons.

The 2nd Division, now swollen to over 15,000 men, is with several other units in Eritrea, where it just about controls the provincial capital of Asmara (its HQ). The 3rd Division's HQ is at Harar, whilst those of the 1st and 4th Divisions are in Addis Ababa. The 4th has served generally in the southern provinces though some 5000 men were moved in 1975 to Eritrea to support the Asmara-based 2nd Division.

About one third of the Ethiopian army (some 20,000 troops) are presently committed to containing approximately 10,000 Eritrean rebels, and another third are tied down in an attempt to consolidate the eastern and south-eastern provinces after the recent (March, 1978) defeat of the Somalis. With the repulse of Somali forces and plans to concentrate even more forces to defeat Eritrean secessionists, troop movements during the remainder of 1979 are likely to be increasingly frequent. This analysis of the organisation and deployment of the army must therefore be regarded as highly tentative.

The 2500-strong air force remains based at Debra Zeit, near the capital, and the 1500-man navy in Massawa. A detachment of marines based at Dongollo between Massawa and Asmara was displaced by Eritrean guerrillas in 1977.

RECRUITMENT, TRAINING AND RESERVES

Service in the army has generally been voluntary and has always been popular since, as in many other African States, it is an avenue to social and economic advancement. The ancient martial tradition ensures that much local prestige attaches to a soldier's uniform. It has not therefore been difficult to build up one of the largest armies in Africa and the second largest (after Nigeria) in Black Africa.

Most of the officers in Haile Selassie's day were recruited from the landowning class. Many others moved into it when a grateful Emperor rewarded their loyalty by settling land on them (the *Derg*'s sweeping land reforms have now dispossessed them and caused much bitterness, especially in the Asmara-based 2nd Division). Some three-quarters of the parents of the intake at the former Haile Selassie I Military Academy, founded at Harar in 1958, owned land. In educational terms the post-war officer corps have formed a significant section of the social *élite*, representing an eighth of all Ethiopians who had been educated beyond the secondary level.

Officially the recruitment of officers and men has taken no account of their geographical or ethnic origin within the country. Nevertheless Amharas have preponderated in the officer corps (constituting about half of all officers) although they account for less than a quarter of the country's population. Tigreans, constituting a tenth of the population, account for a fifth of officers although their proportion was almost a quarter in 1970. The remaining 30% of officers have been drawn mainly from the Eritrea and Oromo (Galla) regions. Enlisted men have been recruited almost equally from the Amhara and Galla areas (35% each) and only 30% from elsewhere. Thus, as in many other African armies, there is a marked difference in the ethnic and regional base of the officer corps and the ranks.

In the late 1950s and early 1960s the best 12th-grade boys from the secondary schools were drafted into the army for life and most of them were happy to end up at Harar. These became regular officers, whereas the officer school at Holeta gave short-service commissions only. NCOs went there to gain commissions, too. Many of the current differences within the army stem from a developing Harar—Holeta animosity. The more traditionalist product of Harar shared little common ground with the upstart, potential revolutionaries of Holeta, who always regarded themselves as poor cousins and who are exemplified by the present Head of State, the ambitious, unattractive Lieutenant-Colonel Mengistu.

Reserves are probably entirely committed.

Recently there have been reports of inter-tribal antagonisms within the army, particularly between the Amharas and members of the Oromo ethnic group. This source of cleavage was illustrated in the clash between Mengistu, from the Walamo tribe (part of the larger Oromo ethnic group) and the ill-fated Lieutenant-Colonel Atafu Abate, a member of the Amhara tribe. A few months before his bloody execution in November, 1977 — perhaps anticipating what was to happen — Atafu Abate moved his headquarters into the compound of the 4th Division (which had a simple majority of Amharas), and seldom moved from there. Reliable reports indicate that since November, 1977 Lieutenant-Colonel Mengistu has been guarded by several hundred loyal Walamo soldiers, showing both the extent of ethnic tensions in the

World Armies

army and the Ethiopian strongman's fear of a coup.

By 1960 an air-force school was established at Debra Zeit (adjoining the air force base), and a naval cadet school at Massawa. These schools were expanded to become academies in 1968.

EQUIPMENT AND ARMS INDUSTRY

Until mid-1977 the army's equipment was almost wholly American. Between 1952 and 1976 the USA provided Ethiopia with \$275,000,000 in military assistance. This level of aid was larger than that of all her other donor governments together and four times that given by the USA to 13 other tropical African States.

Before the war with Somalia began in June, 1977 Ethiopia had 35 M-60 medium tanks, 70 M-41 light tanks, 90 M-113 APCs and 55 French AML-60 armoured cars, though the ELF has claimed to have knocked out many of these. Howitzers and mortars were at that time all of American pattern. The standard infantry combat rifle remains the M-1 carbine. Israel—fearful that Arab control of the Red Sea would threaten her vital oil lifeline—has continued to supply weapons to Ethiopia including air-to-air missiles, cluster bombs and probably napalm.

After 1975 U.S. military aid became somewhat attenuated: in March of that year only \$7,000,000 was forthcoming in response to the *Derg's* request for \$25,000,000 to stave off the secessionist threat in Eritrea. This marked the beginning of America's re-evaluation of its military aid programme to Ethiopia, but despite increasing internal anarchy and mounting left-wing extremism some aid continued for another 18 months. In April, 1976 eight F-5 fighter bombers were supplied. A year later in April, 1977 the *junta* expelled its American military advisers.

The Soviet Union quickly filled the military aid vacuum and in August, 1977 it began delivery of the equivalent of some \$385,000,000 in arms. Since mid-1977 deliveries from the USSR are believed to have included: 400 T-54/55 and a few T-62 tanks; 60 older T-34s; 200 other assorted armoured vehicles; more than 300 guns of various calibres from 100 mm to 152 mm; as well as mortars, anti-aircraft guns and several batteries of BM-21 rocket launchers. SAM-3 and SAM-7 missiles and Sagger anti-tank guided weapons have also been supplied, together with large quantities of small-arms ammunition, spare parts and communications equipment. Thirty American M-47 tanks have also been received from Yugoslavia. The air force, which had 35 combat aircraft in early 1977, has been supplemented by approximately 60 MiG-21s and a few of the older MiG-17s.

The USA continued to shore up a hostile Marxist State for almost 3 years after the 1974 coup because it was felt (quite rightly in view of subsequent developments) that if she did not the Soviet Union would fill the gap. Ethiopia continued to ask for American aid because if it dried up she feared there would be a dangerous hiatus during which she would have an acute short-term rearmament and retraining problem. As it was the Ethiopian army experienced considerable difficulties in the handling and operation of its newly acquired Soviet equipment during the last few months of 1977 and the first quarter of 1978 when the massive airlift of Soviet arms to Ethiopia took place. However the dislocations were not as severe as expected and the military has largely adjusted to the switch in the source of arms.

In 1951 Haile Selassie established a small munitions factory in Addis Ababa, but apart from this, all Ethiopia's military hardware has been imported.

RANK, DRESS AND DISTINCTIONS

Ranks are after the British style, dress is American. Officers of the *Derg* are now seen in No. 3 dress of tan khaki long-sleeved shirts and trousers, cherry-coloured chokers, black webbing belts (like the British 1937 pattern) and green U.S. army overseas caps (sidehats). A black aiguillette is worn on the left shoulder by senior officers, and badges of rank appear on the open-necked shirt collar.

CURRENT DEVELOPMENTS

The outlook for the Ethiopian army today is still grave though the situation appeared even more dire in the face of apparently imminent defeat at the hands of the Somalis in the Ogaden during the latter months of 1977. At one time it seemed as though the whole country might fragment into a series of petty States, but this has not in fact occurred. The army's control over the remoter regions is tenuous, especially in the north and east. Lieutenant-Colonel Mengistu has admitted that there is rebellion in eight of the 14 provinces.

The size of the army increased by almost 50% between 1976 and 1978, but after all the purges and defections since the 1974 coup the quality of the training and leadership of any new units must be doubted. The 5th (Flame) Division seems to be, partly at least, a sort of Praetorian Guard to protect the *Derg* and the Head of State from assassination attempts, of which there have already been many.

The morale of officers and men is low and their loyalty to the *Derg*, which seems to have degenerated into a kind of Marxist Mafia with its occasional Valentine's Day massacres, must be at the least questionable. There have been rumours of

conspiracies against the ruling military *junta* from elements of the 4th Division, as well as numerous demonstrations of disaffection and mutiny from front line army units serving in Eritrea and the Ogaden. There has been particular anxiety about the loyalty of the Harar-based 3rd Division (in October, 1977 some of its units mutinied and retreated in disorder from the fighting at Jijiga) and there have been persistent reports of regulars being forced into battle only through the persuasion of militia units. This mood of disenchantment with the regime has been largely responsible for Ethiopia's poor performance on its two main battlefronts and explains why Mengistu has had to lean so heavily on his Soviet and Cuban 'advisers' for support in both the administration of the country and trying to eradicate the guerrilla insurgency in Eritrea and elsewhere.

Equipment, weapons and ammunition which were running short due to the cutback and eventual suspension of American military aid are now being provided by the USSR, but the *Derg* will find it increasingly difficult to disentangle itself from the wider political ambitions of its new communist allies. The future of Ethiopia and its army remains bleak: unfortunately the country is too strategically important to be left to determine its own future. Ethiopia is seen to affect the entire balance of power in the Horn of Africa and to weigh heavily in the world political conflict between East and West. For a long time to come the fortunes of the army, and its relationship with the civilian population as a whole, will be inextricably tied up with the activities of rebel guerrillas, the designs of Ethiopia's neighbours and the interests of the wider international community.

FIJI

Fiji is the largest country by far amongst the South Pacific island States, with an area of 7055 square miles and a population of about 560,000 people living on 106 inhabited islands, of which the two largest islands, Viti Levu and Vanua Levu, account for over six-sevenths of the national territory. The army was established under the Fiji Military Ordinance, 1949, and passed under national control when Fiji achieved independence within the British Commonwealth on October 10th, 1970.

The Fiji islands were first settled by Melanesian colonists, and already contained a long-established population, divided into many warring tribes, when they were first sighted by Europeans in 1643. European visitors became numerous in the nineteenth century, when sandalwood from Fiji became a valuable export commodity, and the usual consequences ensued. The principal gifts of European sailors to the islands were rum, muskets and syphilis, and in the latter part of the nineteenth century the islands were ravaged by disease and constant, bloody tribal wars. They were taken into the British Empire in 1874, and were gradually reduced to order.

The British attempt to develop sugar-cane cultivation in the islands, however, was directly responsible for the principal political problem which faces Fiji today — and one in which the army and police are potentially significant. Native Fijians proved unwilling to engage in the brutal physical labour involved in growing sugar, so around the turn of the century the British began to introduce Indian labourers into the islands. Over the next four decades approximately 60,000 Indian immigrants arrived, and their descendents today account for 51% of the population. Native Fijians of Melanesian origin are only 42%, the remainder of the population being small European, Eurasian and Chinese minorities.

Almost all of Fiji's exportable commodities except gold are agricultural — primarily sugar, copra and ginger — and the vast majority of farmers are of Indian origin. Indians also have a dominant position in commerce and the professions. This causes a certain resentment amongst the Fijians who have become a minority in their own country, but it scarcely compares with the resentment felt by the Indian community against its legal disabilities. These revolve mainly around the ownership of land, which has a great spiritual significance for Fijians (even if they are not inclined to farm it).

To safeguard Fijian hereditary land, the constitution prevents non-Fijians from acquiring it. This means in practice that 90% of agricultural land is owned by Fijian nobles or communally by Fijian villagers, but that most of it is actually worked by Indian tenant farmers who are forbidden by law from acquiring leases of more than 30 years. This is the most important instance — though far from the only one — of what Indians see as systematic discrimination against them on behalf of the less-competitive native Fijians. (Another recently revealed case which caused a considerable outcry was the revelation that Fijians were being deliberately favoured over Indians in admission to the University of the South Pacific.) After four or even five generations in Fiji, Indians feel themselves still to be treated as second-class citizens.

The tension engendered by this rose sharply as a consequence of the two elections of 1977. For the previous 10 years, since before independence, Fiji had been governed by the Alliance Party of Prime Minister Ratu Sir Kamisese Mara, a nominally multiracial party which supports the present laws granting indigenous Fijians various special advantages. It naturally received most of the votes of these Fijians, but also garnered some support from Indians and minority races who felt that this was the safest course. Since the electoral system provides for a number of communal seats for which voters are segregated into separate racial electoral rolls, and the indigenous Fijian population has a disproportionate share of these seats, the Alliance Party invariably succeeded in gaining a majority in Parliament.

In the April, 1977 elections, however, a new, explicitly racist party known as the Fijian National Party emerged, which campaigned on the slogan 'Fiji for the Fijians' and advocated the deportation of the Indians in the population. This party succeeded in splitting the Fijian vote, and in driving enough Indians back into the arms of their own communal party, the National Federation Party (which seeks to end the ban on the sale of land to non-Fijians), that it caused the defeat of the Alliance Party.

Divisions within the victorious National Federation Party permitted Prime Minister Ratu Mara to retain office and call new elections. These were held in September, 1977 with Sakeasi Butadokra, the leader of the breakaway Fijian National Party, in jail for prejudicing the public peace. The elections resulted in a landslide victory for the Alliance Party, to which many of the defecting Fijian voters had returned, alarmed that their defection had almost brought the Indian communal party to power. The Alliance Party again forms the government, and all is superficially as it was before, but there is now a greatly heightened tension and concern about inter-communal relations in Fiji.

The Royal Fijian Military Forces (RFMF) are overwhelmingly Fijian in membership both in the regular force and the reserves, although there is no barrier to the entry of Indian or minority citizens to either the enlisted ranks or the officer corps. The first line of defence in internal security matters, the Fijian Police Force, is also predominantly Fijian, but it does have about 30% Indian personnel.

The Fijian army consists of one regular infantry battalion (with a strength of about 700 men), one Conservation Corps battalion and one Territorial (reserve) battalion. The force is not equipped with heavy weapons. There is also a naval

squadron, consisting principally of three converted minesweepers which are employed as fisheries protection vessels to enforce Fiji's newly declared 200 mile maritime economic zone. All form part of the RFMF.

The regular force of the army is recruited entirely by volunteer enlistment for long engagements. Enlisted men are trained primarily in New Zealand; officer training is done in Britain at the Royal Military Academy Sandhurst, or at the Australian Military College. These arrangements allow not only for basic and initial training in a military environment of greater sophistication than Fiji, but also extend to the provision to the RFMF of higher technical and professional training for its officers and men.

The Conservation Corps is primarily a means of relieving unemployment and upgrading rural skills, although it does provide military training as well. Those who serve in it, for periods of 6 months to 1 year, work at such tasks as road-building or the maintenance of public buildings, while receiving instruction in useful skills such as carpentry or machinery operation. Most members of the Conservation Corps and discharged regulars pass directly into the Territorials, a reserve force which is organisationally a single battalion, but which has many more members than normal for such a unit. Reservists may be called up for training, or permitted to volunteer for periods of continuous service: of the 500 man Fijian unit now serving with the UNIFIL peacekeeping force in Lebanon only 200 are regulars, the remaining 300 being Territorials who have taken the opportunity and volunteered.

Ranks and badges of rank within the RFMF are similar to those in Britain. The usual uniform is green-khaki shirts and shorts or long trousers.

The Fiji Police Force, with an authorised strength of 752 men, bears primary responsibility for internal security. It is a centralised force organised on the British model, with its own training school at Nasese (near Suva, the capital). In normal circumstances Fijian police do not carry arms on duty. Fijian members of the force wear blue shirts, white *sulus*, red cummerbunds and sandals; Indian members wear blue caps, shirts, trousers, and black shoes.

There have been few overt racial incidents in Fiji despite the recent rise in political tension. The composition of the armed forces and police, although not consciously designed for this purpose, contributes considerably to this relatively stable situation by ensuring that the racial minority has a majority within the security forces.

GWYNNE DYER

FINLAND

HISTORY AND INTRODUCTION

Finland's army occupies a very special place in national history and society, having been the instrument of the State's creation in 1918 — in admittedly controversial circumstances — and the embodiment of the popular will in the epic 'winter war' against the Soviet Union in 1939–40.

The Finns, a people of mysterious origin, neither Slav nor Teutonic, speaking a language apparently akin to Magyar, were conquered and christianised by their Swedish neighbours in the twelfth century. Conquest did not lead to subjection: when Sweden's moment of empire came in the seventeenth century, Finland provided her army with homogeneous regiments of infantry and cavalry, whose exploits at Breitenfeld and Lützen still arouse pride, and with individual recruits sufficient to make Gustavus Adolphus's army one-third Finnish. Out of the leaders of these fighting Finns was to grow a Swedish-speaking native nobility whose oppressiveness was remarkable even among the warrior societies of the Baltic regions. They were also remarkably successful in fending off the series of invasions which, as Swedish power declined, Russia launched across the Finnish border. But at the beginning of the nineteenth century this nobility, deciding its interests would be better protected by Russian than Swedish suzerainty, offered their country to the Tzar and, despite bitter military resistance to his armies by the Finnish rank-and-file (1808–9), managed to deliver it to him. The bargain they drove was, nevertheless, broadly advantageous to Finland as a whole, for the Grand Duchy, while retaining its legislative and fiscal autonomy, was henceforth assured of Russian military protection, without corresponding military liability, since the Finns were specifically exempted from conscription. For much of the nineteenth century indeed, while the country prospered and national self-awareness grew, Finland supported no military force at all, except a battalion of regular guardsmen for whom the Tzar paid; though, at the same time, the Swedish-speaking nobility, for whose sons a cadet school had been founded at Hamina (Frederickshamn) in 1821, furnished the Tzar, as did the rest of his Baltic aristocracy, with a sizeable proportion of his officers.

Finland's enjoyment of the best of both worlds, political and military, was to attract at the end of the century the hostility of the ascendant 'Russifiers' in the Tzar's government, who saw in the privileged military status of the Grand Duchy's citizens the making of an issue which could be used towards an overall reduction of its resented autonomy. Since 1878, when Alexander II had given back to Finland a national militia — one plank in his policy of offsetting a passing desire for reunification with Sweden by fostering local patriotism — all young Finns had been liable to short-term conscription within Finland, under Finnish officers. In 1898 the Russifiers tried to assimilate this liability to the Imperial norm: 4 years' service in Russian regiments anywhere in the empire. Recognising the thin end of a wedge, the Finnish Diet protested and was stripped by edict of its powers. Passive resistance within Finland prevented the imposition of the Imperial conscription law — though not the dissolution of the Militia, the cadet school and, in 1905, the Guards Battalion — long enough for the policy of the Russifiers to be defeated by the 1905 Revolution; and a well-timed general strike, organised by the large, new, tough-minded Social Democratic Party and policed by its own Red Guard (whose bourgeois student counterpart was called the White Guard), then procured the restoration of the Diet with an enlarged authority and on an extended franchise. But the military consequences for Russia, reinforced by a second attempt at Russification from 1909, was that few Finns were willing to fight for the Tzar when war came in 1914. On the contrary: Finland's principal contribution of manpower was made to the other side, the numbers of young Finns (many of them ex-White Guards) who 'patriotically' emigrated to Germany at the outbreak allowing the Kaiser to authorise, in May, 1915, the formation of the 27th 'Prussian' *Jäger* Battalion which was wholly Finnish in composition. It was briefly engaged on the eastern front but, its members seeing themselves as soldiers of an 'army in exile' whose foremost duty was to preserve it intact against the day of national opportunity, secured its permanent withdrawal to barracks in December, 1916. When that day dawned in the aftermath of the February Revolution, these *Jägers* were to play a decisive role, for the presiding power in Finland, the Social Democrats, then proved unable to organise the smooth transition from the status of Russian autonomous province to that, desired by all classes and parties, of a truly independent State. By losing control of their own Red Guards, whose insolent behaviour throughout the summer of 1917 alarmed both peasants and middle classes, they gave the covert White Guard organisation (which had kept itself in existence throughout the years since 1905 under the guise of athletic clubs and volunteer fire brigades) the pretext it needed to seek arms from abroad. By losing the critical election of October, 1917 it surrendered power to a collection of right-wing parties which the working class, rightly or wrongly, associated with the White Guard and social repression: thus also giving Bolshevik Russia a pretext for renewed intervention in Finnish affairs. For though the Bolsheviks were the first government to recognise Finnish independence, proclaimed by the new Diet in December, 1917, they were not really prepared to see a politically hostile and potentially pro-German regime established so close to home. When, therefore, in January, 1918 the Red Guards seized Helsinki and proclaimed a Socialist Workers' Republic, Lenin at once made available to them arms, personnel and advice.

The Red Guards did not take the need for Russian help seriously, for they had thought their *coup d'état* would secure them in power. What it provoked nevertheless, was a civil war in which, despite considerable Russian assistance, they were soundly beaten. What beat them was the arrival of the *Jägers*, a better force than any they could muster, the White Guards, and the remarkable military leadership of Mannerheim — eventually reinforced by plentiful German assistance. But Mannerheim's role was crucial. The most illustrious of the Tzar's many Finnish Officers, like most of them a sibling of the Swedish-speaking nobility, he had escaped from the Bolsheviks just in time to be offered command of the White forces, which he at once directed against the northern capital of the Reds, Tampere. Despite inferiority of numbers, he succeeded in capturing it on April 5th, after a siege of several weeks, and then, leading his still half-organised force southwards, sandwiched the remainder of the Red Army between it and the advancing Germans, the Baltic Division of von der Goltz, which had landed at Hanko on April 3rd. By the middle of May, Helsinki was in Mannerheim's hands and the civil war over. Mannerheim's part was still not played out, however, for it was he who persuaded his fellow Whites that they must not, as many wished, make their new state a puppet of Germany and insisted on the preservation of a strong army as a guarantee against that outcome. On the collapse of Germany, and the fall of the pro-German party, he briefly became Head of State.

The wounds of the civil war were slow to heal in Finland: over 24,000 Finns had died, 10,000 of them Reds who had succumbed to starvation or atrocity at White hands, and a smaller number of Whites who were the victims of Red atrocity. Finland was also not to make her peace with Russia until October, 1920 when most of Carelia, Finland's easternmost province, was ceded to the Soviets (but the Arctic port of Petsamo allotted to Finland). In the era of reconstruction which followed, military priorities naturally receded in importance, but conscription was re-established on the 1878 pattern and a typical small-nation conscript army slowly created. In 1932, legislation prescribed that all able-bodied Finns should spend their twenty-second year under arms and thereafter serve in the reserve until the age of forty. The regular component was limited to officers, NCOs and instructors, and the permanent institutions to a cadet school (1919), Reserve Officer School (1919) and War College (1924). An unusual feature of Finland's military structure was provided, however, by the *Suojeluskunta* (Civic Guard), which bears comparison with the contemporary Austrian *Heimwehr*. It was 100,000 strong and separate from the reserve (though most of its numbers were reservists), voluntary in character, yet recognised by the State. It was nothing more nor less than the White Guard, which remained in being as a standing check on the militant Social Democratic organisations; considerable hostility existed between the two. Trade unions, for example, refused to accept Civic Guards as members. The Guard also had a numerous Women's branch, called *Lotta Svärd*, after a Finnish literary heroine.

All these service-people were to be needed — and dissensions were forgotten — when, in November, 1939 Russia declared war on Finland by ultimatum. The Russians undoubtedly expected to get what they wanted — part of Carelia and the Hanko peninsula — without opposition. To their great embarrassment, the tiny Finnish army of nine divisions, about 135,000 strong, inflicted on them a whole series of defeats and it was only after 3 months of fighting on a static line that the Red Army was eventually able to break through. The Finns' highly individualistic *motti* tactics (small ski-unit infiltration of the forests) had again frustrated Russia's policy towards Finland; Finnish national pride, which had fuelled the success of their army, was no whit diminished by the annexations upon which Russia insisted. As soon, however, as Hitler declared war on Russia, the Finns took their opportunity to win back from the Soviets the ground they had been forced to surrender, and, to demonstrate their independence of the Germans, they thereafter maintained only a token offensive against the Russians, with whom, their sense of history told them, they must one day come to an accommodation.

The accommodation, arrived at by the armistice of September, 1944, itself brought about by a shattering Soviet counter-offensive, gave back to Russia both the disputed territories of 1939 and the Arctic part of Petsamo. It also imposed upward limits, codified by the Paris Peace Treaty of February 10th, 1947 on the size of the Finnish armed forces, which was henceforward to contain only 34,400 soldiers including frontier guards and anti-aircraft gunners, 4500 sailors with no more than 10,000 tons of shipping, and 3000 airmen with no more than 60 aircraft, none of them bombers. But that Finland still possesses not only an independent armed force, but also the bulk of her national territory and her undiminished sovereignty, is in part testimony to the respect in which Russia holds the military ability of her people and her army. It is usual for foreigners to think of the Finns as pioneers of social welfare and political democracy; their fundamentally martial spirit and history, one of the most remarkable in Europe, should also be remembered.

STRENGTH AND BUDGET

Population: 4,170,000
 Army: 34,400 and 4000 frontier guards
 Reserves: 690,000
 GNP (1977): \$32,400,000,000
 Military expenditure (1977): \$426,000,000

The strength of the navy is 2500 (two frigates, 25 smaller craft) and of the air force 3000 (48 combat aircraft).

World Armies

COMMAND AND CONSTITUTIONAL STATUS

Command of the Finnish Armed Forces is vested in the President of the Republic (who is himself indirectly elected by an electoral college). He is also responsible for Finland's foreign policy. He may in time of war delegate his military authority. Parliamentary control of the forces and their budget is exercised through the Minister of Defence, who is the administrative authority; his executive agency is the Ministry of Defence. Military command is in the hands of the Commander-in-Chief of the Defence Forces, a serving officer seconded from General Headquarters, the supreme command of the army. The army has its own Chief of General Headquarters and Chief of Staff. (The navy and air force have their own Chiefs and Staffs, subordinate to the Commander-in-Chief of the Defence Forces.) Finland may therefore be said to have a unified defence command structure in which, as is historically understandable, the army is paramount.

Three international treaties impose certain limitations and obligations on the role of the Finnish Armed Forces:

1. The Agreement of Friendship, Co-Operation and Mutual Assistance with Soviet Russia, signed 1948, obliges Finland to use all her forces against aggression directed at the Soviet Union through Finnish territory.
2. The Paris Peace Treaty between Finland, Soviet Russia, Great Britain and other States, signed 1947, limits the size of the armed forces to 41,900 and prescribes the existence of paramilitary forces (such as the Civic Guard and *Lotta, q.v.*).
3. The Agreement with Sweden over the Swedish-speaking Åland islands, signed 1929 and 1940, demilitarises those islands and exempts their inhabitants from military service but obliges Finland to provide for their defence.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

Because of Finland's neutrality, reinforced by that of her neighbour Sweden, and her special relationship with Russia, the role of her army is strictly limited. A bill currently under preparation for parliament defines these limitations: it recognises that the standing army cannot do more than offer a resistance at the frontiers if aggression is threatened, being specifically forbidden, by international treaty, from operating outside its own frontiers. But the very large reserves, which include almost the whole male population between twenty-two and sixty, are looked to as a means of defending the nation, its legal system and the circumstances of its people. If Finland, therefore, were threatened with large-scale invasions, the standing army would deploy and control the nation's strength in an effort to resist it, as it did in 1940. It is the existence of these reserves, together with Finland's formidable military record, which lends credibility to her reserve forces.

A subsidiary role of the army is to promote the peoples' willingness to defend their country and their physical fitness. This highly traditionalist view of the army as a 'School of the Nation' is very much in the spirit of the national character. An additional role which the Finns, together with other Scandinavians, have taken up since 1945, is that of providing international peace-keeping forces to the United Nations.

Commitment

Two Finnish battalions and several individual observers are serving at present under UN auspices: 'Finbatt' in Cyprus and a second emergency battalion in Suez. 'Finbatt' is not subordinated to the Finnish army but directly to the Ministry of Defence, and personnel volunteer to it; several of its officers are on the retired list. There are other Finnish servicemen and units also who belong to the 'Nordic Stand-by Forces in United Nations' Service' set up by Sweden, Finland, Denmark and Norway in 1964 to provide the UN with a readily available source of peace-keepers.

The remainder of Finland's army is committed in the normal way to the national defence.

Deployment

Finland is divided into seven military areas. Each area contains a brigade, and some also additional units: Armoured Brigade (HQ Parola), Nylands Brigade (HQ Dragsvik; the language of the brigade is Swedish), Pohjan Brigade (HQ Oulu), Kainuun Brigade (HQ Kajaani), Porin Brigade (HQ Säskylä), Karjalan Brigade (HQ Kouvola) and Savon Brigade (HQ Mikkeli). There is also a guard battalion at Helsinki, and light infantry battalions in Hame, Pojois-Karjala, Kymi, Nyland and Lappi (Lappland).

These control the operational forces, which also train the conscripts. Military Training Institutes, to which most of the remaining personnel are allotted, are subordinate directly to General Headquarters.

Recent Operations

Apart from duties with the UN already mentioned, Finland has not taken part in any operations since World War II.

ORGANISATION

Arms of Service

The army is divided into infantry, field artillery, coast artillery, anti-aircraft artillery, engineers, signals and logistic troops (which include medical services). The armoured units belong to the infantry; coastal artillery works in direct liaison with the navy. The Frontier Guards, a paramilitary force, are normally under the control of the Interior Ministry, and anti-aircraft artillery works in direct liaison with the air force.

Operational Organisation

Operational organisation and territorial location of the army is combined in Finland. The country is organised into seven military areas, each of which contains a brigade (one of which is an armoured brigade). The establishment of each of these brigades is: two infantry battalions; one artillery battalion of one field and one air-defence battery; one engineer company; one signal company; and one training battalion (third infantry battalion on mobilisation).

The five largest military areas each has a military hospital and a military transport company.

There are in addition six independent infantry battalions which, like the Lapland *Jäger* Battalion, are assigned either to regions of particularly difficult terrain or to liaison with the coastal artillery.

Frontier Guards

The Frontier Guards, numbering 3700, are a paramilitary constabulary which acts in peace-time as a border-security force and coastguard; it is trained in guerrilla tactics for war. Conscripts may perform their military service in major Frontier Guard units, of which there are seven: four land units in the four northern, western and eastern military areas, and three coastguard units in the three southern coastal military areas. Officers and NCOs are recruited and trained in the same way as for the army, but receive special-to-arm instruction at the Frontier Guard schools. Conscript training is designed to provide reserves for guerrilla forces which the Frontier Guards would activate in wartime.

Within the areas in which they operate — the thinly populated borders and the Baltic archipelago — the Frontier Guards exercise police powers and work closely with the civil police.

RECRUITMENT, TRAINING AND RESERVES

Recruitment

All Finns, if fit, are liable for military service and enter training at the age of twenty or twenty-one. The length of service is 240 days, after which conscripts pass to the reserve, in which they remain to the age of fifty. As reservists they are liable for 40 days' refresher training in 7–10 day periods (if NCOs or technicians, for 75 days). Those selected for technical training, as reserve NCOs, or as reserve officers, serve 330 days; reserve officers are liable, after conscript duty, for 100 days' refresher training and remain in the reserves until sixty.

Regular officers and NCOs (there are virtually no regular private soldiers) enter as conscripts and then transfer either to the Officer Corps (Lieutenant to General) or to the partially coterminous NCO Corps (Staff-Sergeant to senior Lieutenant).

Training

NCOs are trained at the NCO Institute in three successive 6 month courses, the last of which promotes successful candidates to lieutenant's rank. Would-be regular officers, having completed the Reserve Officer School course, go to the Military Academy for 2½ years; candidates must possess the Finnish School matriculation certificate. During the last year, cadets attend their arms school. After 4 years' service as a lieutenant, an officer does an 8–10 month captain's course in his arm school, and sits the captain's promotion examination.

Successful candidates may then sit the examination for the tri-service War College course, which leads to general staff posts via another competitive examination. The course is of 2 years for general staff and 3 years for technical officers. It also provides courses for civil servants who occupy defence-related posts.

Officers not successful in the War College examination are usually later trained at a senior officer's course which qualifies them for promotion to lieutenant-colonel.

Conscripts, of whom an annual total of 40,000 are inducted three times a year (February, June and October) are trained for 8–10 weeks, generally in the units in which they will serve. Besides the acquisition of special-to-arm skills, there is a high emphasis on developing their will to defend the country, their physical fitness and their ability to move and survive in the country's difficult terrain and extreme climate. All infantry recruits are trained in orienteering (individual cross-country running off a map and against the clock).

World Armies

Each arm of the service has at least one school or institute:

Infantry: Combat School, Parachute School

Artillery: Artillery School (ranges at Rovaniemi, northern Finland), Coastal Artillery School, Anti-Aircraft School

Engineers: Engineer School

Signals: Signal School

Logistics: Logistic Training Centre, Ordnance School, Veterinary School

Reserves

About 30,000 reservists are put through refresher courses each year, either in complete reserve units or at the permanent schools.

EQUIPMENT AND ARMS INDUSTRY

Small arms: M-62 7.62mm assault rifles and LMG (Russia)

Mortars: 81 mm mortar (Britain) and 120mm mortar (Russia)

Anti-tank missiles: Vigilant (Britain) and SS11 (France) wire-guided missiles; 55 mm and 95 mm recoilless projectile launchers (Russia)

Artillery: 122 mm and 130 mm field guns (Russia); 122 mm and 152 mm howitzers (Russia)

Anti-aircraft: ZSU-57 mm and ZU-23 mm (both twin-barrelled; Russia)

Artillery: 35 mm Oerlikon (Denmark); 40 mm Bofors (Sweden)

APC: BTR 50 P (Russia)

Tanks: T-54, T-55 medium tanks and PT-76 reconnaissance tanks (Russia); some old British Charioteers (now training only)

Finland manufactures little military equipment of her own. The most important manufacturers are Kemira (ammunition), SISU (Suomeni Auto-Teollisuus, which produces the A-45 four-wheel-drive truck, the KB-45 cross-country vehicle, the Terra cross-country tractor, the Terri motor sledge) and Tampella (mortars).

RANK, DRESS AND DISTINCTIONS

Commissioned ranks are lieutenant, senior lieutenant, captain, major, lieutenant-colonel, colonel, major-general, lieutenant-general and general. (Mannerheim held the unique rank of Marshal.)

Regular non-commissioned ranks are staff-sergeant, sergeant-major, lieutenant and senior lieutenant.

Conscript ranks are private, corporal and sergeant.

The Finnish army wears an extremely simple grey-green uniform with collar and tie; badges of rank are worn on the collar. Major-, lieutenant- and full generals wear respectively one, two or three Finnish lions. A mottled camouflage suit is worn in the field, with knee-boots, and white smocks and trousers in winter.

CURRENT DEVELOPMENTS

Finland's army ought, given the diplomatic situation of the country, to be either the puppet of a foreign power, or a decorative irrelevance. In practice, it is an independent force of high fighting value, which continues to enjoy wide popular support. Its strengths are in its well-proved ability to use the country's terrain and climate to advantage; every Finn skis from childhood, so that its winter-warfare capability is probably unmatched by any army in the world, while the skill and training of its engineers in barrage construction makes the approach to the Finnish heartland through the lakeland of the south-east an even more militarily questionable procedure than it looks on the map.

It is ironic that a neutral State like Finland, almost alone among the democracies of Europe, should continue to believe in the army as the 'School of the Nation' and see it as 'the Nation in Arms'. But that it continues to do. Although there has recently been agitation to loosen the hold of the President (who enjoys wide powers in Finland) and of General Headquarters on the army, and increase parliamentary control, the army remains an 'above party' institution of great popularity, which is reinforced by its distinguished role as a United Nations peace-keeping force.

JOHN KEEGAN

FRANCE

HISTORY AND INTRODUCTION

The French army disputes with the British the title of the oldest of Europe's (and of the world's) national armies. It is notable as a social or political institution for other important reasons: for the principle of universal conscription on which it was early established and for the equation made by its Revolutionary leaders between the performance of military service and enjoyment of the rights of citizenship — two principles very much alive in the modern world; for its function as a vehicle of revolutionary change between 1789 and 1815; for its adoption of the role of 'school of the nation' in the late nineteenth century; and for its frequent intervention in French domestic politics at moments of crisis (e.g. de Gaulle's recall to power in 1958 and the Algerian *Putsch*). It is also important for its almost single-handed creation of the French colonial empire and — on the purely military side — for the primacy it exercised among European armies for almost 200 years (1650–1850). It pioneered the modern sciences of gunnery, siege-craft, military engineering and fortification and made fundamental innovations in principles of staffwork and organisation.

1400–1600

The origins of the French army, like those of most other European armies, are traced to the decline of the feudal military system, in the middle of the fifteenth century. The mercenary bands which had come into being, first to supplement, then to replace knight-service, proved an unstable factor in a kingdom plagued by foreign aggression and internal strife. Successive kings attempted to bring them permanently onto their payroll, while seeking a cheaper but equally efficient substitute from among their own subjects. Hence the existence, at the beginning of the sixteenth century, of '*compagnies d'ordonnance*' of native noblemen, the ancestors of today's *Arme blindée/cavalerie*; of a royal artillery; and of numerous *bandes* of mercenaries from which today's infantry descends.

1600–1800

The success achieved by the French kings in amalgamating these disparate elements into a single disciplined force may be recalled by reading the long roll of its seventeenth and eighteenth century campaigns against Austria, Britain, Holland, the German States and Spain. But despite the reputation it had come to enjoy by 1789 as the leading European army, it was then, as much as any other French institution, ripe for reform. The nobility monopolised commissioned rank and the officer's career was emphatically not one open to talents. When the Paris mob rose, the Royal Army offered little resistance and while the majority of officers fled abroad, it transferred its loyalty to the Revolution. Many of the new leaders emerged from its ranks; others, like Napoleon, captain in the *declassé* Artillery, were former royal officers who saw their chance with the new order. Threatened almost at once by foreign invasion, the army, filled out with raw conscripts, saved the Revolution at Valmy in 1793. Reorganised by a War Minister of genius, Carnot, it was by 1796 pushing the Revolution beyond the frontiers of France. By 1800, when Captain Napoleon had vaulted to the First Consulship direct from the battlefield, it was poised to dominate Europe.

1800–1918

Militarily, the Napoleonic years were the most brilliant in the history of the French — and perhaps of any other army. And victory at the front was matched at the rear by the establishment of the first modern war economy and society. Wherever Napoleon moved, moreover, existing regiments and droves of conscripts — Italian, Spanish, German — were drafted into the *Grande Armée*. By 1815, France had become an almost wholly militarised society, while the elements of the Napoleonic military and administrative system had been disseminated throughout western Europe. The legacy was as important, in its way, as that of the Revolution's ideology.

Ultimately, Napoleon's exactions exhausted France, and the defeats of 1814–15 were an inevitable outcome of his misuse of country and army. As the restored Bourbons rightly suspected, however, the army's loyalty remained with Napoleon even after his downfall, and in order to break that tie, Louis XVIII disbanded all the regiments and reformed them as *Légions Départementales* of infantry and cavalry. He retained both the *Garde Nationale*, the armed revolutionary citizenry which, by 1815, had become a comfortably bourgeois force (and so a counterweight either to the army or the mob), and the principle of conscription, administered on a selective basis which spared the middle class. The latter system survived until 1870, when its disastrous effects were revealed in the Franco-Prussian War.

Louis's retention of the *Garde Nationale* also proved ill-judged, for in 1830 it was material in finally dethroning the

World Armies

Bourbons. Disregarded by Napoleon III, who lavished money on his successful (but small) regular army, it again sprang into prominence after the regulars' defeat in 1870: its men formed the garrison of Paris and the provincial armies whose unskilful bravery robbed the Prussians of complete victory. The Third Republic's government, anxious 'to recreate on French soil an exact copy of the army which had defeated Napoleon III's', yet unwilling 'to put a gun on the shoulder of every socialist', which it reckoned the introduction of Prussia's conscriptive system would achieve, was slow to find the answer to republican military needs. But when eventually rebuilt, the army proved in many ways the most brave, successful and politically subordinate of any France had known. However 'anti-republican' the Dreyfus affair implied it to be, it devoted itself between 1870 and 1914 almost wholly to 'la revanche' and preparation for it. And as the 'school of the nation', of which 1,700,000 citizens were to die between 1914 and 1918, it was remarkably successful in communicating to its conscripts the spirit of obedience and self-sacrifice so characteristic of its pre-1914 outlook.

1918–1968

The sufferings of World War I, which fell disproportionately on to the French army, broke its morale in 1917 and it was only slowly brought back to play a part in final victory. Appalled by the price of victory France affirmed her determination that it should never be paid again — and so authoritatively that in 1940 the reservists took their leaders at their word. The German occupation which resulted put all French officers in an exquisite dilemma, which only a few solved by rallying to de Gaulle's army in exile. Upon those who did, and returned victorious in 1944, fell the duty of rebuilding the army — as it had been rebuilt in 1870.

The results this time were different. For de Gaulle's army had been built on the colonial garrisons outside Vichy's control. It was strongly 'imperial' in spirit and, when called upon to fight two colonial wars in quick succession — first in Indo-China, 1946–54, then in Algeria, 1954–62, it took the government at perhaps better than its word. Most of the empire had been won by nineteenth century soldiers acting almost independently of Paris. The army now resolved to retain it, independent of the wishes of Paris, and, when Paris wavered in 1958, effectively dissolved the Fourth Republic and recalled de Gaulle.

He repaid his debt to the army in false coin, granting independence to Algeria despite the defeat the guerrillas had suffered at the army's hands. But the 'imperial' element in the army allowed him to do so by overplaying its bluff, which was called by the conscripts. They were unwilling to prolong the parachutists' war for no end they valued. However, when young men of the same age-group rioted to demand de Gaulle's removal during May, 1968, the army, to which he turned at once for support (the explanation of his 'disappearance' from Paris on May 19th), gave it him. In doing so, it remained loyal to the majority of its traditions. More often than not, the French army supports constitutional authority.

STRENGTH AND BUDGET

Strength

Population: 53,750,000

Army: 330,000

Gendarmerie: 76,000

Total defence forces: 502,000 (navy 68,500; air force 103,600)

Conscripts in defence forces: 273,000 (of whom 66% are in the army)

Reserves

Army: 400,000 (of whom 75% allotted to D.O.T. — see later)

Gendarmerie: 80,000

Budget

GNP (1976 estimate): \$353,200,000,000

Defence expenditure (1977): \$11,720,000,000

Third (1971–5) procurement budget: Fr. 82,400,000,000

Army allocation: Fr. 17,140,000,000 (20.8%)

COMMAND

Political

1. The Commander in Chief of the three *Armées* — *de Terre* (army), *de Mer* (navy), *de l'Air* (Air Force) — is the President of the Republic. The main defence decisions are taken by him, though he consults the *Conseil Supérieur de la Défense Nationale* (a consultative body) and confers with the *Comité de Défense* (a committee of ministers). It was believed that M. Pompidou, to a far greater extent than General de Gaulle, devolved defence decisions onto the Prime Minister, whose organ of defence decision is the *Comité Restreint de Défense* (a defence sub-committee, personal to him). President Giscard is believed to pursue the same approach.

2. The *Ministre des Armées* controls the day-to-day administration of defence. He is assisted by a *Secrétaire-général*, whose staff also serves the President and administers all other important defence committees. It is half military and half civilian in composition. He is also assisted by a Ministerial Armaments Delegation (see Equipment and Arms Industry). The French parliament debates and votes the defence budget.

Military

1. The Chief of Defence Staff (*État-major des Armées*) heads the fully unified defence system which France has possessed since 1961. He is also Vice-Chairman of a Chiefs of Staff Committee, and directly oversees the operations of the three services, since their units are organised on functional lines into four main forces:

- (a) *Forces Inter-Armées d'Intervention* (tri-service).
- (b) *Forces Nucléaire Stratégique* (air and missile units)
- (c) *Forces de Manœuvre* (army and air)
- (d) *Forces de Défense Opérationnelle du Territoire* (D.O.T., mainly army).

2. The Service Chiefs of Staff are responsible for appropriate non-operational matters. The Army Chief (*État-major de l'Armée de Terre*) commands:

- (a) Seven military regions in France.
- (b) The First French Army (including army units in the French Forces in Germany).
- (c) Army units in four joint overseas commands:
 - (i) French Polynesia (Tahiti).
 - (ii) South Indian Ocean (Réunion).
 - (iii) West Indies (Fort de France, Martinique).
 - (iv) Pacific (Noumea, New Caledonia).

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

Between 1948 and 1964 the promulgation of a series of government decrees established a 'total' concept of defence, in obedience to which distinctions between 'peace' and 'war' which formerly had important legal implications were abolished, and military and civilian structures of the State unified. In practice, the roles of the army remain the traditional ones of national defence, assistance to allies and protection of overseas interests. Internal security, because of the large paramilitary police force, is of secondary importance.

Commitment

France, though not a military partner, remains a member of NATO. She has had, since 1964, a bilateral treaty with the German government which permits her to maintain two of her divisions on German soil, and in practice their operational tasks and staffs are closely integrated with NATO's. She also has bilateral defence agreements with 12 of her former territories: Cameroun, Benin, Ivory Coast, Niger, Mauritania, Senegal, Togo, Central African Empire, Chad, Congo, Gabon and Djibouti.

Deployment

Force de Manœuvre

The army component consists principally of the First French Army (the retitled *Armée du Rhin et Danube* which Marshal de Lattre led in the Liberation Campaign of 1944–5), two of whose divisions are stationed in Germany, while the remaining three are in France. Its I and II Corps (Table 1) contain tactical nuclear missile regiments, which are under the direct control of the President.

Forces d'Intervention

The army component (*Forces Terrestres d'Intervention*) consists principally of (a) the 11th (Parachute) Division, located at Pau, Basses-Pyrénées, with two airborne brigades (20th and 25th); the 9th (Amphibious) Brigade, located at St-Malo and the 27th Alpine Division stationed in the Alps, consisting of the 17th and 27th Brigades formed from the famous *Chasseurs Alps*. The Alpine Division, is, however, allocated to the D.O.T. while the parachute and amphibious brigades, which train frequently overseas, are designed for rapid deployment abroad. The French navy's marines, *Groupement Commando de Fusiliers-Marins*, stationed at Brest, also act as part of the intervention force.

World Armies

Table 1 I and II Corps

<i>Division (H.Q.)</i>	<i>Mechanised brigades (H.Q.)</i>	<i>Motorised brigades (H.Q.)</i>
I CORPS (H.Q. NANCY)		
4th (Verdun)	10th (Rheims); 16th (Metz)	15th (Verdun)
7th (Mulhouse)	6th (Strasbourg); 7th (Besançon)	8th (Luneville)
8th (Compiègne)	2nd (St-Germain); 14th (Laon)	4th (Beauvais)

1st (Trier)	1st (Saarburg); 3rd (Wittlich)	11th (Landau)
3rd (Freiburg)	5th (Tübingen); 12th (Offenburg)	13th (Conzanz)

Army Units in Overseas Commands

These comprise, in the Ivory Coast, one mixed regiment; in Senegal, one mixed regiment; in Gabon, a parachute company; in Chad, one mixed regiment; in Martinique, one regiment; in the Pacific, one foreign legion and one mixed regiment; in Djibouti, one foreign legion and one mixed regiment; in Réunion, two infantry regiments.

Forces de Défense Opérationnelle du Territoire (D.O.T.)

The army element is known as the *Forces du Territoire* and its organisation has, since the 1950s, been closely integrated with the civil administrative structure. This step was prompted initially by the wave of 'insurrectionary' strikes of 1947-8, which revealed that in times of widespread disorder the central government, which has always exercised very direct control over the provinces, needed an intermediate organisational tier between it and the *départements* if it were to act effectively. Hence the grouping of the 95 *départements* into seven 'super-prefectures' known as *Régions de Défense*. The *Régions Militaires*, whose number has been reduced to seven, have been made to correspond geographically and their commanding generals are the military colleagues of the 'super-prefects'.

In times of emergency, they would form joint staffs, and pool their forces. These consist, on the civil side, of the urban police, the riot police (*Compagnies Républicaines de Sécurité*; C.R.S.) and the two intelligence services of the Ministry of the Interior, the *Renseignements Généraux* (R.G.) (political intelligence), and the *Surveillance du Territoire* (S.T.) (counter-espionage). On the military side the available forces comprise the *Gendarmerie Nationale* (rural police and internal security companies, normally under civil control), of the 21 'commando' regiments and four armoured-car regiments of the army's *Forces du Territoire*, and, if mobilisation was declared, of 95 reserve regiments (*Régiments Divisionnaires*), one to be raised in each *département*.

The army maintains a small military liaison team in each *département*, working with the prefect, and a larger staff, under a *Général Divisionnaire*, in each of the 21 *Circumscriptions d'Action Régionale*. These civil circumscriptions, which are subdivisions of the seven *régions*, correspond geographically to the 21 *Divisions Militaires*. If mobilisation were declared the 21 existing 'commando' regiments would each become the nucleus of an operational brigade, to be completed by the reserve regiments. Before mobilisation can be declared, three preliminary states of emergency must be declared: *troubles* (civilian authority operations); *mise en garde* (the military assume authority); and *état de siège*. It is, however, difficult to envisage this elaborate machinery being called into action in contemporary circumstances, and this lack of credibility is reflected in the unpopularity of service in the D.O.T. among regular soldiers.

Administrative Structure of the D.O.T.

- (a) Civil administrative areas
- (b) Military administrative areas
- (c) Civil authorities
- (d) Military authorities
- (e) Local military units
- (f) Local gendarmerie units

(a) Région de défense (7)	Circumscription d'action (21)	Département (95)
(b) Région militaire (7)	Division militaire (21)	—
(c) Préfet de défense (7)	Préfet de circonscription (21)	Préfet (95)
(d) Général commandant (7)	Général divisionnaire (21)	Military liaison team (95)
(e) —	'Commando' regiment (21)	Reserve regiment (inactive) (95)
(f) Commandement de région (7)	Commandement de circonscription (21)	Groupement (95)

Recent Operations

Although the French have fought two large colonial wars since 1945 (Indo-China 1946–54 and Algeria 1954–62) and suffered in that period proportionately higher casualties, particularly in officers, than any army except the American, Chinese and Vietnamese, it has had very little operational experience in the last 10 years. Its most notable involvement has been in the anti-guerrilla campaign in the Republic of Chad, where the 6th Mixed Regiment and the 2nd Foreign Legion Parachute Regiment have been engaged side by side with the small and undertrained local army against anti-government rebels since 1968. The campaign attracted unfavourable political attention in France in 1971, however, despite the very small casualties suffered (49 up to September, 1972), and the Legionnaires have subsequently been withdrawn, President Tombalbaye announcing that his troops (7000 strong) would henceforth assume responsibility for internal security. A parachute company was also stationed in the then Central African Republic from 1967 to September, 1969 at the request of the then President Bokassa.

The French army, so active in internal politics through the period 1958–62 (i.e. through its acquiescence in the disturbances of May, 1958 in Algeria, Corsica and metropolitan France, which brought de Gaulle to power; through the complicity of certain units in the abortive anti-Gaullist revolt in Algiers of January, 1960, known as 'the week of the barricades'; and through the 'generals' *putsch* of April 22nd, 1961) has subsequently taken no overt part in the political life of the nation. It was not called out of barracks during the *événements* (the anti-de Gaulle riots of May, 1968) which were suppressed by the civil police and the gendarmerie. A French parachute battalion, 2 R.E.P., intervened at Kolwezi, Zaïre, on May 19th, 1978 to rescue survivors of the anti-European massacres (see also Belgium), and a battalion of *Infanterie de Marine*, 3 R.P.I.M., arrived in Lebanon in March, 1978 to form part of the UN peacekeeping force. The parachutists were quickly withdrawn, but the peacekeeping unit remains.

ORGANISATION

Arms of Service

The modern French army is really an amalgamation of three historically separate forces: the home army (*Armée du Métropole*); the Army of Africa, which formed part of the metropolitan army but was stationed and largely recruited in north and west Africa; and the Colonial Army (*Troupes Coloniales*), which at different times was under the command of the Ministries of the Navy and the Colonies. The Army of Africa (which included the Foreign Legion), was the creation originally of the Orleanist Monarchy of 1830–48, which initiated the penetration of the continent; the Colonial Army descends from the colonial garrisons of the old pre-revolutionary Ministry of the Navy, and its surviving regiments are once again known as *Troupes de Marine* (not to be confused with the *Fusiliers-Marins*, the modern French navy's marines). The metropolitan army's infantry and cavalry also claim descent from the pre-revolutionary regiments, but very few can trace an unbroken lineage. There is, finally, a fourth component of the army: the *Gendarmerie Nationale*, which polices the countryside, provides internal security units and is effectively commanded by the Ministry of the Interior. Its origins are also pre-revolutionary.

Infantry

These diverse historical origins help to explain the existence of four different sorts of units within the infantry: *Infanterie Métropolitaine* (36 regiments); 12 battalions or *groupements* of *Chasseurs* (six alpine, six mechanised); six regiments of the Foreign Legion; and 19 regiments of *Infanterie de Marine*, some still locally recruited (e.g. in the Pacific and the West Indies). Two of the metropolitan, five of the marine and one of the legion infantry regiments are parachutists. Tours of duty in the parachute regiments have been restricted in length since the 1960s, because of the dissident reputation the parachutists won in Algeria; officers may now serve only for about 3 years up to the rank of captain, and about 4 years altogether thereafter. All regiments are now organised as single battalions, but those which are mechanised contain both armoured-infantry and tanks, while some of the *Marine* troops are mixed units (*Régiments Inter-Armes d'Outre-Mer*: RIAOM) which serve overseas. Regimental abbreviations, almost always used, are:

R.I.	<i>Régiment d'Infanterie</i>
R.I.Méca	<i>Régiment d'Infanterie Mécanisée</i>
R.I.M.	<i>Régiment d'Infanterie Motorisée</i>
R.I.Ma.	<i>Régiment d'Infanterie de Marine</i>
G.C.M.	<i>Groupeement de Chasseurs Mécanisés</i>
B.C.A.	<i>Bataillon de Chasseurs Alpains</i>
R.E.I.	<i>Régiment Étranger d'Infanterie</i>
D.B.L.E.	<i>Demi-brigade de la Légion Étrangère</i>
R.P.	<i>Régiment Parachutiste (e.g. R.E.P. = Régiment Étranger Parachutiste)</i>

World Armies

Cavalry

The Cavalry consists of 30 regiments, which preserve the ancient titles of *Dragons* (R.D.), *Cuirassiers* (R.C.), *Hussards* (R.H.) and *Chasseurs à Cheval* (R.C. à Ch.). The 1st *Spahis* (ex-north African cavalry), the *Régiment Étranger de Cavalerie* (R.E.C.), and the 501st *Régiment de Chars de Combat* (the original tank regiment) have also been kept in being for historical reasons. In theory, *Cuirassiers* man heavy tanks, *Dragons* light tanks, *Hussards* heavy armoured cars and *Chasseurs* light armoured cars, but these distinctions are not strictly observed. Some *Dragon* regiments are now mechanised infantry in the *Force de Manœuvre*, and three marine regiments (R.I.C.M., R.M.T. and 21st R.I.Ma.) are armoured.

Other Arms

The Artillery contains both metropolitan and *Marine* regiments. However, the *Génie* (Engineers), *Transmissions* (Signals), *Train* (Transport) and *Aviation Légère de l'Armée de Terre* — A.L.A.T. (Army Air Corps) are organised on straightforward functional lines. So too is the *Service du Matériel*, which supplies and maintains stores and equipment, the *Service de l'Intendance* (food and pay — assisted by the *Trésor*), and the *Service des Essences* (fuel supply).

Minor Services

Aumônerie (chaplains); *Service Vétérinaire* (veterinary); *Justice Militaire* (legal services); *Pionniers* (military labour); *Poste Militaire* (mail); and *Prévôte* (military police provided by *gendarmerie*); *Personnel Féminin de l'Armée de Terre* (P.F.A.T.) (women's service).

Titles of Sub-units Within Arms

Infantry:	régiment,	(bataillon),	compagnie,	section,	groupe
Cavalry:	régiment,	—	escadron,	peloton,	—
Artillery:	régiment,	groupe,	batterie,	—	—
Engineers:	régiment,	bataillon,	compagnie,	section,	escouade
Transport:	—	groupe,	compagnie,	peloton,	—

Operational Organisation

Forces de Manœuvre

The *Corps* consist of:

one tactical nuclear missile regiment, under direct control of the President, equipped with French *Pluton*; two armoured car regiments, with EBRs; two large motorised infantry regiments; four engineer regiments; one aviation wing of 10 aircraft and 46 helicopters; one anti-aircraft missile regiment; one electronics warfare battalion; one artillery locating battalion; one nuclear/biological/chemical warfare battalion.

Logistic support troops provide three identical groups each of:

one engineer logistic regiment; one transport regiment; one recover and repair battalion; one petrol supply company; one medical company.

The *Division* (known as the '1967 Division') contains:

one missile regiment (*see Corps*) and attendant protection battalion; one aviation group (GALDIV: 38 helicopters); one engineer regiment; one anti-aircraft missile regiment; one signals regiment; one services regiment.

The Mechanised Brigade (two per division) contains:

two infantry regiments, each of two light tank companies and two infantry companies in armoured carriers; one heavy tank regiment (54 AMX 30s); one artillery regiment (15 155 mm self-propelled howitzers).

The Motorised Brigade (one per division, constituting its reserve) contains:

two wheeled infantry regiments; one light tank regiment (5 AMX 13s); one artillery regiment (18 105 mm self-propelled howitzers).

Both types of brigade also contain a service battalion and are very strong in anti-tank missiles. Infantry regiments are 700–750 strong, and all units in the *Forces de Manœuvre* are kept at 90% of war strength.

Forces d'Intervention

The Parachute Brigade contains:

three infantry battalions; one support regiment; one services battalion.

The Alpine Brigade contains:

three to four infantry battalions; one armoured car regiment; one artillery regiment.

The Amphibious Brigade contains:

three infantry battalions; one mechanised regiment; one artillery regiment; one services battalion.

Forces du Territoire (D.O.T.)

21 infantry ('Commando') regiments containing 750 men and 75 vehicles (mostly jeeps). Four armoured car regiments equipped with AMLs.

Gendarmerie Nationale

This national police force, though controlled day-to-day by the Ministry of the Interior, belongs to the army. It has a dual organisation: (a) the *Gendarmerie Mobile*, organised into *Groupements*, *Escadrons* and *Pelotons* and equipped *inter alia* with armoured cars and helicopters, provides internal security units (and traffic police); (b) the *Gendarmerie Départementale* is the rural police force, but also an important intelligence-gathering agency. It maintains a *Brigade* (5–40 men) in each of France's 3000 cantons, a *Compagnie* headquarters at the next administrative level, the *Arrondissement*, and a *Groupement* headquarters in the main town of the *Département*. *Mobile* and *départementale* units are controlled at the next level by a *Commandement de Circonscription* and above that, by a *Commandement de Région*, whose chief would come under command of the 'super-prefect' in times of emergency, but normally takes orders from Paris. The *Garde Républicaine* are the best known *Gendarmerie* unit, and protect the President's residence, besides providing ceremonial guards on occasions of state.

RECRUITMENT AND TRAINING

Officers

Cadet Training

Regular officers (*officiers de carrière*) are recruited, (a) by competitive examinations (*concours*) among school leavers who have completed a 2 year course of preparatory studies, and (b) by commissioning NCOs.

Most officer training is carried out at Coëtquidan (Morbihan) in Brittany, to which the *École Spéciale Militaire de St-Cyr* was moved in 1946. Also located there is the *École Militaire Inter-Armes*, where selected NCOs are trained. Training at the E.S.M. is for 2 years; at the E.M.I.A. for 1 year. Each school produces about 250 officers a year; E.S.M. graduates enjoy a 10% higher rate of pay up to the rank of Commandant, and thereafter rather better promotion prospects. On commissioning into their different arms of service, *sous-lieutenants* go for a 1 year course to the appropriate *école d'application* (special-to-arm-school):

<i>Infanterie</i> : Montpellier	<i>Transmissions</i> : Montargis
<i>Arme blindée</i> / <i>Cavalerie</i> : Saumur	<i>Train</i> : Tours
<i>Artillerie</i> : Chalons or Nîmes (soon Draguignan)	<i>Matériel</i> : Bourges
<i>Génie</i> : Angers	<i>Gendarmerie</i> : Melun

On promotion to captain (age about thirty), officers return to their *école d'application* for 6 months.

Higher Military Education

Junior staff officers are trained, after selection, at the *École d'État-major*; more important is to succeed in the competitive examination (84% fail) for entry to the *École Supérieure de Guerre* (located with the former in the *École Militaire* building in Paris). Entry takes place at major rank, age 38–42 years, and is an essential precondition for command of a major fighting unit. The highest level of military education is provided at the *Centre des Hautes Études Militaires* (same building) where about 20 officers of colonel rank train for the most senior defence posts; co-located is the *Institut des Hautes Études de Défense Nationale*, for senior civil servants. The two higher institutes work in harness.

Other Officers

Four other sorts of officer are found in the French army: technical officers, selected by *concours* from among NCOs; old NCOs, near to retirement, commissioned direct as *sous-lieutenants*; suitable civilian candidates awarded short-service commissions, and suitable conscripts (particularly those who have completed a voluntary period of *préparation militaire* as schoolboys) commissioned as *sous-lieutenants de réserve*.

World Armies

Technical Officer Training

Regular officers may proceed at captain rank to the *Enseignement Militaire Supérieur Scientifique et Technique* for training in weapons technology, electronics, etc. and usually thereafter remain in those fields.

Medical Officers

They receive both their medical and military training at the military medical school in Lyon.

École Polytechnique

This famous school, once the source of all French artillery and engineer officers and still run as a military establishment, no longer supplies more than the odd individual to the army. Its cadets (*Les X*) surrender their commissions on graduating and enter civilian State service or private firms.

Military Schools

The army runs six military boarding schools (*Collèges Militaires*) with favourable terms for sons of living and dead soldiers. The most famous is the Prytanée de la Flèche; the others are set in the restored buildings of the original St-Cyr, and at Aix-en-Provence, Le Mans, Autun and Tampon (Ile de Réunion in the Indian Ocean). Subsequent military service is optional but common.

Current Situation in Officer Recruitment and Training

The French officer retains his traditionally high social standing, though it is somewhat affected by the widening gap between military and other professional salaries. The St-Cyr quota is filled each year without a lowering of standards, though the number competing declines. Recruiting is also localised, many more *Cyrrards* coming from the east and extreme west than from the north and centre. The most notable trend since the war has been for St-Cyr to become self-recruiting; in 1954–8 an average of 44% of *Cyrrards* were themselves the sons of soldiers and the proportion continues slowly to increase.

The French officer corps seems to have recovered from the strains it underwent during the years of the Fourth Republic and of de Gaulle. It has been much reduced in size, many officers having been induced to retire prematurely by handsome gratuities, and promotion, though still slow by British and American standards, has quickened. A deliberate attempt has been made, by the political and military leadership alike, to banish memories of empire and to lead the army back to the traditions of 'silence' and of 'defence of the homeland' characteristic of its spirit between 1870 and 1914. The French army remains, nevertheless, essentially right-wing and catholic in temperament, and is still characterised by internal cliques and political patronage to a degree which British and American soldiers would find surprising. No survey of French domestic or foreign affairs should leave the mood of the officer corps out of account.

NCOs and Soldiers

Conscription and Regular Soldiers

All Frenchmen on reaching the age of 18 years become liable for military service and about 75% of each annual contingent is inducted. There are deferments for students (*see* Current Developments). The term of service has been reduced from 16 months to 1 year. It is also possible to enlist as a regular soldier on a 5 year engagement. Almost all NCOs, the Foreign Legion and many of the *Troupes de Marine* are regulars.

Conscript training, which is carried out in the regiments, lasts 6 months: 4 months basic, one in camp, one at a commando centre. One result of this system is that regiments devote half their annual working life to training. The *Troupes de Marine*, Foreign Legion and some other branches have their own training regiments.

NCOs

NCOs enter the army by three routes: either via the *Écoles d'Application*; or via the *École Nationale de Sous-Officiers d'Active* (ENSOA) at St-Maixent; or via regiments, and then to St-Maixent. The standard of training is high, but except in the technical corps they receive less responsibility than in the British or American armies.

EQUIPMENT AND ARMS INDUSTRY

Control

France has had one of the leading armaments industries of Europe since the seventeenth century. As well as ship-building, it

now includes explosives, weapons, aircraft and aerospace industries. Research, development and production are under the sole direct control of a senior civil servant, the Ministerial Delegate for Armament (DMA), an immediate subordinate of the Minister of Defence. His delegation has various technical directorates: those supplying equipment to the army are the technical directorates for ground armament (DTAT — *Direction Technique des Armements Terrestres*), missiles (DTEn — *engins*) and powders and explosives (DP — *poudres*); the army also deals with those for aeronautical equipment (DTCA — *Constructions Aéronautiques*) and for research and testing (DRME — *Recherches et Moyens d'Essai*). DRME does not conduct research itself, but collates military requirements and oversees their development in private or public centres.

Production

The French armaments industry is mainly financed and controlled by the State, and much of it is fully nationalised. Some weapons factories have been State-owned since the eighteenth century.

Weapons Factories

1. *Armoured Vehicle Manufacturers*: Société de Construction Mécaniques Panhard et Levassor: 18 Ave. d'Ivry, Paris — armoured cars and personnel carriers. Direction Techniques des Armements Terrestres (DTAT): HQ Caserne Sully, 92-St Cloud — tanks, APCs, self-propelled artillery; many works throughout France, main centres at St-Étienne and Châtellerault.

2. *Gun Manufacturers*: DTAT.

3. *Infantry Weapons*: DTAT.

4. *Helicopters and Aircraft*: Aérospatiale (amalgamation, 1970, of Nord Aviation and Sud Aviation); HQ: 12 Ave. Bosquet, Paris; works throughout France at St Aubin-de-Médoc, Bourges, Cannes, Châteauroux, Châtillon, Courbevoie, La Courneuve, Les Mureaux, Marignane, Meaulte, Nantes, Puteaux, St Nazaire, Suresnes and Toulouse.

5. *Radar and Electronic Equipment*: Thomson C.S.F., rue des Mathurins, 92-Bagneux. Électronique Marcel Dassault, 55 Quai Carnot, 92-St Cloud.

6. *Missiles and Projectiles*: Luchaire S.A., 180 Boulevard Haussmann. Constructions Navales et Industrielles de la Méditerranée (C.N.I.M.), 50 Champs Élysées, Paris — RAP 14 missile. Direction Technique des Engins (DTEn) (*see* DMA earlier).

Direction des Poudres (*see* DMA above) — explosives, shells and small-arms ammunition. Aérospatiale (*see* above) — helicopters; SS-11, ENTAC and HOT anti-tank missiles.

Equipment Suppliers

The major items of equipment supplied to the French army are:

Light Aircraft: Broussard: liaison six to eight seats/casualty evacuation (two stretchers). Nord 3400: observation, two seats (Aérospatiale)

Light Helicopters: Alouette II and Alouette III: liaison seven seats/casualty evacuation (two stretchers); can be fitted with SS-11 anti-tank missiles (Aérospatiale). Gazelle: under development to replace the Alouette

Heavy Helicopters: SA-30 (*hélicoptère de manœuvre*); designed to carry a section of 12 infantrymen in all-weather conditions (Aérospatiale/Westland)

Medium Tanks: AMX-30: 32.5 tons, 105 mm gun, cross-country speed 21–25 mph, crew of four; equips the tank regiments in the mechanised brigades

Light Tanks: AMX-13: 14.5 tons, 90 mm gun (and sometimes four SS-11 anti-tank missiles), cross-country speed 25 mph, crew of three; equips the tank companies in the mechanised regiments and the light tank regiment in the motorised brigade

Armoured Cars: EBR (*Engin Blindé de Reconnaissance*): 13 tons, 90 mm gun, maximum speed 60 mph, crew of four; equips the reconnaissance regiments of the *Forces de Manœuvre*; an ageing but excellent vehicle. AML (*auto-mitrailleuse légère*): 5 tons, 90 mm gun or 60 mm mortar, maximum speed 60 mph, crew of three; equips the armoured regiments in the D.O.T.

Armoured Personnel Carriers: A version of the AMX-13; has a 20 mm cannon in turret and carries a section of 12 men, who are trained to fire from it; over 10 years old, it is now being replaced by an amphibious vehicle; equips the infantry of the mechanised brigades. Other variants of the AMX-13 are an armoured recovery vehicle, an ambulance, a cargo carrier and the items immediately below —

Artillery: 105 mm howitzer on AMX-13 chassis: two versions — limited or all-round traverse (AMX 105A and B); range 15,000 m. 155 mm howitzer on AMX B chassis; range 20,000 m. Anti-aircraft mounting: twin 30 mm cannon. The 105 mm equips the artillery regiment in the motorised brigade; the 155 mm that in the mechanised brigade. 105 mm (Italian) pack-howitzer; equips the artillery regiments of the *Force d'Intervention*

Missiles: The corps and divisional artillery regiments (56 launchers in all) were equipped with American Honest John missiles with nuclear warheads (range 75 miles) which are being replaced by all-French Pluton missiles (15–20 kt

World Armies

warhead, same range). Anti-tank guided missiles include (a) the ENTAC (in the support company of the motorised infantry; weight 40lbs, range 2000 m); (b) the SS-11 (AMX-13 or light helicopter mounted; it is the anti-tank weapon of the mechanised brigades; weight 130lb, range 3000 m); and (c) two new missiles (MILAN and HOT) under development jointly by France and Germany (Aérospatiale/Messerschmitt). A new multiple artillery missile (the RAP 14) is also under development by CNIM

Engineer Equipment: There is an excellent range of bridges and ferries based on the low-pressure-tyred Gillois vehicle
Ground Surveillance. (a) *Radars:* *Rasura* and *Olifan* man-portable short-range radars. (b) *Radios:* PP11, PP12, man-portable company and platoon sets, 5–15 miles range

Support Weapons and Small Arms: There are five sorts of mortar — three of 120 mm which equip the support company in infantry regiments and two of 80 mm which are in the rifle companies. The *machine-gun* serves as both a light and medium weapon. It is the same calibre as the *rifle*. The *sub-machine-gun* is issued to over half the men in the infantry company, and the riflemen are only trained to hit targets at 200 m (except for three *tireurs d'élite* who are equipped with sniper's rifles).

DRESS, DISTINCTIONS, RANK, COLOURS AND DECORATIONS

Dress

'Horizon blue', which was adopted in place of the famous red trousers and blue *capote* in 1915, gave way in the 1930s to khaki, which has been worn ever since; the present style is reminiscent of British service dress; officers wear a slightly paler colour than men. Both wear buff cotton summer uniform. The cylindrical peaked képi, in a distinctive 'Arm' colour, is still worn by officers, NCOs and certain entire units (e.g. the Legion) on formal occasions; otherwise they, with the rest of the army, wear a blue beret (red for parachutists). The *Chasseurs* wear a huge version (*la marmite*) and a dark-blue uniform. Officers have a simple evening uniform whose colour recalls 'horizon blue'. Of the magnificent full dress of the nineteenth century, the *Garde Républicaine* preserve the cuirassier and infantry versions; St-Cyr still wears its red trousers and white and red plumes (*le casoar*) and the white gloves its young men donned for battle in August, 1914; the *Polytechnique* keeps its frock coats and cocked hats and the 1st *Spahis* their red and white Moorish cloaks.

Distinctions

Soldiers indicate their regiment and arm of service in a variety of ways. Most units wear a metal pendant badge on the right breast pocket; designs recall the regimental history where appropriate. The beret badge, and the colour of the shoulder-straps and of a sleeve lozenge, indicate arm of service.

Arm	Colour	Metal Pendant Badge
Infantry	Dark blue	Flaming grenade
Foreign Legion	Grass-green and red	Legion's grenade
Chasseurs { mécanisés alpins	Yellow	Huntsman's horn
Cavalry { Dragons Cuirassiers Hussards Chasseurs de Cheval	White Red Light blue Green	Mounted knight
Artillery	Red	
Engineers	Black velvet	Breastplate and helmet
Transmissions	Black velvet	Breastplate and helmet with a 'T'
Train	Light green	—
Matériel	Light blue	—
Médical	Dark red	Rod of Aesculapius

Parachutists wear a winged dagger in the beret; *Troupes de Marine* an anchor on their shoulder-straps. There are a number of other minor distinctions.

Rank

Rank is indicated by sleeve *chevrons* (point upmost) for NCOs, shoulder stripes (*galons*) for officers and stars for generals:

Field-Marshal (<i>Maréchal</i>)*	Seven gold stars
General (<i>Général d'Armée</i>)	Five gold stars

Lieutenant-General (<i>Général de Corps d'Armée</i>)	Four gold stars
Major-General (<i>Général de Division</i>)	Three gold stars
Brigadier (<i>Général de Brigade</i>)	Two gold stars
Colonel (<i>Colonel</i>)	Five gold stripes
Lieutenant-Colonel (<i>Lieutenant-Colonel</i>)	Three gold, two silver stripes
Major (<i>Commandant</i>)†	Four gold stripes
Captain (<i>Capitaine</i>)	Three gold stripes
Lieutenant (<i>Lieutenant</i>)	Two gold stripes
2nd Lieutenant (<i>Sous-Lieutenant</i>)	One gold stripe
Officer-Cadet (<i>Aspirant</i> (reserve rank))	One gold stripe broken by red
Warrant Officer Class I (<i>Adjudant-Chef</i>)	Two thin gold stripes
Warrant Officer Class II (<i>Adjudant</i>)	Two thin silver stripes
Staff-Sergeant (<i>Sergent-Major</i>)‡	Four gold chevrons
Colour-Sergeant (<i>Sergent-Chef</i>)‡	Three gold chevrons
Sergeant (<i>Sergent</i>)‡	One gold chevron
Lance-Sergeant (<i>Caporal-Chef</i>)§	One gold, two red chevrons
Corporal (<i>Caporal</i>)§	Two red chevrons
Lance-Corporal (<i>Soldat de 1ère Classe</i>)	One red chevron
Private (<i>Soldat de 2me Classe</i>)	—

Notes: * Marshal of France is not a rank but a 'Dignité d'État' (high State honour). It can be conferred only on a general who has led an army to victory against the enemy. Allowed to lapse after 1870, it was not conferred again until 1918; after 1945 it was conferred on Generals Leclerc, Juin and de Lattre de Tassigny. There are no living Marshals.

† Commandants known as *Chef de Bataillon* in the infantry, *Chef d'Escadrons* in the cavalry and *Chef d'Escadron* in the artillery.

‡ Substitute *Maréchal des Logis* for *Sergent* in cavalry and artillery.

§ Substitute *Brigadier* for *Caporal* in cavalry and artillery.

Colours

Each French unit '*formant corps*' (having a permanent and constitutional existence) possesses a tricolour standard or colour, appropriately inscribed. It is carried on ceremonial parades and may be 'decorated', in token of the unit's performance in battle, with the *Légion d'Honneur*, *Médaille Militaire*, etc.

Decorations

French awards for bravery or for meritorious service are: the *Légion d'Honneur* (five classes), the *Médaille Militaire* (for bravery or victorious generalship only); *Croix de guerre*; *Croix de la Valeur Militaire* (Algeria). All are awarded both to officers and men.

CURRENT DEVELOPMENTS

The French army, which at the end of World War II had lost almost everything of an army's substance — modern equipment, trained soldiers, reserves, reputation — has remade itself and its name during the intervening years in the most impressive fashion. The convulsions brought on by the Algerian war may now be seen as temporary — though the army did so much to create the French empire, its centre of gravity has always been in the *métropole*, to which its heart has now returned. To a notable degree however, the post-war army has been 'Gaullist' in spirit. Its nucleus was the Free French Forces which rallied to the General after 1940 and returned with him to France in 1944; despite their subsequent disagreements, it was the army which recalled him to power in 1958.

The army is on a noticeably easier footing with the nation than is the case, say, in Germany. Despite the high proportion of the annual class actually conscripted (about 300,000 out of 400,000 for the three services), a recent poll revealed that more than 50% of young Frenchmen accept the principle of National Service and there are few conscientious objectors (objection is very difficult to establish, however: it was only legitimised by law in 1968 and successful objectors have to serve 2 years instead of 1 year, as non-combatants). The *lycée* riots of March and April, 1973 against the new conscription law (which lowered the term of service to 1 year) were a middle-class protest against a restriction of deferments (*le sursis*) for university students — originally demanded after *les événements* of 1968, by representatives of the middle-class students, to reduce the 'unfair' burden which fell on working-class youth. The working classes and the army are equally insistent that, given 1 years' service, all conscripts must take their turn between 18 and 21 years of age. The army declares it impossible to run units full of 25-year-old married men with university degrees. The working classes know that many graduates, in consequence, escape military service altogether.

World Armies

The concentration of defence expenditure on the creation of the strategic forces (nuclear ballistic missiles, bombers and submarines) has deprived the army of much of the equipment it would have liked to receive during the last 5 years. Its field forces (the *forces de manœuvre* and *d'intervention*) are nevertheless among the very best equipped and trained in Europe, and the current thinking about its deployment has, since the tacit abandonment of the Gaullist 'tous azimuths' strategy in the late 1960s, brought its operational plans back into line with those of the Western alliance.

REORGANISATION

Some organisational changes, which will not be completed until 1980, were introduced in 1977. The aim of the changes is to abolish the difference of function between the *Forces de Manœuvre*, *D.O.T.* and *Forces d'Intervention* and to increase the number of operational formations.

The number of Military Regions has been reduced to six. The number of divisions will be increased to sixteen, of which eight will be armoured, five infantry, one parachute, one alpine and one amphibious. The alpine and parachute divisions will be the existing 27th and 11th, the latter unchanged in strength. All the other divisions will be smaller: the armoured divisions will consist of two tank battalions of four tank squadrons each and two infantry battalions each of two tank squadrons and two infantry companies in APCs. The infantry divisions will consist of an armoured car squadron and three infantry companies in wheeled APCs. The alpine division will consist of six alpine battalions. Except in the parachute division, the brigade is abolished.

Three divisions (1st, 3rd and 5th, all armoured) will be stationed in Germany, instead of two as at present. Of the others, 4th Infantry and 6th, 7th and 10th Armoured will be stationed in the Sixth Military Region (eastern France); 2nd and 8th Armoured and 12th and 16th Infantry in the First and Second Military Regions (central and northern France); 14th Infantry and 27th Alpine in the Fifth Military Region (south-eastern France); 11th Parachute and 15th Infantry in the Fourth Military Region (south-western France); and the 9th *Division d'Infanterie de Marine* in the Third Military Region (north-western France).

The headquarters of the Military Regions will be: First, Paris; Second, Lille; Third, Rennes; Fourth, Bordeaux; Fifth, Lyon; Sixth, Metz. The four new divisions which will form the new *I Corps* (4th, 6th, 7th and 10th, which were being formed in 1977-8) will have their headquarters at Nancy, Strasbourg, Besançon and Chalons, respectively. The 9th, 14th and 15th, which are now in existence, have their headquarters at St-Malo, Lyon and Limoges. The Alpine Division has its headquarters at Grenoble.

JOHN KEEGAN

GABON*

HISTORY AND INTRODUCTION

Gabon, along with most of France's colonies in Africa, attained independence in 1960, but because of its small size and considerable mineral wealth has maintained very close links with France, in whose hands the exploitation of Gabon's uranium, oil and manganese very largely lie. It was because of these interests that French forces intervened in Gabon's internal affairs in 1964; the President, Leon Mba, had been arrested by a group of 150 soldiers led by three subalterns and a gendarmerie lieutenant. The small French garrison of 150 'community troops' was invited by the Vice-President to rescue President Mba and restore his government, which, with the aid of some reinforcements from Dakar, they quickly achieved. Since that time there have been no further military challenges to President Mba or to his successor, President Bongo.

STRENGTH AND BUDGET

Population: 1,000,000 (approximately) of which the largest ethnic group is the Fang who total 200,000 (approximately)
Army: 900, a gendarmerie of 1700, a small air unit of 100, a presidential guard of 600 and a paramilitary security force of 1000

COMMAND AND CONSTITUTIONAL STATUS

The President of the Republic, Omar Bongo, is Commander-in-Chief. The Army Commander is General Boulingui, and the Minister for Defence is M. Julien Mpuoho.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

No special role or commitment is perceived for the Gabon army other than general internal and external security.

ORGANISATION

The Gabon army comprises one large infantry battalion composed of a number of companies together with a 'paracommando' company and a reconnaissance company. The army's headquarters, the logistic, reconnaissance and paracommando companies are all in Libreville; the other company detachments are at Mouila, Oyem, Franceville, Tchibanga, Makokou, Pana and Cocobeach. A small women's unit exists, but may be one of part-time reservists only.

The Presidential Guard is better equipped, possessing light field and anti-aircraft artillery — all French 75 mm, 40 mm and 20 mm weapons. It is stationed in Libreville. Certain aircraft of the air force are included in the Guard.

The gendarmerie is commanded from Libreville and is divided into groups. The Northern Group has companies at Libreville, Makokou and Oyem; the Southern Group has companies at Port Gentil, Lambaréné, Mouila and Tchibanga; and the Eastern Group has a company at Moanda with detachments at Franceville and Koula Moutou.

RECRUITMENT, TRAINING AND RESERVES

The ethnic composition of the army has been estimated at 40% Fang, 40% Bapounou and 20% Omyene and others. Training assistance is provided by France.

EQUIPMENT AND ARMS INDUSTRY

The army has French infantry small-arms weapons and light unarmoured scout cars; the Presidential Guard is reported to

* For general notes on African armies, see Appendix 1.

World Armies

possess light field and anti-aircraft artillery (also French), though these reports have yet to be confirmed. The air force possesses two transports and seven helicopters, all French made; one report claims Mirage V fighters have been ordered.

RANK, DRESS AND DISTINCTIONS

Uniforms and the rank structure follow the French model.

CURRENT DEVELOPMENTS

Gabon's small size and its belief that France will ensure its frontiers make this force one of Africa's smallest armies.

The French contingent in 1976 consisted of a company of the *1st Hussars Parachutistes* and of the *17^e Régiment de Génie Aéroporté* stationed at *Camp de Gaulle*, Libreville, supported by the *6^e Infanterie de Marine*, also at Libreville.

L. L. MATHEWS

THE GAMBIA*

Gambia's Police Force includes a small barrack police detachment equipped with rifles. Some of this unit's officers have undergone professional military training in Britain or elsewhere.

There is a defence treaty with Senegal.

L. L. MATHEWS

* For general notes on African armies, see Appendix 1.

GERMAN DEMOCRATIC REPUBLIC

HISTORY AND INTRODUCTION

Although any German armed force is necessarily the inheritor of a long and immensely powerful military tradition, and in this the *Nationale Volksarmee* is no exception, its immediate origins are recent. Exactly how recent is a matter of dispute, depending on the significance allotted to successive measures of militarisation of the police force instituted in the Soviet zone between 1945 and 1952. By the latter date, however, the existence of an embryo national army on East German soil was, though forcefully denied by the Soviet government, undisguisable. It took the form of the *Kasernierte Volkspolizei* (Barracked People's Police), equipped with ex-*Wehrmacht* weapons, recruited in many cases from returned prisoners-of-war and numbering about 80,000 men organised into six divisions. Its recruitment was by voluntary enlistment and, though many of the very large number of deserters from it who made their way to the West revealed that they had volunteered in Russia in order to secure their release from prisoner-of-war camps, the force did attract, particularly at officer level, numbers of veteran communists, young party enthusiasts, or genuine converts from the traditional military class who were inspired by the challenge of creating a 'people's army' for a German communist State.

The motives of the Soviet government, on the one hand, and of the communist leadership of the Soviet zone, on the other, in permitting and fostering such a creation, are difficult to analyse. The Russians had, and still have, a genuine and understandable fear of German armed force; the German Communist Party (or Socialist Unity Party (S.E.D.) as the Communist and Social Democrat Parties were known after their shotgun union in 1945) equally had good reason to fear a reborn German army, the ruthlessness of military reaction against the 'popular' movements of 1848 and 1918 being a major theme of its own folklore.

The explanation of Soviet policy would seem to lie at several levels: a desire to reduce its own military budget by allowing East Germany to provide partly for its own defence against the 'aggressive NATO alliance'; a recognition that, for the authenticity of the sovereignty of an East German Communist State (whose creation was announced in October, 1949) to be accepted abroad, it should possess its own armed forces; a preference for domestic disturbances (should they arise) to be put down by German, rather than Russian, troops; a determination to match step-by-step all West German measures of remilitarisation, even if that should mean at times anticipating them. Russia has always represented each new departure in her East German policy as a response to an allegedly similar development in the Federal Republic; she has also been careful not to violate the strict letter of the Nuremberg Judgements — the East German army, for example, possessing in theory no General Staff, since that body was declared criminal by the International Military Tribunal.

The attitude of the S.E.D. (*Sozialistische Einheitspartei Deutschland*) was probably more straightforward. Being at the outset neither chosen nor loved by the population of which the Soviets had made it, within carefully restricted limits, the master, it was anxious to provide itself with a native armed force which would deter demonstrations of dissent and safeguard the regime from violence should it break out. Its leaders, most of whom had spent long periods in Russia, believed that they knew how the party could bind the infant army to its will without danger of subsequently losing control of it.

The evolution of the Barracked Police into the People's Army (including air and sea branches) had several significant landmarks. The original Alert Units (*Bereitschaften* — a word, like many others in the East German military vocabulary, with Nazi echoes) were at first under regional (*Bezirk*) control, but in October, 1948 were centralised under the Ministry of the Interior. The First Minister was Willi Stoph, with Wilhelm Zaisser ('General Gomez' of the Spanish Civil War) as his Commander of Barracked Police, and Heinz Hoffman, also an ex-International Brigader and a graduate of the Moscow Frunze Academy, as Deputy Commander (Zaisser, subsequently First Minister of State Security, 1950, was purged for 'defeatism' after the East German rising of June, 1953). In 1952, following a Soviet appeal for all-German elections and a promise of 'her own armed force' to a re-united and neutralised Germany — an appeal apparently intended to halt West German rearmament — there was a noticeable relaxing of Soviet and S.E.D. attempts to camouflage the existence of the Barracked Police. It was given Soviet-style military uniforms and two additional armed bodies — the Factory Combat Groups (*Kampfgruppen*) and the Sport and Technology Association (*Gesellschaft für Sport und Technik*) — came into being. Despite this strengthening of the military resources of the DDR, it was to suffer in the following year its most humiliating setback: a countrywide rising, most violent in East Berlin, against its policies and legitimacy. Over 300,000 people took part in strikes and demonstrations and, to add to the alarm of the S.E.D., they were joined by a significant number of its own soldiers, who did not as a body appear disposed to put down the disturbances.

Among subsequent recuperative measures instituted by the party, which included an expansion of the combat groups, was a thorough purge of the army: about 12,000 men, out of 80,000 serving, were dismissed. There has subsequently been no evidence of serious disaffection. This may in part be attributed to the ending of the army's ambiguous status in 1956, when on January 18th, 12 days after West Germany's induction of her first conscripts, the act creating the National

People's Army and the Ministry of National Defence was carried by the *Volkskammer* (Parliament). Traditional uniforms were reintroduced at the same time, Soviet advisers were henceforth progressively withdrawn from units, and on January 28th the Political Consultative Committee of the Warsaw Pact admitted the N.V.A. to its United Armed Forces.

Since 1965, the N.V.A. has belonged to the Pact's First Strategic Echelon — those forces which would immediately take the field in the event of conflict with NATO forces. This promotion of the army to the first rank of Soviet-bloc troops is chiefly due to the increase in quality and reliability of its soldiers brought about by the introduction of universal conscription in 1962 (Act of Parliament, January 24th), a measure made possible by the building of the Berlin Wall in the previous August (the constant exodus of men of military age to the West via West Berlin was one of the factors which drove the S.E.D to this extreme measure). But the N.V.A.'s skill in handling modern Soviet equipment, with which Russia has been increasingly generous, has contributed also to its gain in prestige and efficiency. Because of its small size — both absolute and proportionate to the population — it is the smallest of the Pact armies — the N.V.A. can never play a major role in Soviet strategy. Nor, given what we know of Soviet policy towards East Germany, is it likely that Russia would wish that it should. Nevertheless, it has become within the last 10 years an army of adequate quality, well-equipped and, at officer level at least, wholly loyal to the regime which it serves. This loyalty is in any case assured by the remarkably complex system of control and supervision which the party has embedded in the army's structure and which is described in another section. It is an index of its reliability that the East German government apparently insisted, and the Soviet government certainly agreed, that part of it should be used in the invasion of Czechoslovakia in 1968.

Technically, the *Nationale Volksarmee* is a tri-service organisation, the army (*Landstreitkräfte*) being only one element in it with the sea and air branches. Of these, however, the army proper is by far the most important. Unlike the old German army, however, whose insistence on being the 'sole bearer of arms within the State' underlay its conflict with Hitler, it is not the only armed force upon which the regime can call. The other militarised offshoots of the People's Police (*Deutsche Volkspolizei*), namely the Frontier Troops (*Grenztruppen*), the Alert Units (*Bereitseinheiten*) and the Guard Regiment of the Ministry of State Security (*Wach Regiment der M.S.G.*), together with the combat groups, provide the party with an ultimate counter-balance against the army's power, a feature of political organisation common to all States of the Soviet bloc.

STRENGTH AND BUDGET

Population: 17,264,000
Army: 105,000 active; 200,000 reservists
Air force: 36,000; 416 combat aircraft
Navy: 16,000 (200 ships, mostly small craft)
Security troops: 70,000 (Frontier Troops 48,000; Police Alert Units 25,000)
Paramilitary forces: 500,000
GNP (1976): \$48,000,000,000
Defence expenditure (1977): \$2,890,000,000

COMMAND AND CONSTITUTIONAL STATUS

Command of the 'people's army' is complicated, it being subordinated not only to the authority of the State but also to the Central Committee of the Socialist Unity Party, and its Politburo to the United Command of the Warsaw Pact and, for operational purposes, to the Commander of the Group of Soviet Forces in Germany (possibly also of neighbouring Soviet Groups).

Constitutionally, the army is immediately subordinate to the Minister of National Defence who, according to the act creating it, organises and leads the N.V.A. in accordance with the laws, decrees and decisions of the People's Chamber. Its tasks are 'decided by the Council of Ministers'. As in most communist countries, however, it is in the party's rather than the State's organs that real power resides, ministers also holding senior posts in the Central Committee and possibly in the Politburo, where policy is ultimately decided. In East Germany, the key agency of the military system appears to be the Commission for National Security, a dependancy of the Politburo, of which Erich Honecker is Chief. He is also Secretary of the State's superior military policy-making body, the National Defence Council (of which Stoph is Chairman), but the routine work of his Politburo Commission is carried out by the Security Department of the Central Committee of the Party (of which Stoph is again Chairman and Honecker First Secretary).

This elaborate mechanism is designed to ensure strict party control over the workings of the army as an institution of the State and to check in it any tendency towards autonomy. Political control of the personnel of the army is organised through a different network. The S.E.D. runs party branches in every army unit, to which virtually all officers belong, and these are subordinated to a branch (the Chief Political Administration) of the Ministry of National Defence which in another guise is a regional directorate of the party. The Free German Youth (FDJ), the party's youth organisation, likewise runs branches for soldiers, to which about 80% of them belong, and answers eventually to the Central Committee and Politburo.

World Armies

Political control of the army is, however, further extended and complicated by the system of so-called Politorgans and political officers. These *commissars* (in Western idiom) are appointed to each unit down to battalion and company, and answer to the Chief Political Administration. Their powers, however, do not extend to interference in military decision, that right being withdrawn from the Russian political officers, on whom they are modelled, in 1942.

The units and the personnel of the N.V.A. are supervised, therefore, with a strictness and thoroughness unknown and probably intolerable to Western soldiers. Control, moreover, is not merely passive; because political education (4 hours weekly for soldiers; 8 hours monthly for officers) is compulsory, the party exercises through that medium a positive check on the political motivation and enthusiasm of all service personnel. An even more positive check is provided through the surveillance of the Ministry of State Security; it maintains a liaison officer in every formation and unit down to battalion level besides, it is authoritatively reported, running a network of clandestine informers throughout the services at every level. They report to one of the main branches of the Ministry of National Defence (the Administration 2000) which is in effect an office of the Ministry of State Security, reporting to its own minister, and through him back to the Politburo. It is also believed to be in liaison with the Russian K.G.B.

The formal staff structure of the N.V.A. is unlike that of a Western army. Because the Nuremberg Tribunal declared the German General Staff a criminal organisation, it has none in the orthodox sense. The field force is commanded directly by the Minister of National Defence (together with the navy and air force combat units) as are the Administrations (British 'Directorates') of the various arms — artillery, armour and engineers — and certain specialised departments like the (excellent) military publishers, the military prosecutor and the Sports and Technology Association. The Main Staff, which approaches most nearly the status of a Western General Staff, is one of five principal sub-divisions of the Ministry of National Defence (excluding the air force and navy sub-divisions) which are headed by Deputy Ministers. Two of these are supply and procurement branches, one is the training branch, another the Chief Political Administration already mentioned; the last is the Main Staff, whose duties are operational planning, intelligence, control of signals and the co-ordination of communications with the Warsaw Pact networks, finance, recruitment and records. It thus approximates to the 'A' and 'Q' branches of a British General Staff, or the G-1, 2 and 4 of an American General Staff, without its G (British) and G-2 (American) elements. The oddity of the arrangement is explained by the Soviet's resolve to keep operational control of the N.V.A. above that of all the satellite armies in its own hands.

Operationally, the N.V.A., it is believed, would be commanded thus: the three divisions of Military District V would come under the orders of the Commander of the Soviet Group of Forces in Germany, which has its H.Q. at the old German Army Headquarters at Wuhndorf-Zossen; the three divisions of Military District III would come under the orders of the Soviet Commander of the Northern Group, headquarters at Liegnitz, Poland.

The Frontier Troops (H.Q. Plauen, near Karl Marx Stadt (Chemnitz)) are also directly controlled by the Minister. The paramilitary forces, including the combat groups, are under the orders of the Regional Commands (*Bezirk-Kommandos*) of the People's Police, answering to the Police Praesidium in Berlin-Basdorf.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

The N.V.A.'s original role, in the words of an expert, was 'outwardly to be a symbol of the sovereignty of the German Democratic Republic and . . . a countermeasure to the *Bundeswehr*. Inside East Germany it was to be accepted by the population as a continuation of traditions and to serve as a reliable support for the regime'. Since 1965 (at the latest) the N.V.A. has belonged to the First Strategic Echelon of the Warsaw Pact, that group of forces earmarked for immediate operations in the event of military conflict with NATO in central Europe. Its field force is sufficient to form two Soviet-style armies (equivalent to NATO corps), a grouping to which the Pact allows independent operational status, but it is more likely that it would operate as two groups of three divisions within a Soviet front (equivalent to a NATO army group) under direct Soviet command. The Frontier Troops of the N.V.A. would provide its covering force in wartime; in peace their role is that of preventing free passage across the DDR's borders in any direction. The role of the other paramilitary and security forces includes the deterrence and suppression of internal disorder, the provision of counter-weights to the army and the militarisation of the population for political ends.

Commitment

Unlike the field force of the *Bundeswehr*, which is wholly committed to NATO, the N.V.A. remains in theory an independent national army. In practice, however, Soviet control is probably absolute.

Deployment

The six divisions of the field force are stationed in two military districts: III (Leipzig) and V (Neubrandenburg). The remaining operational units come directly under the Ministry of Defence's headquarters at Strausberg, east of Berlin. This

deployment produces a heavy concentration of military strength in the northern and southern districts and around Berlin, but little in the central area. The Magdeburg district contains no N.V.A. unit, though across it runs the direct route to Berlin from the West. However, of the 10 frontier brigades (*Grenzbrigaden*) of the Frontier Troops Command, six are deployed in the West German frontier and three around West Berlin (of the remainder, one is assigned to coastal duty under naval command and two independent regiments patrol the frontiers with Poland and Czechoslovakia).

The 21 Alert Units (*Bereitschaften*) of the People's Police are deployed one to each of the 14 Districts (*Bezirke*), with one extra in Magdeburg, Halle, Leipzig and Potsdam, and these are under the control of the Police Praesidium in Berlin-Basendorf.

The Hundreds and Battalions (General and Heavy) of the paramilitary 'Combat Groups of the Working Class' (*Kampfgruppen der Arbeiterklasse*) are centred on the populated areas which provide their membership; likewise the Basic Organisations of the Sport and Technology Associations and the Order Groups of the Free German Youth (F.D.J.).

Military Districts (Armies) Each contains two motor rifle divisions and one armoured division (all on the Soviet establishment), together with army troops: one artillery regiment, one air-defence regiment, one signals regiment, one artillery-locating regiment, one engineer battalion, one anti-tank battalion, one transport battalion, one nuclear-chemical warfare company and one (non-operational) NCO training regiment. The units of Northern Army (H.Q. Neubrandenburg) are stationed as follows: 1st and 8th Motor Rifle Divisions, Potsdam and Schwerin; 9th Armoured Division, Eggesin; artillery and artillery-locating regiments, anti-tank battalion and NCO training regiment, Torgelow; air-defence regiment, Prenzlav; signals regiment, Neubrandenburg; engineer and transport battalions, and nuclear-chemical company, Pasewalk. The units of the Southern Army (H.Q. Leipzig) are stationed as follows: 4th and 11th Motor Rifle Divisions, Erfurt and Halle; 7th Armoured Division, Dresden; artillery, artillery-locating, air-defence and signals regiments, Leipzig; anti-tank battalion, Wolfen; transport battalion, Cottbus; engineer battalion, Gera; nuclear-chemical company, Grossenheim; NCO training regiments, Eilenberg.

The Ministry of Defence troops (H.Q. Strausberg) are stationed as follows: guard regiment, Eggersdorf; signals regiment, Niederlehme; railway construction regiment, Doberling; engineer regiment, Storkow; transport regiment, Strausberg; rocket brigade, Bruck; bridging and electronic-warfare regiments, Dessau; parachute battalion, Prora (on the island of Rugen — this appears to be trained for 'special forces' operations rather than as an air-landing battalion).

Recent Operations

Two divisions of the N.V.A. took part in the Soviet invasion of Czechoslovakia in 1968, under close Soviet control. They were not deployed in the populated areas and appear to have returned home after 5 days. N.V.A. divisions have taken part in the following major Warsaw Pact exercises: Quartet (October, 1963); October Storm (October, 1965); Moldau (September, 1966); Oder-Neisse (September, 1969); and Comradeship-in-Arms (October, 1970).

ORGANISATION

Arms of Service

Being a new creation, the N.V.A. has a corporate organisation uncomplicated by traditional or sentimental factors. The main branches are: infantry (*Infanterie*); armour (*Panzer*); artillery and rocket troops (*Artillerie und Raketentruppen*); engineers and technical troops (*Pioniere und Technische Truppen*); signals (*Nachrichten*). These are known as the 'operational' troops. The 'rear-service' (*ruckwartige Dienst*) are procurement, supply and transport troops. The medical and administrative services are also separate, as is the political service (officers only).

Operational

The operational organisation of the N.V.A., like that of all satellite armies, is patterned exactly on that of the Soviet army (*q.v.*). The only difference is that some of its artillery and armour is of an older pattern than in the first-line Soviet units.

The organisation of the Frontier brigades, each about 4000 strong, is unclear. Each is motorised and equipped with 250-300 light machine-guns and anti-tank missile launchers, and some light armoured vehicles (BTR-40s or BTR-152s).

The Alert Units of the People's Police are organised as battalions with three motorised and one APC company, a heavy weapons company and a headquarters company. The four battalions of the Guard Regiment of the Ministry of State Security are similar.

The Combat Groups form either general or heavy battalions (the latter are also known as Battalions of the Regional Reserve). Each is organised into three to four hundred, of three platoons of three sections. The heavy battalions, of which about 130 exist, are motorised and have some mortars and anti-tank weapons.

The Sport and Technology Association is divided into regional unions (based on the 14 *Bezirke*, then into district unions (based on the *Kreise*), then into basic organisations, centred on factories, agricultural enterprises and schools.

World Armies

RECRUITMENT, TRAINING AND RESERVES

Recruitment

Until 1962 the army was voluntarily recruited, in the early days largely from ex-officers and soldiers of the *Wehrmacht* who, having been identified as sympathetic to the S.E.D. through their having joined the Free Germany Committee or the anti-Fascist schools in prison camp, were released directly from captivity into the People's Police. About 40–50% of N.V.A. soldiers are still volunteers but, by act of the *Volkskammer* of January 24th, 1962, universal conscription applies in East Germany and conscripts are enrolled in all three services (including the Frontier Troops). The term of service is 18 months; would-be regulars enlist either for 'short' (3 year) or 'career' (12 year) service, but must first complete their 'basic' 18 months. But despite the notional 'universality of conscription', the full contingent is not recruited each year, and about 45% of the N.V.A. are regulars. The right of conscientious objection is partially recognised; those who refuse to bear arms because of 'religious or similar views' are conscripted into construction units (*Baueinheiten*).

Officers, originally ex-members of the *Wehrmacht* or veteran communists with military experience, are today recruited directly from secondary schools (in which case they are exempt from 'basic' service) or else are chosen from suitable conscripts or serving volunteers. School entrants must show university-entrance qualifications. Officers enlist for 10 years, the age limits for service in each rank being: captain, thirty-five; major, forty; lieutenant-colonel, forty-five; colonel, fifty; major-general, sixty-five. The N.V.A. takes pride in its claim that it now has an officer corps largely 'proletarian' in origin.

Training

Conscripts are called up (and released) twice a year, at the beginning of December and June. Their first 4 weeks are spent in a 'recruit unit', where they learn drill and discipline; at the end of it the recruits are received into their operational units with considerable ceremony. At a parade of the whole regiment, where the band plays, each swears on the colour a long and solemn oath binding him to serve the DDR, to preserve the Soviet alliance and the cause of Socialism, and to give unconditional obedience to his superiors, under pain of 'harsh punishment . . . and the contempt of the working people'. He then receives his personal weapon from a member of the local Combat Group, an act intended to symbolize the bond between the proletariat and the People's Army, and listens to an address by a local party official. A full member of his regiment, he next proceeds to 'individual' and then 'section' training in weapon handling and minor tactics; in the subsequent training periods of each of his 'military half-years' he acquires skill on a second weapon and in using a wireless set. When sufficiently trained, he takes part in the 'unit' and 'formation' training his regiment undergoes, at the appropriate stage of the 'half-year'. The emphasis of the training, as in all Soviet-bloc armies, is on offensive and night-fighting operations. Conscripts spend much time out of doors and, like all citizens of the DDR, are expected to attain very high standards of physical fitness. About a quarter of all training time is devoted to political indoctrination under the unit's political officer.

Frontier troops, selected for their political reliability, spend their first 6 months in special training units, where they are further screened by State Security, and receive 'border training' and intensive political indoctrination.

NCOs selected during their first 'half-year' of training, are sent either to the NCO training regiment of their military district (III — Eilenburg; V — Torgelow) or, since room does not allow for all, to the NCO training company of their unit. The emphasis of training seems to lie rather on the technical than the man-management side, the object being to produce a man who can look after equipment, rather than lead men.

Since 1963 officers have been trained at the Ernst Thälmann Officer School at Lobau, near Dresden. The course lasts 4 years and is run on Soviet lines, with a high emphasis on military theory and much political indoctrination; the military training is designed to fit graduates for command of a platoon. Final examinations are deemed equivalent in standard to those of higher civilian schools and qualify graduates for careers in civil administration should they leave the army.

Frontier troops officers are trained separately at the Rosa Luxemburg School at Plauen, the course lasting 3 years.

Scientific and technical officers are sent to study at the civilian engineering college at Berlin-Lichtenberg, while its civilian graduates are eligible for direct commissions.

Medical officers are commissioned directly from the Department of Military Medicine at Greifswald University, near Rostock.

Higher military training of officers of colonel and equivalent rank of all three services is at the Friedrich Engels Military Academy at Dresden (founded January 5th, 1959 and named after 'the co-founder of Marxism and first military theoretician of the working class'). The course lasts 2 years, is modelled on that of the Moscow Frunze Academy attended by several of the N.V.A.'s most senior officers, and is conducted at regimental/divisional level, its diploma being deemed equivalent to a university degree. (It is believed those officers promoted to general rank go for 2–3 year's training in Russia.)

The training of political officers, concentrated at a school at Treptow until its closure in 1961, is now conducted at special courses. The original brand of political officer, like his Soviet counterpart, caused much offence to commanders by reason of his military inexperience; political officers are now recruited solely from the active army.

For a short time the N.V.A. ran a cadet school, modelled on the Soviet military boarding schools, but it was closed in 1956 'to reduce the danger of the separation of the officer corps from other functionaries'.

Reserve

The military obligation extends from the age of eighteen to fifty for soldiers and to sixty for officers. The reserve is divided into two groups, the first of men up to thirty-five, on which the combat units would draw, the senior of older men who would staff rear services. Reservists are liable for reserve training of twenty-one months, spread over several years. The 'surplus' — those men not conscripted at eighteen because numbers exceeded requirements — are also liable for training as reservists on the same terms as ex-conscripts. Party functionaries, skilled workers and students, who are largely exempted from conscription, are particularly required to perform this sort of reserve training; party functionaries are then granted military rank commensurate with their political status. The strength of the effective reserve is calculated at 200,000 but might be as high as 350,000.

EQUIPMENT AND ARMS INDUSTRY

The DDR has no arms industry to speak of — a deliberate measure of Soviet control — and produces only small arms (copies of Soviet models), signal and optical equipment, transport vehicles and components. The equipment authority of the N.V.A. is the Department of Special Requirements of the State Planning Commission, headed by a major-general. It works in co-operation with the Research Council, the State Secretariat of Research and Technology and the Council of the National Economy.

Equipment of Soviet design manufactured in East Germany includes the army's 9mm Makarov pistol, the AK-47 assault rifle, the 7.62mm light and medium machine-guns, the 82mm and 120mm mortars, and the RPG-7 and SPG-9 light anti-tank missiles. There is a light mortar, the S-53 of East German design and manufacture. Otherwise, all material is imported from Russia so that the army's equipment, like that of the other Warsaw Pact armies, is standardised on Soviet models.

RANK, DRESS AND DISTINCTIONS

Ranks and Their Badges

Officers

Armeegeneral	Four stars on woven gold and silver shoulder straps
Oberstgeneral	Three stars on woven gold and silver shoulder straps
Generalleutnant	Two stars on woven gold and silver shoulder straps
Generalmajor	One star on woven gold and silver shoulder straps
Oberst	Three stars on woven silver shoulder straps
Oberstleutnant	Two stars on woven silver shoulder straps
Major	One star on woven silver shoulder straps
Hauptmann	Four stars on flat silver shoulder straps
Oberleutnant	Three stars on flat silver shoulder straps
Leutnant	Two stars on flat silver shoulder straps
Unterleutnant	One star on flat silver shoulder straps

Soldiers

Stabsfeldwebel	Three stars on grey shoulder straps edged with silver
Oberfeldwebel	Two stars on grey shoulder straps edged with silver
Feldwebel	One star on grey shoulder straps edged with silver
Unteroffizier	Silver edged shoulder strap
Stabsgefreiter	Two stripes on shoulder strap
Gefreiter	One stripe on shoulder strap
Soldat	—

Dress

Successive changes in the style of the N.V.A.'s dress provide one of the clearest examples of how deep and subtle is the significance — symbolic and ideological — of a national military uniform. The Barracked Police originally wore police blue. In 1952, however, on the party's unveiling of their military status, they adopted uniforms of Soviet colour and cut. These proved unpopular both with their wearers and, more importantly, with the East German population, and in 1956 therefore, on the official declaration of the N.V.A.'s existence, a uniform almost indistinguishable from the *Wehrmacht's* field-grey (itself descended from the combat dress of World War I and preserved by Seeckt during the years of the Hundred Thousand Man Army as a promise of renaissance), was introduced. The colour chosen, stone-grey (*steingrau*), was slightly

World Armies

different and the helmet adopted was an experimental model of 1944 rather than the notorious coalscuttle, but in almost every other respect, including such details as badges of rank, it echoed exactly the garb of the past — the past of the Hitler years as much as of the Second Reich. This required political justification and in his speech proclaiming the existence of the new army Stoph was at pains to offer it. 'There are important progressive traditions in the military history of our people, which found their expression in the uniform,' he argued. 'German imperialism and fascism . . . degraded (it) as a symbol of military and national honour . . . In the National People's Army, the German uniform will have a true patriotic meaning as an expression of resolute readiness for the defence of our democratic achievements. In these uniforms, but with red armbands, the armed workers in 1918 chased out the Kaiser; the Hamburg workers, miners from the Ruhr, workers and peasants from Saxony and Thuringia fought against the Nationalist *Freikorps* and the reactionary *Reichswehr*. In these uniforms in World War II many officers and soldiers came forward in the National Committee 'Free Germany' against the Hitler Fascist Army.' However disingenuously this speech reads, it does seem that the S.E.D.'s decision to revert to the traditional uniform has been a successful one in endearing the N.V.A. to the people. However, recent changes in style, notably the abandonment of the old-fashioned high collar in favour of open lapels with a shirt and tie beneath, suggest that the leadership has decided that its use of the Seeckt-*Wehrmacht* style was too blatant an attempt to establish a false continuity.

Among other traditional uniform details worn are the facing colours (*Waffenfarbe*) of the different arms: Armour pink; Artillery red; Engineers black; Infantry white; Technical troops black; Signals lemon; Medical Corps dark blue; Rear Services dark green; Frontier Troops light green; Air Defence light blue.

Parachutists wear a light-blue beret. The Guard Regiment wears a traditional-style ribbon above the left cuff, reading *N.V.A. WACHREGIMENT* (the State Security Guard Regiment wears a similar one, reading *WACHREGT. F. DZIERZYNSKI*, the name of the founder of the Russian secret police). Bandsmen wear traditional silver 'swallow's nest' epaulettes, and officers carry *Wehrmacht*-pattern sabres on ceremonial parades and wear the old black and silver girdle. They wear a Nazi-style ceremonial dagger on formal occasions. The regimental colour of each regiment of the N.V.A. is a black-red-yellow tricolour, gold fringed, mounted on a traditional spear-headed staff, bearing the insignia of the State on a roundel encircled with the words 'For the defence of Workers' and Peasants' Power'.

Distinctions

The DDR awards many State decorations. Of the military, the most important are: the Scharnhorst Order, the Battle Order of Merit (three classes), the Medal of Comradeship in Arms (three classes), the Merit Medal (three classes) and the Medal for Faithful Service (three classes — 15, 10 and 5 years). Soviet medals won fighting against Germany in World War II may be, and are, worn by a (decreasing) number of senior officers; medals won in the *Wehrmacht* may not be worn (as they may in the *Bundeswehr*).

CURRENT DEVELOPMENTS

Perhaps the most interesting thing about the N.V.A. is that it should exist at all. The Russians, for the best of reasons, have a powerful fear of Germans in arms, and feel an apparently genuine anxiety over the existence of the *Bundeswehr*. Indeed they have always pretended that the N.V.A. came into existence only after, and because of, the *Bundeswehr*'s creation, and though examination reveals this pretence for what it is, it is difficult to produce explanations which are convincing to Western minds of Russia's foster fatherhood of the N.V.A. Economy is a more obvious one, and the desire to discipline East German youth another — though it is partially invalidated by the delay in the introduction of conscription. Perhaps the real reasons are less tangible: the view that East Germany required an army as proof to the world of her sovereign status; the ideological requirement for a State founded on the basis of 'struggle' to possess the means to fight (it is significant that all the satellite States possess armies as well as police forces); a suspicion that German militarism was so deep-rooted as to make any German regime which lacked its own army fundamentally 'illegitimate' in the eyes of its subjects.

Whatever their reasons, the Russians have nevertheless taken steps to see that the N.V.A. remains, proportionate to population, the smallest of the Warsaw pact armies (1 soldier : 170 citizens as against 1 : 150 in Poland; 1 : 100 in Czechoslovakia; and 1 : 70 in Bulgaria); in absolute terms it is the second smallest of all, only 10,000 stronger than that of Hungary, which has only 10,000,000 instead of 17,000,000 people. They have also provided domestic counterweights to it, in the form of large security forces under the control of the Ministries of the Interior and State Security, numbering 70,000, and of the Combat Groups. Although much political emphasis is laid on the popular ownership of the Peoples' Army and its warm relationship with the proletariat, the existence of these independent forces, standard as they are to communist regimes, testifies to the S.E.D.'s and the Russians' fundamental lack of trust in the subservience of any German army.

It appears, nevertheless, that the N.V.A.'s real concern is with professional efficiency and not with any political role it might choose to play in the future. Militarily, it is an efficient, well-trained and well-equipped army. Its NCOs are said to lack the status necessary to their rank, a problem common to modern conscript armies, but the motivation and quality of the officers appears quite satisfactory and the morale of the soldiers adequate. As a body, the army is over-supervised, the influence of the S.E.D. being too intrusive at every level for comfort, while the senior ranks are filled with men whose

German Democratic Republic

political dependability probably exceeds their military talent; but this apart the N.V.A. must be reckoned a useful component of the Soviet-bloc forces.

JOHN KEEGAN

GERMAN FEDERAL REPUBLIC

HISTORY AND INTRODUCTION

The role of the army in the history of Germany has been more important than that of any other major State's. For united Germany — the Second Reich of 1871, of which the West and East German States are the successors — was the product of a military alliance transformed into a political federation through the victories of confederated armies. Their head, the Prussian King and German Emperor, owed his rise to primacy over his princely rivals almost wholly to the pre-eminence of his soldiers.

Professionally, moreover, Germany's army has played a leading role among the world's military institutions comparable to that taken by her universities in European and American academic life: it has offered a model of excellence which has had a world-wide influence. Not only was the Prussian *Kriegsakademie* (founded on the same day in 1810 as its neighbour, the University of Berlin) to become the prototype of all modern staff colleges; the General Staff which it supplied with graduates developed the division of duty and methods of work which all other staffs were to follow. The conscriptive system it administered, based upon the short-service enlistment in local units of all fit males, was also to set a pattern adopted by most States which either sought, or were compelled to compete in, the major military league (and which had important effects on their political and social evolution). While, in war, the German army time and again demonstrated an enviable capacity to hit upon a spectacular tactical or strategic solution of whatever problems with which unfamiliar technology or political adversity confronted it — in 1940 *blitzkrieg*, in 1870 the strategic use of railways, in 1810 the Krümper system of clandestine re-armament, in 1740 the battle-winning 'oblique order'. In every century since the eighteenth it has been the nursery of military prodigies — Frederick the Great, Gneisenau, Schlieffen, Guderian, Manstein, Rommel — and the throne-room of military titans — Blücher, Moltke, Frederick Charles, Hindenburg, Ludendorff — while at the beginning of the nineteenth century it produced, from the same intellectual climate which nurtured Hegel and Marx, the only universal philosopher of war, General Karl von Clausewitz.

Clausewitz, the Krümper system and the *Kriegsakademie* were each in their different ways distinctively Prussian, as in origin was much else that has come down into Germany's twentieth-century military system. But the Prussian army was only one among several which went to make up the army of unified Germany. Germany ununited possessed numbers; indeed the eighteenth century Germany of *Kleinstaaterei* could show almost as many armies as it could States, and while most were very small — perhaps only a single regiment maintained for show and hired out to a richer prince in order to defray the expense it cost its royal commander — some were sizeable: the Bavarian and Saxon were large enough to take the field independently. The history of these armies is often fascinating, most of all those which fought for the British in America and Spain or, as many did, for Napoleon in Russia; that of the Bavarian, which retained its independence even after 1871 and whose lively ghost could confront the Weimar Republic with the threat of military secession as late as 1923, is one of real significance in modern German affairs. But for the most part their history has been lost to view, submerged within the much larger story of the Prussian army, into which after 1871 they were physically incorporated (unless they had already been disbanded in penalty for choosing the wrong side in the Austro-Prussian War, like the Hanoverian which, as Wellington's King's German Legion, had written its own epic in Spain and at Waterloo and, going out in a blaze of glory, almost defeated the Prussian force sent to overawe it in 1866 at the battle of Langensalza). Thus the armies of Brunswick, Oldenburg and the Hansa towns survived after 1870 only as individual regiments on the Prussian list, that of Mecklenburg as a brigade, that of Hesse as a division and those of Saxony and Württemberg, the largest, as corps, their kings, by treaties of capitulation (an ancient word surviving from the days of mercenary warfare and signifying an agreement to hire troops) accepting the Prussian Crown's authority over their men in everything but honorific and ceremonial detail.

The story of the German army has been taken by modern historians to mean, therefore, that of the Prussian; and not without reason, for if looked at in terms of the law of natural selection it was the Prussian which proved itself, among the other species of army active in Germany, most successful at adapting to its environment. Its evolution, however, has been Lamarckian rather than Darwinian in character, a process of conscious self-improvement directed towards a concrete end: that of military and political primacy first within the Prussian heartland, next within Germany, then central Europe, ultimately over the continent itself. This is not to argue that Frederick William I looked forward to, or would even have approved of, the foreign policy of William II, still less of Hitler. His often quoted admonition to his son, the future Frederick the Great, 'You must not think about imaginary things; fix your mind on real ones. Have money and a good army,' were the words of a cautious husbandman of his fledgling State's resources, not of a would-be world conqueror. Even so, it was a matter of central satisfaction to him that he had made the difficult transition of status from '*roi mercenaire*' to one who could wage war '*nach eigener Conniventz*' — at his own convenience. And while the habit of waging war *nach eigener Conniventz* was certainly not uniquely Prussian, it was one in which the Hohenzollerns persisted longer than most, calculated their chances more finely and achieved the most spectacular run of success.

The Prussian army's evolution had effects in Prussia itself as well as on its neighbours. Through it the very nature of the State, and eventually that of Germany, was to be determined, while the process also exerted important influences on the development of German society as a whole. How this came to be is complex to explain, but if a single cause is looked for it will be found in the transformation of the Prussian nobility into an exclusive officer class, whose view of what place in society it should hold and what form that society should take, were equally inflexible. Originally a coterie of minor landowners, firmly planted in the soil of their small estates and looking to horizons no more distant than their own boundaries, they were successfully wooed from private and feudal concerns to public and military concerns by the efforts of a succession of rulers — the Great Elector, Frederick William I, Frederick the Great. This royal persistence was understandable, for if Prussia was to become an efficient centralised State the Crown needed both to break the selfish parochialism of the landowners and to provide itself with a loyal native bureaucracy, civil and military. To enlist the Junkers into royal service was, therefore, to catch two birds from the same bush; but in doing so, the crown was unwillingly creating an alternative centre of power within the State, and of a dangerously monopolistic character, for the Junkers quickly came to look on the apprenticing of their sons to the army not as a duty they owed the Crown but as one it owed them, and them alone.

As long as Prussia remained a simple monarchical State, as it did throughout the years (1740–86) when Frederick the Great was teaching its army the secret of invincibility, the special relationship between the officers and the Crown was a relatively harmless feature of its structure. The evil effects of the Junkers' monopoly was not to be grasped until military defeat (by Napoleon in 1806) had shaken the foundations on which the monarcho-military State had been based. That those who attempted to rebuild it on different (constitutional) foundations were themselves soldiers, e.g. Scharnhorst, Gneisenau and Boyen, disguised for a while the military caste's opposition to change. That it did not then or later resist some of the reformers' policies — those, for example, which made conscription genuinely universal or cast the army in the role of 'School of the Nation', further camouflaged its inflexibility. But its opposition to the recruitment of officers by competition, which would have substituted brains for birth as the selective principle, and to the creation of a popular militia (*Landwehr*) which would have been officered by the despised (and feared) *bourgeoisie*, revealed both its true attitude and the isolation of the reformers within their own class. The reactionaries' eventually successful counter-attack further revealed how superficial were the changes which the reformers did bring about: the *Landwehr* was reduced from a citizen force to the regular army's reserve and the lessons which the army (as the nation's schoolmaster) taught its conscripts was that of unbending obedience to the Crown.

However, the officer corps's victory did not end there. During the 'critical battles' for the future of Prussia (those of 1819, 1848, 1866 and 1918) it was the opponents of constitutional reform, liberation and democracy who were the most effective fighters, and they were usually either soldiers or their close allies. The liberals recognised whence their opponents drew their power: 'It is significant that the Prussian liberals in 1848 and in the years 1862–6 sought, first and foremost, to win control of the army, realising that control of the State would follow if this could be acquired. This challenge the leaders of the army met with highly effective political tactics. In 1848 they defeated the demand that the army should be bound by an oath to the new constitution (whose promulgation they had, however, failed to block), a dangerous exemption confirmed in all constitutional arrangements until 1919. In the so-called *Konfliktzeit* of the 1860s they effectively defied the right of parliament to influence (military) matters and further demonstrated that the army was responsible to the Crown alone. Finally, after the unification of 1871, when (parliament) sought to win . . . the right to question the War Minister, the army leaders adroitly deprived that official of most of his functions and relegated authority in all matters of command, organisation and personnel to utterly irresponsible army agencies. (Thus) until 1918 they were able successfully to block the introduction into Germany of . . . the minimal requirements of representative government, namely ministerial responsibility and effective parliamentary control over State administration and policy. Indeed even when the monarchy collapsed in 1918 and Germany acquired a republican constitution, the forces of resistance carried on their fight and were willing in the end, in order to destroy the democratic system, to place the fate of their country in the hands of Adolf Hitler.'

Not everyone would follow Professor Gordon Craig, magisterial though his authority on the subject is, to that final conclusion. The story of the German army up to 1914 is indeed one of its rooted opposition to change, exemplified by its preservation of the right of officers to be tried by their peers instead of by civil magistrates (hence the virtual abolition of courts-martial in today's *Bundeswehr*) and its (successful) efforts to transform middle-class officers, when at last they had to be admitted in numbers, into Junker facsimiles. But the attitudes of the army after 1918 were, it can be argued, quite as much, if not more, influenced by the experience it and Germany had undergone during World War I than by anything which had passed before, for that experience had been unprecedented and traumatic. Two million Germans had been killed, wide swathes of territory surrendered and the Kaiser dethroned. The vast wartime army had demobilised itself without its officers' permission, civil war had broken out in half a dozen German cities and provinces and the organs of government, such as survived, had been left for a time without the means to exert their authority or indeed even to protect themselves against common rioters, let alone dedicated revolutionaries. It was with these consequences that the German officer corps had to deal in 1918; to argue retrospectively from the accommodation to which it came with Hitler in 1933–4 that its aim throughout the Weimar years was to solve the problems of defeat by confiding them to a new strong man, does justice neither to its intelligence or the facts.

The army was indeed changed by the war just as was Germany itself. Obligated to recognise that the old monarchical State was doomed, less because of its obnoxiousness to the Germans than to the victorious Allies, it was the General Staff itself

World Armies

which presented the ultimatum to the Kaiser, in the hope that his departure would spare the country dismemberment and disarmament, and, when that proved unavailing, decided to take upon itself the duty of preserving national unity. Leaderless in a leaderless State, the army made itself in effect the new sovereign, holding itself 'above party' and pledged to intervene in the affairs of the Republic only if government should fail to preserve public order or compromise German sovereignty. This is not to say that Seeckt, creator of the 100,000 man army allowed to Germany by the Versailles treaty, liked the Republic, any more than did Field-Marshal Hindenburg, its president from 1925–34, while the feelings of their juniors was yet more tepid. All nevertheless served it dutifully enough to convince Hitler that he could seize its machinery only through the parliamentary process, and it was only after he had done so that the *Reichswehr* transferred their loyalties to him. That loyalty moreover, remained qualified, his demagoguery being distasteful to their fundamentally conservative instincts, and his adventurism in foreign policy alarming to the prudence they had learnt since 1914. If Hitler captured the army — and the evidence usually adduced is that of its passivity during the excesses of the 'blood purge' and its meek acceptance of his presidency in August, 1934 — he did so less by persuading its leaders that they and he shared common interests than by using against them the same mixture of threats, bribes and false alarms with which he had won German votes between 1930–33. Most potent of these threats was that to legalise the party militia, Röhm's SA, as an 'alternative army', most potent of his bribes were the largesse of promotions he conferred through the initiative of large-scale rearmament in 1935; most potent of the false alarms were the calumnies his henchmen laid against the army's leaders, Blomberg and Fritsch, in 1938. The mixture produced the effects Hitler had hoped for. The Röhm and the Blomberg–Fritsch affairs sapped the army's self-confidence, and rearmament's benefactions to individuals blunted its collective conscience. He took command and led it to war.

Whether, had his leadership continued to yield cheap victories after 1941, its conscience would have stirred again, is an unanswerable question. That stir it did in 1943–4, when a handful of regular officers of the pre-Hitler army glimpsed the loom of catastrophe, is well-known, as is the means they selected to avert it: the assassination of Hitler in his own headquarters. Their abortive tyrannicide was unsuccessful in both the short- and long-term. Immediately, it deprived the army of what was left of its independence, and paradoxically, by confirming the Allies' conception of it as 'a State within a State', it strengthened their resolve to deprive a reconstituted Germany of an army for good. East and West stood united in 1945 over that issue as over no other.

The reappearance of a (West) German army only 11 years after the 'permanent' demobilisation of the *Wehrmacht* is, in a sense, therefore, one of the most surprising events of the post-war world; in another, given the outbreak of the Cold War and the creation of a clandestine army in Soviet-occupied Germany, it is not surprising at all. By 1950 the British, Americans and French had convinced themselves, from a calculation of relative strengths, Russian intentions and the level of economic sacrifice their populations were prepared to make in the cause of collective security, that they could not maintain a credible land defence of the East–West border (manned at the time by only five divisions against 175 Russian in central Europe and European Russia) without German assistance. But the creation of a new *Wehrmacht* (*Bundeswehr* was the term eventually chosen) raised issues beyond the simply strategic. Not only was there the abrogation of inter-Allied agreements and the aggravation of Soviet mistrust to be considered. German rearmament raised in France (and not in France alone) anxieties almost as fierce as fears of Russian intentions, and in German liberals and socialists the spectre of a reborn 'State within a State', with all the threats to the safety of democracy that entailed, and of a remilitarised (by which they understood 'rebrutalised') society. Many Germans, moreover, though not specifically hostile to rearmament, disliked the prospect, because it conflicted with their passionate desire to lead quiet private lives after three decades of turbulence, an attitude summarised as '*ohne mich*' ('count me out'). The *Bundeswehr*, it was clear, would have to be a very different army from any that Germany had known before. It would have to be commanded by a supranational authority; it would have to be wholly subordinated to the civil power; and it would have to make itself acceptable to a generally apathetic but, in parts, actively antipathetic population.

The difficulty of finding ways to meet the first two of these aims (the third is not yet wholly achieved) meant that the raising of the *Bundeswehr*, from conception to institution, was to take 6 years. The external difficulties took longest to overcome. The first solution, proposed by France and endorsed by Winston Churchill in August, 1950 was for a European army, under a European Defence Minister, into which German units could be drafted without it being necessary to raise a German army at all. In negotiation the European army became a Defence Community (E.D.C.) and the European Minister a board of nine commissioners, supervising divisions, instead of the battalions originally proposed as the largest homogeneous units. But so smoothly did agreement grow, that the Allies meantime unilaterally abolished their control commissions, ended the state of war and recognised West Germany as a sovereign State. These diplomatic measures were contained in a Treaty of Bonn, signed in May, 1952, with the military agreements in a Treaty of Paris, signed the following day, the force of the former being conditional upon the ratification of the latter by all parties. In France its debate in the Assembly was delayed until August, 1954 and, for a variety of reasons, it then found insufficient support. This created an awkward situation. Although the Treaty of Bonn had been signed conditionally, the non-communist world had for 2 years treated the Federal Republic as if it were fully sovereign, and there was now 'little except good faith to prevent the Germans rearming' particularly as their government knew that America had wished that they should, ever since it had been decided that their help was needed. As Britain had greatly contributed to the delay in framing the terms of the E.D.C., and thus postponed French ratification of the Treaty of Paris, it was up to her to retrieve the situation, which she did by proposing the formation of a Western European Union (W.E.U.), to include Germany and Italy. The establishment of this body,

largely consultative though it has to be, generated the diplomatic goodwill necessary for the admission of Germany to NATO, and provided the Federal Republic with the occasion to limit voluntarily the military contribution it would make to the alliance to levels acceptable to France and the lesser powers. As specified in the Paris Agreement of October, 1954, these limitations included the renunciation of the right to manufacture biological, chemical and nuclear weapons, or to alter her boundaries or seek re-unification of Germany by force. The size of the German army was fixed at twelve divisions, of the air force at 1000 combat planes, all of which would be assigned to NATO and commanded by SACEUR.

Meanwhile, the Federal government had gone some way to settle the internal political difficulties attendant on rearmament. An 'Office of the Commissioner of the Federal Chancellor for Questions Connected with the Increasing of Allied Troops' (called the Blank Office after its first and only incumbent) had been set up in October, 1950. It had two main tasks: the formulation of an 'idea of the Bundeswehr' and the preparation of the legislation which would transform idea into reality. Foremost among the ex-officers to advise Blank was Graf Baudissin, with whom is associated the development of the 'Stadtsbürger in Uniform' (Citizen in Uniform) concept on which the *Bundeswehr* was to be built. He summarised its sense in these words, 'The inner structure of the armed forces in a free society must be such that young soldiers can complete their military training without fundamental break with their civilian environment.' An end then, to separate military courts and to 'sergeants' rule' (bullying and beating, characteristic of the Prussian army). The Basic Law (the constitutional Foundation of the Republic enacted in 1949) was to govern the army, its soldiers were to be guaranteed their constitutional rights and they and their officers were to be taught a view of the soldiers' and leaders' role through a scheme of 'Innere Führung' (moral leadership). And to see that Parliament's and Society's will in these matters was enforced, there were to be a Parliamentary Defence Committee with permanent powers of enquiry, and a Defence Commissioner (*Wehrbeauftragter*) (based on a Swedish example): to him all members of the forces were to have the right of direct, confidential appeal in matters of basic constitutional rights.

This protection of the citizen's rights was vital if the *Bundeswehr* was to commend itself to the population of the Republic, for it had been early recognised (though not by Colonel von Bonin, first Chief of Planning, who advocated a small all-volunteer force) that it would have to be conscriptive. The government also hoped, by assuring parliamentary control and the soldier's constitutional rights, to make the establishment of the *Bundeswehr* bi-partisan in policy. In that it failed. The SPD (Socialist party) assented to several of the defence bills of 1954-7, in particular the one which set up a Screening Commission to exclude undesirable officers (and which rejected several members of the Blank Office) at the office of the Defence Commissioner, but it opposed almost all the others. Nevertheless the necessary acts were passed (*see* Command and Constitutional Status). In July, 1955 the first volunteers were recruited and in January, 1956 the first units established. In July half of the Federal Border Guard, created by the Adenauer government in 1950 to emphasise to the Allies Germany's defencelessness, was integrated, and in April, 1957 the first 10,000 conscripts were inducted. By 1960, the *Bundeswehr* numbered 256,000, of which 158,000 belonged to the army, organised into seven divisions. Progress towards its full strength of 12 divisions, reached in 1965, proceeded smoothly. Considerable expenditure in armaments have subsequently made them the best equipped of all on NATO's Central Front. Militarily, the German army is again a formidable force; politically, it remains suspect to a minority of the Republic's citizens. The majority appear to accept that the danger of its becoming 'a State within a State' are effectively checked by the severe constitutional restraints in which it operates. The army itself carries no aspiration to any such status.

STRENGTH AND BUDGET

Strength

Population: 63,200,000 (including West Berlin)
 Army: 340,000 (conscripts 180,000)
 Navy: 38,000; 154 vessels (mainly small craft)
 Air force: 110,000; 509 combat aircraft
 Paramilitary forces: 20,000 Federal Border Police and 15,000 *Länder* Alert Police
 Reserves: army, 615,000; navy 27,000; air force 85,000
 Territorial Army: 441,000

Budget

The defence estimate for 1978 was about DM35,000,000,000, DM2,100,000,000 more than in 1977. The cost of the army is not shown separately. Nevertheless, some published information throws light on it: in 1973 the operating cost of an armoured brigade (equipment procurement cost DM250,000,000) was DM82,300,000, of which DM59,000,000 was personnel costs; the operating cost of an armoured infantry brigade (equipment procurement cost DM260,000,000) was DM82,800,000, of which DM57,200,000 was personnel costs; the operating cost of an infantry brigade (equipment procurement cost DM165,000,000, was DM76,100,000 of which DM56,300,000 was personnel costs. At the same time it was calculated that the annual personnel cost of an officer, and NCO and a conscript private was DM36,300, DM23,570 and DM11,660, respectively. The total cost of the Federal Border Guard in 1973 was DM604,800,000.

World Armies

COMMAND AND CONSTITUTIONAL STATUS

Command

Control of the armed forces is divided between the parliament and the executive. Parliament (the *Bundestag*) is responsible for defence legislation, the military budget and, when necessary, the declaration of a state of war (*Veteidigungsfall*). Two investigatory agencies work to it: the Defence Committee, composed of members of parliament, which has the powers of a parliamentary committee of enquiry, and the Defence Commissioner, whose role is to assist parliament in exercising its supervisory powers and to protect the constitutional rights of citizens while they serve in the armed forces. The executive's powers are divided. The Federal President is, unusually, not titular commander-in-chief; his powers are limited to the appointment and dismissal of civil and military officers, the regulation of the system of ranks and design of uniforms; and the proclamation of a state of war. The Federal Security Council, a Cabinet committee to which the *Bundeswehr* Chief of Staff belongs, co-ordinates the direction of defence affairs. The Federal Minister of Defence is Commander-in-Chief of the *Bundeswehr* in peacetime, and responsible for its management. He is assisted by a junior minister (Parliamentary Secretary) and two State Secretaries, one for administration, the other for armaments. To him work directly the five senior Chiefs of Staff: *Bundeswehr*, Army, Navy, Air Force and Medical Service. Each of their staffs is organised into seven sections: I Personnel and Training, II Intelligence, III Operations, IV Organisation, V Logistics, VI Planning and VII Communications, Electronics and Weapon Development. For historical reasons (the condemnation of the General Staffs of the Wehrmacht and the Army as criminal organisations by the Nuremberg International Military Tribunal) the Chiefs of Staff are entitled *Inspekteure* (e.g. *Inspekteur des Heeres* — Chief of Staff of the Army) and their staff as *Führungsstab* (e.g. *Führungsstab des Heeres*).

Operational command of the army is exercised, moreover, not by any organ of the German government or *Bundeswehr* but by NATO officers. The chain of command runs from SACEUR (an American Officer) to Commander, AFCENT and through him to the Commanders CENTAG and NORTHAG. The former commands, with other NATO forces, II and III (German) Corps and the latter I (German) Corps. Command of the 6th *Panzer* Grenadier Division in Schleswig-Holstein is exercised by Commander AFNORTH under SACEUR. Thus the highest national level of operational command in the German army is at Corps headquarters. Command of the Territorial Army is in the hands of the minister, however, together with that of the General Army Office and of *Bundeswehr* installations.

Constitutional Status

The Basic Law (*Grundgesetz*) on which the Federal Republic was founded said almost nothing about the status of its army, not unnaturally since none existed at the time (1949) nor was envisaged for the future. It did not, however, prohibit the raising of an army (as it did the waging of aggressive war) so that when, in 1956, the Federal Government proceeded to create one it found no serious legal impediment to its so doing. Given the strict protection of the rights of the individual enshrined in the Basic Law, however, and the hostility of the Socialist opposition party to, as well as international suspicion of, the rearmament policy, the government did find it necessary to pass a whole range of new laws and constitutional amendments defining the army's place in the Federal State and of the citizen's rights while in uniform. Of these the most interesting are: the Servicemen's Act, which stipulates, that 'he is to be instructed in the rights of the people of all nations according to international law' as well as in his own constitutional rights and responsibilities; the Military Penal Act, which lays down that the soldier remains under the jurisdiction of the civil courts; and the Military Appeals Act, which allows the soldier to lodge complaints and appeals to the civil courts. Thus the exemption of the soldier from the civil jurisdiction, the cause of multiple inequities in Imperial Germany, is forbidden. The enforcement of the new constitutional order is guaranteed, moreover, by the activity of the Parliamentary Defence Commissioner, the first of whom, Count Baudissin, firmly established the concept of the 'citizen in uniform' as the basis for relations between army and State (*see also* the first and the next sections).

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

This has been much debated (*see* History and Introduction, and Command and Constitutional Status) and is more closely circumscribed by domestic law and international agreement than most other armies. Like theirs, the German army's role is both external and internal: the protection of the national territory; and the maintenance of 'the existence (and) free democratic basic order of the Federation' (Article 91 of the Basic Law). By the Paris Agreements of October 23rd, 1954, by which the British, American and French terminated their occupation of West Germany, recognised it as a sovereign State, invited it to join NATO, and agreed to the creation of a German military force, the Federal government undertook to limit the size of that force to the maxima negotiated in the European Defence Community Treaty of May, 1952 (i.e. 12 divisions), to abstain from the manufacture of atomic, biological and chemical weapons, and to refrain from seeking to bring about the reunification of Germany or to alter the boundaries of the Federal Republic by forceful means. Command

of the forces whose raising was authorised by the Paris Agreements was to be vested in the Supreme Allied Commander Europe (SACEUR). These provisions defined the international status of the *Bundeswehr*, and they remain effective. Meanwhile the Federal government had to revise its own constitution to provide legally for the existence of the new national army. The Basic Law was virtually silent on the matter, containing only a guarantee of the right to refuse military service (Article 4), and a prohibition of the waging of aggressive war and reservation of the right to manufacture weapons (Article 26). Article 91 did permit the Federal government, however, to intervene in the affairs of the *Länder* for self-defensive purposes and amendments to that and others (notably 87, which allowed 'Federal frontier protection authorities' to be raised) provided the constitutional basis for the *Bundestag* to vote the amendments necessary to the creation of an army. But constitutionally the army may, in peacetime, operate only 'to protect civilian installations and to regulate traffic' and where the performance of its defensive mission requires (Article 17) or, in cases of emergency, when the police and *Bundesgrenzschutz* have both failed to suppress disorder and those causing it 'are organised and armed with military weapons'. In both cases a State of Defence (*Verteidigungsfall*) must previously have been proclaimed by the *Bundestag* by a two-thirds majority of those voting, which must represent a simple majority of elected members (Article 115). Thus German law limits the role of the army to that of (a) obeying the orders of a supranational commander (SACEUR) except when (b) parliament authorises its employment on the national territory for purposes strictly defined in nature and limited in time. The legal purity of this doctrine has been somewhat muddled by the creation of the Territorial Army (*see Organisation*) which is not assigned to NATO; but it too may only be employed operationally after a State of Defence has been proclaimed.

The operational doctrine (*Kriegsbild und Auftrag*) of the army conforms to that of NATO which since its birth has been explicitly based on 'forward defence' — the defeat of a Warsaw Pact attack as near the eastern border as possible, by the use of conventional forces in the first instances and by nuclear weapons only as a last resort. The German army is naturally less happy with the doctrine of 'flexible response' as a means of operating the 'forward strategy' which was instituted in 1967, since it suggests a willingness by NATO to surrender larger areas of German territory than most Germans would care to lose, as a means of postponing the moment when nuclear weapons would be employed — more of which would then explode on German soil. The German army therefore trains particularly seriously for the compensatory NATO plan to commit major conventional forces at or near the border and to wage an offensive defence.

Commitment

The field forces of the army are all assigned to NATO. The units of the Territorial Army act either as training or support units for the field army or as home defence units, which may be employed only when a 'state of defence' has been proclaimed. Germany is a member of NATO, of Western European Union and has bilateral agreements with the United States and with France (under which the French divisions are stationed in Baden-Württemberg).

Deployment

Because the territory of West Germany is, in effect if not in law, permanently organised for war, appropriate details are included under *Organisation*.

Recent Operations

The German army has taken part in no operations since its re-formation.

ORGANISATION

Arms of Service

The German army, having been rebuilt from scratch in 1956, has, as might be expected, a highly functional domestic structure. No attempt has been made to perpetuate or revive links with the regiments or corps of the past, as Seeckt tried to do after 1921; though individual infantry and cavalry/armoured units stationed in appropriate districts nevertheless unofficially adopt the identities of vanished Imperial regiments, the adoption of these fictional ancestries is heavily disfavoured by the Defence ministry.

The arms of service are:

1. Infantry (*Infanterie*) which includes armoured infantry (*Panzergranadiere*), light infantry (*Jäger*), mountain infantry (*Gebirgsjäger*), parachute infantry (*Fallschirmjäger*) and anti-tank troops (*Panzerjäger*).
2. Armour (*Panzertruppe*) which includes tank units (*Panzer*) and reconnaissance (*Panzeraufklärung*).
3. Artillery (*Artillerie*) which does *not* include the large tactical guided missile (Pershing) — units which are manned by the air force.

World Armies

4. Anti-aircraft Artillery (*Flugabwehrartillerie*) which does *not* include large surface-to-air missiles (Hawk and Nike-Hercules) — units which are manned by the air force.
5. Engineers (*Pioniertruppe*).
6. Signals (*Fernmeldetruppe*).
7. Army Aviation (*Heeresflieger*).
8. Technical Services (*Technischetruppe*), which embrace transport, supply, storage maintenance and repair units.
9. Medical Service (*Sanitätsdienst*), a tri-service body.
10. Nuclear-Biological-Chemical Defence Corps (*ABC-Abwehrtruppe*).
11. Military Police (*Feldjäger*).
12. Band Service (*Militärmusik*).
13. Intelligence Corps (*Frontnachrichtentruppe*).
14. Psychological Warfare Corps (*Psychologische Kampfführungstruppe*).

Operational

The army is divided into a Field Army (*Feldheer*) and a Territorial Army (*Territorialheer*). The Field Army consists of the major fighting units, which are earmarked for assignment to NATO in case of war. The Territorial Army would remain under national control even in time of war and consists of all the other army units, including the headquarters (*Heeresamt*) and all army schools, colleges and academies.

The Field Army is organised into three corps (I, HQ Munster; II, HQ Ulm; and III, HQ Koblenz) and an independent division (6 *Panzergrenadierdivision*) based at Neumunster in Schleswig-Holstein which works with the Danish army (*q.v.*). The corps control three to four divisions each; the divisions control three brigades each. There are 12 divisions in all (four armoured, four armoured infantry, two infantry, one mountain and one airborne — the latter's brigades distributed between the corps) and 36 brigades (16 armoured, 12 armoured infantry, three infantry, two mountain and three airborne). The divisional headquarters are:

- I Corps: 1 *Panzergrenadierdivision*, Hannover
3 *Panzerdivision*, Buxtehude
7 *Panzergrenadierdivision*, Unna
11 *Panzergrenadierdivision*, Oldenburg
- II Corps: 4 *Jägerdivision*, Regensburg
10 *Panzerdivision*, Sigmaringen
8 *Gebirgsdivision*, Garmisch-Partenkirchen
9 *Luftlandedivision*, Bruchsal
- III Corps: 2 *Jägerdivision*, Marburg
5 *Panzerdivision*, Koblenz
12 *Panzerdivision*, Würzburg

Each corps has a sizable complement of combat and support units, totalling about 50,000 men, about equal to the numbers in its subordinate divisions. The most important *combat* units under direct corps command are: the corps armoured regiment (two battalions — 110 tanks); the corps artillery brigade, with one 'Sergeant' rocket battalion (four launchers); one medium artillery battalion (18 155 mm SP howitzers) and two field artillery battalions (36 105 mm howitzers); one corps anti-aircraft regiment (90 40 mm guns); one corps engineer brigade with up to nine battalions of various types (heavy, bridging, etc.); one signals brigade with two signals and one electronic warfare battalion; one corps of aviation command (121 light and medium helicopters for observation and troop transport).

Each division (except the airborne) also directly controls a number of combat and support units. The most important of these combat units are: one divisional armoured reconnaissance battalion (50 APCs, 28 tanks); one divisional artillery regiment, with one heavy battalion (six 203 mm SP howitzers, 12 175 mm SP guns) and one rocket battalion (four Honest Johns, 16 110 mm multiple rocket launchers); one divisional anti-aircraft battalion (36 twin 40 mm); one divisional engineer battalion; one signals battalion; one divisional aviation squadron (12 light helicopters).

The Brigade, of which a division controls three, may be one of four types: (a) armoured, (b) armoured infantry, (c) infantry (*Jäger*) or mountain infantry and (d) airborne. The airborne division contains only airborne brigades; the armoured divisions contain one armoured infantry and two armoured brigades; the armoured infantry division contains one armoured and two armoured infantry brigades; the infantry divisions contain one armoured and two infantry brigades; the mountain division contains two mountain and one armoured infantry brigade.

The armoured brigade contains two tank battalions (108 tanks), one armoured infantry battalion (56 APCs) and one artillery battalion (18 155 mm SP howitzers); the armoured infantry brigade contains two armoured infantry battalions (112 APCs), one armoured battalion (71 tanks) and one artillery battalion (18 155 mm SP howitzers); the infantry (*Jäger*) brigade contains three infantry battalions (each of 18 APCs plus sufficient additional APCs or lorries to carry the remaining men), one tank destroyer (*Panzerjäger*) battalion (72 tank destroyers) and one artillery battalion (18 155 mm SP howitzers)

— in the mountain brigades the infantry are all carried in wheeled vehicles and the artillery battalion is equipped with 105mm pack howitzers; the airborne brigade contains three parachute battalions and light supporting units (airborne engineer company, anti-tank company, etc.) (all men in the airborne brigades are regulars).

The Territorial Army, whose main task is to defend the rear areas in event of war, is organised, as part of the Organisation for Territorial Defence (*Territoriale Verteidigung*), on a geographical basis, the boundaries of its sub-divisions coinciding with those of administrative areas with which it is in liaison. There are three Territorial Commands (*Territorial Kommando*): *Nord* — HQ Mönchengladbach, *Süd* — HQ Heidelberg and *Schleswig-Holstein* — HQ Kiel. At the next level downward, *Schleswig-Holstein* oversees Military District (*Wohrbereich*) I — HQ Kiel; *Nord* oversees Military Districts II (the Länder of Niedersachsen and Bremen — HQ Hannover) and III (Nordrhein-Westfalen — HQ Düsseldorf); *Süd* oversees Military Districts IV (Hessen, Rheinland-Pfalz, Saarland — HQ Mainz), V (Württemberg-Baden — HQ Stuttgart) and VI (Bavaria — HQ Munich). The Military Districts are sub-divided into Defence Regions (*Verteidigungsbezirke*) of which there are thirty, coterminous with one or more administrative districts (*Regierungsbezirke*) of the Länder, which are further sub-divided into 75 Defence Sub-regions (*Verteidigungskreise*), coterminous with one or more city or rural districts (*Stadt-Landkreise*).

The Territorial Army's combat units are of three sorts: (a) Home Defence Groups (*Heimatschutzkommandos*), of which one is in existence or planned for Military Districts II–VI (all have now been formed); (b) light infantry battalions (*Jägerbataillone*), of which 21 are in existence or planned for the Defence Regions; and (c) Security Companies (*Sicherungskompanie*), of which 300 are either planned for or are in existence in the Defence Sub-regions. The Home Defence Groups are effectively very lightly equipped infantry brigades of two motorised battalions, one engineer battalion, one anti-tank company and one heavy mortar company, numbers which can be doubled in emergency by the call-up of recruits; in peace each contains about 2500 men, of whom all but 15% are conscripts undergoing training. The light infantry battalions of the Defence Regions have a permanent cadre but are manned by reservists, who do 14 days' annual training; the battalions are motorised but would requisition most of their vehicles from civilian sources. The Security Companies of the Defence Sub-regions are entirely reservist in composition and based in the areas where their reservists live. The equipment of all these combat units is held at local centres manned by serving soldiers. The Territorial Army also contains numbers of engineer battalions, whose task is to create defensive obstacles and demolitions, as well as signal and supply units for the support both of the Territorial and the Field Armies. The corps depots of the Field Army are filled by units of the Territorial Army from depots administered by the Army National Command.

Besides these combat and support units, the Territorial Army nominally controls all other units, commands, agencies and schools of the army which are neither part of the Field Army or the Army Staff. In practice, the majority are administered directly by the General Army Office (*Heeresamt*) at Cologne (see Command and Constitutional Status), the principal subordinate headquarters of the Army Staff. It has dual responsibilities: as a subordinate headquarters of the Army Staff it is responsible for the organisation, training and logistical support of the Field and Territorial Armies, and the provision and maintenance of equipment; as Command Headquarters for Army Installations, it supervises the Army Officer School (Hannover), the 22 arms and service schools and the Army Material Command which holds and handles stocks for supply to units.

Reorganisation

Some minor reorganisation of the army's strength is in progress. It has increased the number of brigades to 36 (from 33) and will decrease the strength of battalions, so as to produce a larger element of corps troops. The size and number of the Territorial Army's units is to be increased. Armour and artillery units have now been added to its strength, equipped with older material now surplus to the requirements of the Field Army.

Paramilitary Forces

The Minister of the Interior controls the Federal Border Guard (*Bundesgrenzschutz* — BGS), established in 1950 under Article 87 of the Basic Law as a counter force to the East German *Grenztruppen*. It numbered 10,000 (since 1953 20,000) and is organised into four commands, which control several *Gruppen*, each of two to three battalions. The force is a fully motorised militarised police, equipped with light armoured vehicles (e.g. the BGS Sonderwagen, built by the Swiss firm MOWAG), mortars, anti-armour weapons, 20mm cannon and infantry small arms. Its role is limited to a strip 30km deep along the Federal border, unless its use is invoked under Article 91 of the Basic Law, which allows the Federal government, in the face of a threat to 'the existence or free democratic order' of the *Bund* or one of its constituent *Land*, to centralise police forces under its control. About half of the BGS was transferred to the *Bundeswehr* in 1956 to constitute its original units.

Each *Land* also controls a number of Police Alert Units (*Bereitschaftspolizei*). The Federal government requested the Western Powers in August, 1950 in view of the disturbed internal situation in Germany to permit the formation of a militarised Federal Police. The request was refused, but permission given for each *Land* to raise a barracked police (equivalent to the *Kasernierte Volkspolizei* already in existence in East Germany) to a strength of 30,000, which would in emergency quell disturbances. The *Bereitschaftspolizei* are organised in battalions of the same type as those of the BGS, and all German police recruits serve 2 years in one as a preliminary to normal duty. Under Article 91, these battalions may be placed under Federal control or that of another *Land* which has need of them.

World Armies

RECRUITMENT, TRAINING AND RESERVES

Recruitment

There are three forms of service: conscript, army-service regular and career regular.

The first members of the *Bundeswehr* were all regulars (Volunteer's Law of July 16th, 1955), many of them ex-members of the *Wehrmacht*, selected by a Personnel Advisory Committee appointed by the *Bundestag* with the concurrence of all parties (except the tiny *Deutsche Partei*). It admitted 6000 applicants, having rejected about 600 ex-soldiers. On July 6th, 1956 the *Bundestag*, however, had also passed the Conscriptive Law, which provided for the compulsory recruitment of annual contingents, initially for a period of 12 months. The period was extended to 18 months in January, 1963 and reduced to 15 months on January 1st, 1973. Until April, 1965 the minimum recruiting age was twenty, then eighteen, but in practice nineteen is normal. Deferment for those undergoing professional training is permitted as is the performance of shortened military service for certain categories of recruits. The legal right of conscientious objection is strictly preserved; initially, indeed, the legal difficulty was to make military service constitutional, for although the Basic Law establishing the *Bundesrepublik* did not prescribe remilitarisation, it so tightly enshrined a whole range of personal freedoms that the imposition of military discipline on citizen-conscripts, indeed even on volunteers, would have seriously infringed the law. Some 30 constitutional amendments had in consequence to be passed, many of them not without lengthy parliamentary tussles. Objections must be confined on conscientious grounds to all use of force as between States, but need not be religiously based. The objector is interviewed by a board of four, one appointed by the Minister of Defence, three by the *Land* in which he lives. If successful, he must perform useful social service for the full term of his service. The numbers applying were low during the first 12 years of conscription, about 3400 a year; 70% were university students or high-school graduates, and 80% applied successfully. In 1968, apparently as a result of the outbreak of student and youth dissent in many Western countries, the number jumped to 12,000 and reached 33,792 in 1972. Of the 1973 contingent born in 1953, 6.7% (27,589) about half of whom were high-school graduates, had filed objections by September 30th, a number 2.5% up on the equivalent period for 1972, and of these 2278 were already serving. There are now sufficient 'alternative service spaces' for successful applicants, and the Federal government intends to create an additional 20,000 by the end of 1974.

If the *Bundeswehr* were dependent wholly on conscripted youth for its recruits, and needed all that were available, the situation would be serious. However, even after objectors have fallen out, it has an annual class of over 300,000 from whom to choose and takes only about two-thirds, a practice which gives rise to a familiar complaint about the inequity of conscription. Its selectivity is determined by its need to fill many technical and command posts with regulars who form about 55% of the army's strength. This is 5% fewer than the army would prefer, but is adequate, though again the length of engagement for which regulars volunteer is shorter than the army would wish. Regulars may enlist for any term between 21 months and 15 years and, if promoted sergeant, may between the ages of twenty-five and twenty-eight apply for a career appointment guaranteeing employment to fifty-two, and thereafter a pension. There are about five times as many applicants as places for these career posts. Non-career posts are much more difficult to fill. There is a growing shortage of long-service privates (numbers declined from 85,000 in 1967 to 77,000 in 1973) and a steady 25% shortage of long-service NCOs on 3-15 year engagements, a shortage partially alleviated by the promotion of some conscripts to *Unteroffizier* (Sergeant) rank since 1969.

The shortage of NCOs is usually explained by an unwillingness in conscripts to afford heartfelt respect to men in a 'foreman' position, who are often less well-educated than themselves, and has been noted in many modern conscript armies, particularly the American. Officers, because they enjoy 'professional' status, are held to be exempt from it. Whatever the accuracy of the analysis there is yet a shortage of officers — an absolute shortage of 'long-service' officers and a shortage of 'career' officers in certain critical age-groups. (There are no conscript officers, except for some (1973: 1220) doctors, dentists or pharmacists.) The shortages are irritating rather than crucial, however, and at the second-lieutenant level are made up by the readiness with which conscripts selected for reserve-officer training volunteer for 2 year service, thus extending by 9 months their legal obligation; some sign on for longer. A number of specialist officers, who may be promoted up to the rank of captain, rise from the regular NCO ranks. But, in general, most officers are either (a diminishing number) former members of the *Wehrmacht*, or school-leavers who have been trained in the *Bundeswehr*'s own academies.

Training

Soldiers

The shortening of basic military service from 18 to 15 months has necessitated a simplification of the conscript's training. He is no longer given a preliminary training as an infantryman but, during his 3 months' basic training, begins at once to learn his individual skill — that of tank gunner, radar operator, etc. — though with some instruction in drill and self-defence. This is carried out in one of 15 Basic Training Units which form part of the Home Defence Groups of the Territorial Army. His remaining 12 months are spent in his operational unit, where he receives unit training, the syllabus for which is divided into four 3 month periods, which can be taught in any sequence (since any sub-unit will contain soldiers in their 2nd, 3rd, 4th or 5th 3 months of service). Thus unit training is a cycle which can be entered at any quarter of the year

and left 12 months later. The system naturally throws a considerable strain on the energy and intelligence of the junior officers and NCOs who must make it work, but it appears to be efficient.

NCOs

Future NCOs, selected if possible after 5–8 months' service, are trained first in their parent units, then at a 3 month Basic NCO course in the school of the Arm to which they belong. Of these the most important are: Infantry and Armour — Combat Schools I (Hammelburg), II and III (Munster); Artillery — Idar-Oberstein; Anti-aircraft — Rendsburg; Engineer — Munich; Signals — Feldafing; Military Police — Sonthofen; Army Air Corps — Buckerburg; Technical Corps — I (Aachen) and II (Bremen). There are besides some specialist schools: Paratroop (Altenstadt); Mountain and Winter Warfare (Mittenweld); Missiles (Eschweiler); NBC (Sonthofen); Engineer Construction Academy (Munich) and Machine Engineering School (Darmstadt). After three satisfactory years of service in the *Unteroffizier* rank, suitable candidates go forward to the Advanced NCO courses held at Sonthofen or Aachen (Army NCO Schools I and II). Each is then trained there for 6–33 months depending on the length of his engagement, both in his speciality and for eventual civilian employment in a related occupation, and is tested for suitability for promotion to career NCO or specialist officer.

The *Bundeswehr*'s new training and education policy, announced on January 18th, 1973, is to integrate its courses with those of the Federal education system so that specialist military training will automatically fit servicemen for civilian employment on discharge, a policy dictated by national economic requirements and the need to make military service more attractive. A corollary is that selection for training depends very much on the recruit's pre-service education — NCO training, for example, being the prerogative of men who have completed an apprenticeship or middle school. However, the *Bundeswehr* runs 31 vocational schools which provide both a 'second educational route' to advancement, for poorly educated recruits enlisting for 8 years or more, as well as 3 year courses in civilian skills open to all long-service and career NCOs on discharge.

Officers

Their system of training has recently been radically revised. Hitherto, all (reserve, short-service, long-service and career) have proceeded from basic military training of the sort undergone by conscripts to a short period of regimental service and then to Officer Candidate School at the school of their Arm, where after six months they took the officer examination. After that, short-service, long-service and career officers attended courses at one of the three Army Officer Schools (*Heeresoffizierschule*) at Hamburg, Hannover or Munich, and took a course whose length depended on that of their engagement. This system persists for short and long-service officers (under 12 years' engagement). Henceforward, however, career officers, and long-service officers engaged for 12–15 years, will proceed from Officer Candidate School to one of the two new *Bundeswehr* universities established on October 1st, 1973 by (a) the transformation of the Officer School at Hamburg and (b) by the fusion of the Air Force Technical Academy with the Army Officer School and one of the army's three technical colleges, all at Munich. Training at these universities will last 4 years and lead to the grant of a degree, the subjects for which are strongly scientific in character. It is planned that 400–600 student officers will be under training by 1976 (the majority from the army). After 8 years of commissioned service, officers are obliged to proceed to 'Grade C' education, meaning a long or short course at the Armed Forces Staff College (*Führungsakademie der Bundeswehr*) at Hamburg. Only about 85–90% are chosen for the short staff course, qualifying them for S1, 2, 3 or 4 posts (subordinate staff appointments). The remaining 10–15% do 2 years' training preceded by 4 months' language training, and emerge qualified for the G (major staff) appointments. The system is reminiscent of the distinction maintained at the old *Kriegsakademie* between the training of 'troop' staff officers and future members of the Great General Staff. A 'Grade D' level of training is planned for lieutenant-colonels and above, but not yet instituted, though the *Führungsakademie* already runs a National Defence Course for senior officers.

The army (or the *Bundeswehr*) maintains a number of other schools attended by army officers, of which the best known is that at Koblenz for *Innere Führung* (an untranslatable term — perhaps 'moral leadership'). Its foundation was insisted upon by idealists among the planning group which set up the *Bundeswehr*, and was intended to teach officers a civic approach to their profession — to replace that 'caste' attitude held typical of the old Prussian officer corps. Originally much derided, it now seems tolerated by, though not very influential within, the *Bundeswehr*. The technical colleges at Darmstadt (*Akademie für Maschinenwesen*) conducts diploma courses (equivalent to those run by the civilian *Technische Hochschulen*) for officers proceeding to technical staff appointments. There are also the *Bundeswehr* Logistic School (Hamburg); Administration and Technical Academy (Mannheim; also trains civil servants); Language School (Euskirchen); Psychological Warfare School (Euskirchen); Intelligence School (Bad Ems); and Physical Training School (Sonthofen). The *Bundeswehr* Medical Academy (Munich) does not train doctors, who are recruited from civilian universities (at which suitably qualified volunteers may also be financed): it provides military medical training to the already qualified, and is therefore not an equivalent of the French military medical school at Lyons.

The *Bundeswehr* universities and vocational schools attract professional interest in Germany as the only educational institutions run under central government control; the Basic Law reserved supervision of education to the *Länder* which results in considerable discrepancies of syllabus and standards from *Land to Land*.

World Armies

Reserves

These total 1,800,000 in all of which 540,000 are available for mobilisation. As a result of the recent reduction of military service from 18 to 15 months, conscripts are liable for instant recall in the first three months after discharge. Officers and NCOs are liable for recall up to the age of sixty, ex-regulars of all ranks up to sixty-five. Reservists are held in the strength of two types of units: those of the Territorial Army (*see* Organisation) and the replacement pool of the Field Army.

EQUIPMENT AND ARMS INDUSTRY

Germany entered both World Wars I and II with one of the largest, most comprehensive and versatile arms industries in the world, though on the second occasion rebuilt at great speed on the much diminished base to which it had been reduced by Allied fiat after the Versailles treaty. After 1945, the German armaments industry, heavily damaged by the Allied strategic bombing campaign, was even more drastically reduced than in 1918. The factories in the Soviet zone of occupation were stripped of their machine-tools, which were sent to Russia; those in the Western zones of occupation were, when rebuilt, re-tooled for civilian production. Between 1945 and 1956 no military equipment of any sort was produced in the Federal Republic, nor very much in the first years of rearmament. By the early 1960s, however, a great deal of public and private investment in heavy industry, usually in those firms with a history of armaments manufacture — Henschel, Messerschmitt and Blohm — had allowed West Germany to begin production of major items of equipment. It is today almost self-sufficient, though its policy is not, as it was before 1939, to design as well as produce all equipment: most of its military aircraft are foreign designs produced under licence and it shares design and development of other items with foreign governments, notably in the field of anti-tank weapons and armoured vehicles.

The major military arms producers are Krauss-Maffei AG of Munich (Leopard tank); Thyssen Rhein Stahl Henschel of Kassel (Jagdpanzer tank-destroyer, Marder APC, and other armoured vehicles); Hanomag (military vehicles); Messerschmitt-Bölkow-Blohm of Munich (anti-tank missiles); Carl Walther of Ulm; Heckler and Koch of Oberndorf; Rheinmettal of Dusseldorf (small arms); Diehl Metallwerk of Nürnberg (anti-armour weapons).

Equipment

Small Arms

Pistol: 9mm PI Walther

Sub-machine-gun: 9mm Uzi (Israel)

(Assault) rifle: 7.62mm G3 (Heckler and Koch; German version of the Spanish CETME)

Machine-gun: 7.62mm MG3 Rheinmettal (the World War II MG-42)

20mm HS 820 Cannon Hispano-Suiza (Swiss)

20mm Rh 202 Cannon Rheinmettal

} Mounted on the Marder APC

Mortars

120mm MRS-120-2 Soltan (Israel; equips the support company of the infantry battalion)

120mm Tampella (Israel; equips the support company of the airborne battalion)

Anti-armour weapons

PZF 44mm one-man rocket launcher (Diehl; the infantry platoon anti-tank weapon)

Milan guided missile (Messerschmitt-Bölkow; the company anti-tank weapon)

SS-11 guided missile (France; partly equips the anti-tank company/battalion in the infantry and armoured brigade)

TOW guided missile (America; equips the anti-tank company of the airborne brigade)

Anti-aircraft weapons

40mm twin self-propelled L60 (American M-42; equips the divisional anti-aircraft battalion (obsolescent))

40mm L70 (American; equips the corps anti-aircraft battalions)

35mm twin self-propelled Gepard (German-Swiss; re-equipping the divisional anti-aircraft battalion)

Artillery

105mm pack-howitzer (Italy; equips the artillery battalion of the mountain brigade)

105mm IFH(L) towed howitzer (Rheinmettal; equips two battalions of the corps artillery)

155mm M-109 SP howitzer (America; equips the gun battalion of the divisional artillery, the brigade artillery battalion (*not* the mountain or airborne brigades) and one battalion of the corps artillery)

175mm M-107 SP gun (America; equips two batteries of the corps artillery)

203mm M-110 SP howitzer (America; equips one battery of the corps artillery; can fire a nuclear shell (held in American custody))

110mm rocket-launcher, 110SF (36 tubes to each launcher; equips two batteries of the divisional artillery)

'Honest John' surface-to-surface missile (America; equips one battery of the divisional artillery; may carry a nuclear warhead (held in American custody))

'Sergeant' surface-to-surface missile (America; equips one battalion of the corps artillery)

Armour

- APC Marder (Rheinstahl–Henschel; equips the *Panzergrenadier* battalion)
- APC Hispano Suiza HS 30 (Swiss–German; Henschel–Hannomag–Leyland; now equips only the support company of *Jäger* battalions (obsolescent))
- APC M-113 (America; partly equips the *Jäger* battalions)
- Armoured reconnaissance vehicle (Hotchkiss; equips the reconnaissance battalion)
- SPZ 11-2 (France; manufactured under licence by Rheinstahl; under replacement)
- Armoured car: Spahpanzer 2 (Rheinstahl–Henschel; replacing the Hotchkiss; 8-wheeled, 20mm cannon, 100k.p.h.)
- Tank-destroyer: Jagdpanzer-Kanone (Rheinstahl; 90mm gun; partly equips the tank-destroyer battalion company in the infantry and armoured brigades)
- Tank-destroyer: Jagdpanzer-Rakete (Rheinstahl; 14SS-11 guided missiles; partly equips the tank-destroyer units (see above))
- Tank: Leopard 1 and 2 (Krauss–Maffei; 105mm gun (British), crew 4; range 600km, weight 40tonnes; engine, Daimler 830h.p.; equips the panzer battalions of I and II Corps)
- Tank: M-48 (America; equips the panzer battalions of II Corps and 6th *Panzergrenadierdivision*; to be replaced by Leopard)

Aircraft

- Alouette II light helicopter (France; equips the divisional aviation squadron and the observation/liaison squadron of the corps aviation command)
- Bell UH-DI light transport helicopter (America; equips the light transport regiment of the corps aviation command)
- Sikorsky CH-53 DG medium transport helicopter (America; equips the medium transport regiment of the corps aviation command)

RANK, DRESS AND DISTINCTIONS

Rank

General	Four stars and oak wreath
Generalleutnant	Three stars and oak wreath
Generalmajor	Two stars and oak wreath
Brigadegeneral	One Star and oak wreath
Oberst	Three stars and oak wreath
Oberstleutnant	Two stars and oak wreath
Major	One star and oak wreath
Hauptmann	Three stars (no wreath)
Oberleutnant	Two stars (no wreath)
Leutnant	One star (no wreath)
Oberstabsfeldwebel	Bronze edging, looped chevron, two chevrons
Stabsfeldwebel	Bronze edging, looped chevron, one chevron
Hauptfeldwebel	Bronze edging, looped chevron
Oberfeldwebel	Bronze edging, two chevrons
Feldwebel	Bronze edging, one chevron
Stabsunteroffizier	Bronze edging,
Unteroffizier	Bronze edging (part)
Hauptgefreiter	Three half-chevron
Obergefreiter	Two half-chevron
Gefreiter	One half-chevron
Grenadier (etc.)	—

All badges of rank are worn (since 1973) on the shoulder strap. Generals' badges of rank are in gold, the rest in silver. Generals preserve the gold-embroidered scarlet patches, derived from the 26th *Altärlisch* Regiment of Frederick the Great and worn by the generals of the Kaisers' army and the *Wehrmacht*. The many graduations of NCO rank are also a historical relic, and are very difficult to relate to those of other armies.

Dress

The *Bundeswehr* has also preserved its traditional facing colours (*Waffenfarbe*) of the arms of service, worn as piping on trousers, hats, shoulder straps and collar badges: General Staff maroon; Armour pink; Armoured Reconnaissance yellow;

World Armies

Artillery brick red; Anti-aircraft Artillery coral red; Engineers black; Signals lemon yellow; Infantry grass green; Technical Troops blue; Army Aviation light grey; Nuclear/Chemical Troops crimson; Military Police orange; Military Bands white; Medical Corps dark blue.

As in East Germany (*q.v.*), the question of what the new army should wear proved a distinctly problematical matter at the time of rearmament in 1956. In the *Bundesrepublik*, it was one on which the public spoke its mind and that of her former enemies was consulted. A return to *Wehrmacht* styles was dismissed and a distinctly civilian design adopted, with short boots in place of the famous 'dice boxes' and an American helmet in place of the 'coal scuttle'. The moderation proved overdone, for the new style did not find favour with those who had to wear it, and it has subsequently undergone a subtle re-militarisation. It remains, however, fairly simple and civilian, and a not particularly traditional dress: light-grey jacket, dark-grey trousers and a peaked cap for walking-out; 'moss-grey' combat suit. Tank crew wear black berets, parachutists maroon, *Jäger* green, *Panzergrenadiere* brown; the mountain troops wear the ski-cap with its edelweiss badge. All ranks wear the black-red-yellow national cockade on their hats.

Distinctions

All *Bundeswehr* regiments carry a colour (*Truppenfahne*), black-red-gold, with the black eagle in the centre, carried on a traditional spear-pointed staff. Recruits are sworn into the regiment holding an edge of the colour. Some medals have been created for the *Bundeswehr* but restrictions on its role have prevented the earning of many: an exception is the 1962 Hamburg flood-catastrophe medal. Medals of World War II may be worn and many are seen on the uniforms of senior officers.

CURRENT DEVELOPMENTS

Since the late 1960s the *Bundeswehr's* main problems have centred on two interrelated issues: internal order and conscientious objection. The idea of *Innere Führung* had always failed to convince the more down-to-earth type of officer and NCO that it provided a basis for military discipline and leadership, and the unmilitary attitudes of many conscripts, exemplified by the right they claimed to dress untidily and wear long hair under the constitutional guarantees of personal freedom, persuaded them that a return to more traditional methods of discipline within the army were necessary. The discontent of many younger officers, calling themselves the 'Captains of 1972', over their limited powers, obliged the Inspector-General to make personal appearances at a number of garrisons to listen to their grievances. As a result, regulations forbidding the wearing of long hair, which was a focus of irritation, were passed in 1972, and other measures instituted which have placated the junior leaders without arousing discontent among the conscripts.

Nevertheless, since 1967 there has been a remarkable rise in conscientious objection to military service, both from those summoned to join and those already serving. Over 2000 serving conscripts applied for discharge on conscientious grounds in each of the years 1971-3 and over 25,000 of those called up. In 1967 the numbers had been 871 and 5963, respectively. The rise appears now to have relented. Nevertheless, it is evidence not merely of anti-militarism and anti-authoritarianism widespread among Western youth and perhaps more accentuated in Germany than elsewhere, but also of the continuing ambiguity of the *Bundeswehr's* status in German political and social life. The very constitutional provisions which make it such a model of democratic military structure are, at the same time, evidence of the underlying mistrust which constitutional government in Germany has for its soldiers. This mistrust is probably now misplaced, but it affects the attitudes of the *Bundeswehr's* officers, in particular, to their role, generating an awkwardness and artificiality in relationships between army and State which do not exist in, say, Britain or America. This does not detract from the military efficiency of the army, which has risen progressively during the 1970s and continues to grow. The standard of training and the morale of conscripts is now very high. The quality of the *Bundeswehr's* equipment is now the best in NATO. Its 12 divisions are undoubtedly now the main ingredient of the alliance's armed strength in Europe.

JOHN KEEGAN

GHANA*

History and Introduction

Ghana attained independence from Britain in 1957 — the first African colony to do so. It was ruled by President Nkrumah until his overthrow in a military and police coup in 1966. From Nkrumah's overthrow to 1969, Ghana's government was the National Liberation Council of army and police officers; this government then formally returned the country to civilian rule and parliamentary government. The civilian government, however, made a number of serious errors and was overthrown by another military coup in 1972. A National Redemption Council, largely of armed forces' officers, was then formed by the coup's leader, Colonel I. K. Acheampong. Ghana's armed forces take pride in their descent from the Gold Coast Regiment of the former Royal West African Frontier Force. The regiment served in the Togo and German East Africa campaigns in World War I (where General Smuts rated it as his best unit), and in the Italian East Africa and Burma campaigns in World War II. A Ghanaian brigade, still including at the time a number of British officers, served with success in the UN Congo Expeditionary Force in 1960–62.

It was, however, from the Congo period that the Ghana army became disenchanted with President Nkrumah, a disaffection that came to a head in 1964–5 when in addition to major national abuses of power, he raised a rival military formation and starved the army of funds. Proposed defence expenditure reductions were also an important contributory cause of the 1972 coup.

Since 1972 occasional evidence of unrest and political ambition among small groups of junior officers and NCOs has appeared: one or two senior officers, too, have on occasions been transferred to unimportant duties or to work abroad somewhat unexpectedly. The country is to return to a form of civilian rule entitled 'union government' in July, 1978: this will provide for an elected legislature but no political parties. It is expected that the army will still play a role in the government, though less conspicuously than at present.

Strength and Budget

Population: 10,500,000 (approximately)

Army: 15,000, plus an air force of 1200, a navy of 1400 and a border guard of 3000

GNP (1977 estimate): \$4,000,000,000

Defence expenditure (1977): \$130,000,000

Command and Constitutional Status

In 1976 the National Redemption Council was replaced as supreme authority by a Supreme Military Council, consisting of the Head of State (General Acheampong) as Chairman, the Chief of the Defence Staff, the Army Commander, the Commanders of the Navy, Air Force and Border Guards, and the Inspector-General of Police. At the end of 1977, the Chief of the Defence Staff was Major-General F. Akuffo, and the Army Commander was Brigadier Robert Kotei. The Air Force Commander was Major-General G. Y. Boakye and the Border Guard Commander an officer loaned from the army, Major-General E. Utaka.

Role, Commitment, Deployment and Recent Operations

The large size of the Ghana army is a legacy of the grandiose ambitions that President Nkrumah entertained for his country, a size which successor governments have been unwilling or unable to reduce substantially. The army does, however, have certain specific commitments, notably that in relation to Togo. The Ewe ethnic group lives on both sides of the border, the majority on the Togo side, and the Ghana government is periodically faced with a secessionist movement; the issues are complex, being further complicated by the fact that the present border is not that of the old German Togoland colony, but further east (i.e. to Ghana's advantage). A need for a strong force to overawe Togo is perceived, and Togo complicity in conspiracies to overthrow the government are periodically alleged.

Other recent commitments include border patrolling (to prevent the outward smuggling of cocoa, for which a better price can be found in neighbouring Francophone States) and the despatch of one battalion to the United Nations Command in Sinai.

* For general notes on African armies, see Appendix 1.

World Armies

Organisation

The army is composed of two brigades of three infantry battalions each, supported by an armoured car reconnaissance battalion, a field engineer battalion and a mortar battalion. A seventh battalion was disbanded, though the parachute battalion, disbanded by the 1969–72 civilian government, is being reformed. It will lack any real capacity for dropping.

The brigade headquarters are at Accra (1st Brigade) and Kumasi (2nd Brigade). Battalions are generally posted to Accra, Tema and Takoradi (1st Brigade) and Kumasi, Sunyani and Tamale (2nd Brigade).

Army headquarters is at Burma Camp, Accra. The Border Guard force is organised into three battalions and is at present mainly deployed in the Eastern Region.

The air bases are at Tamale and Takoradi.

Recruitment, Training and Reserves

Recruitment is voluntary. The army still contains a large number of soldiers from the poorer ethnic groups of northern Ghana and also a number from Franchophone States further north attracted by the conditions of service. Recruits are trained at the combined services basic training centre at Kumasi. There is a military cadet academy (with a 2 year course), a school of infantry and a junior officers course, at Teshie, near Accra.

With British assistance a small staff college opened recently at Teshie; it is planned to move this to new buildings at Ahwereagi. Training is perceived to fall under two main headings: forest training and savannah training; units are expected to be proficient in both. A small number of officers and soldiers receive parachute training.

For a period of three years after independence, the Ghana army relied heavily on British assistance and British officers in command appointments, a reliance largely caused by Nkrumah's doubling of the army's size. In 1961 however, almost all of the British officers were repatriated and British assistance was replaced by Canadian instructors, on a much reduced scale; but officers were still sent to Britain for staff training and also a few cadets to Sandhurst. One or two cadets were sent to Pakistan; Israel and the Soviet Union both promised military help, but apart from the provision of Israeli mortars and some very out-of-date Soviet equipment, the assistance appears to have been negligible. After the fall of Nkrumah there was an increased use of British facilities in the N.L.C. period including battalion exchange visits in 1968 and 1969. Since 1970, foreign exchange has proved the largest obstacle to further overseas training, though arrangements whereby a small number of officers, cadets and specialists train in Britain, continues.

Foreign exchange shortages have had two other specifically military consequences. All units are required to grow a proportion of their own food in unit farms, and much of the army's transport is earmarked as a 'task force' to help the civil administration.

Equipment and Arms Industry

The Ghana army's equipment is mainly British, though some Soviet items are still held. The infantry battalions have British battalion weapons, e.g. SLR, GPMG and 84 mm Carl Gustav rocket launchers; the battalion 81 mm mortars are however Israeli, etc. The reconnaissance battalion has 10 Saladin and 30 Ferret armoured cars, and the artillery battery uses Israeli 120 mm mortars, a few Soviet 76 mm guns, and a few British 25 pounders; these latter are being replaced by 105 mm M-56 guns.

The air force's main equipment is six Macchi MB 326 K air-to-ground strike aircraft. In addition there are two transport squadrons, a small light-aircraft army communication/liaison squadron, a helicopter squadron and a training squadron.

Italian training arrangements are planned for air force personnel.

Rank, Dress and Distinctions

The Ghana army uniforms still closely follow British patterns in rank structure, dress and uniform embellishments. The different battalions have distinctive belts or lanyards, rank insignia differ from those of Britain only in the replacement of the crown by a national emblem, gold braid on caps again follows the British model. Distinctive, however, is the scarlet ceremonial parade tunic, worn above dark-blue trousers with a red stripe. The Ghana air force officers were recently given military rank titles in place of those which had followed the British RAF pattern.

Current Developments

Ghana's army has been an efficient force capable of containing an attack by a force on its home territory, or of supplying contingents to UN or other multinational forces. Recently however its efficiency has suffered in a number of respects: the need felt by an increasingly unpopular military government to use some of the army's best officers in civil administration, personal and ethnic jealousies, and the acute shortage of foreign exchange making it difficult to maintain an adequate supply of spare parts and new equipment.

L. L. MATHEWS

GREECE

HISTORY AND INTRODUCTION

In the course of this century Greece has fought in five wars, endured two foreign occupations, and suffered a catastrophic civil war, which might be thought enough to keep its army fully occupied. That is not the case, however: since 1900 Greece has also experienced 10 major military *coups d'état*, several bouts of fighting between army factions, and a host of minor military upheavals.

This dismal pattern is not fundamentally due to the army's lack of discipline (though that has often enough suffered from the consequences of political involvement). The basic clash between the military and the civilian ethos in Greece, indeed, arises from the fact that the army is the only effective corporate institution of wide membership in the entire Greek nation, with a vision of an orderly, 'Western' Greece that is utterly at odds with the fiercely fractious individualism that is the Greek reality in politics, business and private life. Some officers are seduced by the universal civilian systems of patronage and so drawn into the political arena, while others are driven by disgust verging on despair to try their hand at uprooting such systems by firm military rule.

The Greek army of today, even after the shattering experience of the collapse of the most recent period of military rule in 1974, still has clearly identifiable patterns of behaviour and belief that can be traced to its past experiences over a century and a half of turbulent Greek history. The only period which has not left a residue, surprisingly, is the Greek War of Independence itself, ending in the establishment of an independent Greek national State in the Balkans for the first time in history. The semi-regular soldiers and semi-brigand armed bands that fought in that struggle were almost all disbanded immediately afterwards, and the bulk of the Greek army during the first decade after 1833 was in fact comprised of 3500 Bavarian soldiers who arrived in that year with the new King Otto. Only a handful of Greeks were retained in military service, and employed as the Athens garrison.

The first act of self-assertion of a genuinely Greek army was the mutiny of that garrison in 1843, which succeeded in extracting a constitution of sorts from King Otto and also insisted upon the Hellenisation of the army. The tradition of German training and methods in the army, however, was not broken by this upheaval, or even by the overthrow and expulsion of Otto 20 years later. The new dynasty, though Danish by origin, maintained the German orientation of its predecessor in military matters. The army's close personal links with the monarchy, and that of the monarchy with the German court, actually grew more influential with the passage of time: at the outbreak of World War I the new King Constantine (who had personally commanded the army in the successful Balkan Wars in 1912–13 as Crown Prince) was married to the Kaiser's sister, and convinced that a German victory was inevitable. This was one of the strands that was to prepare the way for the catastrophe that is Greek history from 1915–50.

The second strand was the growth in Greece after about 1850 of *Megali Idea* (the Great Idea) as the focus and goal of all nationalist sentiment. It was nothing less than a project to reverse several centuries of history in Asia Minor, and re-establish Byzantium. Way-stations along this road were to include the rounding out of Greece's frontiers in Europe to embrace all those areas containing Greek majorities or even large Greek minorities (a process more or less completed by the Balkan Wars), and the ingathering of the various islands like Crete and Cyprus which had majority Greek populations. The ultimate goal, however, was nothing less than the recapture and re-Hellenisation of Constantinople (Istanbul) and of at least the western parts of Anatolia, where a considerable Greek minority had continued to live and even to flourish during over five centuries of Ottoman Turkish rule. From the mid-nineteenth century onwards devotion to *Megali Idea* became the litmus test of nationalist virtue, and the dominating theme in Greek foreign policy, leading to ever more adventurous and even reckless foreign policies.

The third strand in preparing the disaster was the politicisation of the Greek army. Greek governmental chaos in the late nineteenth century (an average of one government every 9 months between 1864 and 1908) was appalling, but it owed little to the army. The Greek army had never been neutral in politics, of course — no Greek individual or institution is permitted that luxury — but it had not been a particularly coup-prone army. The key event in establishing the very different twentieth century pattern of army behaviour was the coup of 1909, which was directed (like so many since) at a government which had failed to measure up to the demands of *Megali Idea*, by giving in to international pressure not to declare a union with Crete. (The Cretan situation was very similar to that in Cyprus 50 years later.) Not only did the army revolt set a new precedent for military intervention, but it also actually brought to power Eleftherios Venizelos, the Cretan politician who was to dominate the next 20 years of Greek history.

These three strands came together in 1915, when King Constantine and the bulk of the army's senior officers, pro-German or at least convinced of German military superiority, insisted on remaining neutral. For Venizelos and the passionate adherents of the Great Idea, however, the war was Greece's golden opportunity: by fighting on the side of the *Entente* powers Greece could demand and get the lion's share of Anatolian Turkey in the post-war share-out of territory.

World Armies

The quarrel between Prime Minister Venizelos and the King, abetted by the representatives in Athens of the warring powers, rapidly led to the division of the army and the country between a republican regime based in the north at Salonika and committed to the allied cause, and a royal government and army based in Athens and determined on neutralism. The French occupation of Athens in 1916 (and of the whole country by mid-1917) ended the visible divisions, but the bitter monarchist–republican split was to dominate Greek politics for the next 30 years. Traces of it can be discerned even today.

In the short run it led to the participation of the Greek army (thoroughly purged of 1500 monarchist officers) in the final offensives of 1918 in the Balkans, and to a share in the occupation of long-desired Constantinople. Venizelos eagerly agreed to provide Greek troops for occupation duties in Anatolia as well, and by 1920 the Great Idea seemed to be on the brink of success. At that moment the young King, in whose favour the pro-German Constantine had abdicated the throne in 1916, suddenly died, and Constantine himself returned, to be approved overwhelmingly in a national referendum. Venizelos went into exile, Constantine reinstated all the purged monarchist officers and ejected Venizelos's republican supporters instead, and the army was sent marching off into the heart of Anatolia in search of decisive victory over the Turkish nationalist forces of Mustafa Kemal (Ataturk).

The military disaster that overtook that army in 1922 was in a sense inevitable, for there was never any realistic possibility that Greece could establish control over Western Anatolia in face of the hostility of a large and determined Turkish majority. But the successive purges, and the blind factional stubbornness that had infected all areas of Greek politics including the army, was certainly a contributing factor to the scale of the disaster, whose shock is still reverberating in Greece today. In the space of a few weeks, the entire Greek population, some 1,250,000 people, were swept out of Anatolia ahead of the victorious Turkish army, and 3000 years of continuous Greek settlement on the eastern shores of the Aegean came to an abrupt and permanent end. The Greek army was utterly shattered, and a number of refugees from Anatolia equal to one quarter of the native population was suddenly dumped on an impoverished Greece unable to feed and shelter even its own population.

The Venizelos/republican faction had begun the adventure, the monarchist faction had taken it over on the way to catastrophe, and each could and would blame the other in the harshest terms for decades into the future. In the immediate aftermath of the Anatolian disaster Constantine went into exile again, the republican officers seized control of the army once more, and the monarchist commander-in-chief and five former cabinet members were executed. It was a measure of the unutterable bitterness of the mutual recriminations, hatreds and fears that now came to dominate Greece, as the unhealed divisions distorted both political and military life, and another precedent for the future.

The army had in some senses been the arbiter of power ever since 1843, but it was in the chaotic years 1922–36 that the tradition of military intervention in the modern style took root. In those years there were 19 changes of government, seven military coups and an almost constant flow of abortive plots. Moreover, every royalist or republican coup or counter-coup by the army — or the navy — and every change of civil government became the occasion, more than ever before, for yet another purge of politically suspect members of the officer corps, in the search for a wholly illusory security. Not only did military intervention in politics become established, but political meddling with the army became the accepted *quid pro quo*. Hundreds and even thousands of officers were purged as governments flickered past, now military, now civilian, this one monarchist, that one republican. Executions were not unknown.

This anarchic period was ended by a coup by royalist officers in 1935 that managed to hold on to power. The monarchy was restored, the ageing Venizelos was sentenced to death *in absentia* (and two of his colleagues in the flesh), and within a year General John Metaxas had emerged as military dictator under the King. His rule was widely characterised as fascist (in the strict, rather than merely the pejorative sense of the word) by those who confused it with the populist right-wing regimes then typical of central Europe, but it was in fact in a purely Greek tradition of military rule which had already established itself in the 1920s, and was not without crude similarities to the pattern of administration that then prevailed also in the neighbouring Turkey of Ataturk. In the Greek case, however, it proved both more extreme and longer lived.

The puritanical values of Greek military governments, and the stumbling means by which they have sought to impose them on an unwilling Greek population, have been remarkably similar throughout this century, from General Pangalos in 1926 through General Metaxas in 1936–40 to Colonel Papadopoulos in 1967–73. All were devoted to an ideal of 'Hellenic-Christian civilisation' in which the Greeks were not the squabbling, venal mortals of reality but the noble abstract beings of an impossible mythological past, and all were determined to transform their countrymen from the former to the latter state by the sharp smack of barracks discipline. It gave rise to a frustration entirely understandable inside the army, where the dominant virtues were order, duty and patriotism, and to an ambition utterly hopeless in reality.

Pangalos, like all his successors, began by censoring the press, exiling his opponents, and demanding efficiency from the civil service, but soon he could think of little better to do than to forbid women to wear skirts more than 14 inches above the ground. Metaxas followed much the same course, with the added attractions of social welfare measures (directed most notably towards the rural population), public works and the construction of a massive security police apparatus. Thirty years later the colonels around Papadopoulos were pursuing precisely the same path yet again (complete with compulsory haircuts for hirsute tourists at the Greek border), and hectoring and cajoling the population to be worthy of their Greek heritage in a tone of voice almost identical to Metaxas's (one observer, indeed, has referred to their performance as 'a gigantic act of historical ventriloquism').

The one element in the army's ideology which was new in Metaxas's time, though it has been prominent ever since, was a rigid and fanatical anti-communism. It began when the tiny Greek Communist Party, based mainly amongst the destitute

Anatolian refugees, briefly achieved a position of balance of power in the mid-1930s, but it had to wait for the 1940s to reach its full flowering. Meanwhile, Greece was invaded by Italy in 1940. Initial Greek resistance to the incompetent Italian attack was successful, and Metaxas died before the German invasion of the subsequent spring destroyed Greek resistance. There then ensued 4 years of occupation, followed by 3 years of civil war. During the decade of the 1940s over 10% of the Greek population died due to the fighting or to starvation, and an already poor country was laid waste.

As in many other occupied countries of Europe, the communists of Greece, with their highly secretive administrative structure, proved to be the most effective group in the organisation of a resistance movement. By early 1943 their own force, ELAS (National Popular Liberation Army) was by far the largest of the Greek guerrilla organisations. By no means all their fighters were communists — many were simply republicans disgusted by the futile quarrels of the exiled monarchist government — but the leadership was firmly in communist hands. This leadership showed its hand prematurely in the summer of 1943, however, in the so-called 'first round', when under the mistaken impression that the forthcoming Allied landings would be not in Italy but in Greece, the communists launched surprise attacks aimed at destroying all the other Greek resistance movements. By the end of the year only one survived, in a distant corner of the country, while the communists controlled virtually all the rest of Greece except for the German-occupied main towns and communications routes.

This premature revelation of their purposes was ultimately fatal for the Greek communists, however, as it caused a gradual drift of republicans into alliance with the exiled monarchist government, and alerted the British in the Mediterranean to the true situation in Greece. The communists succeeded in fomenting a major anti-monarchist mutiny in the Greek army in exile in Egypt in the summer of 1944, just before the Germans evacuated the country and the legal government returned, but British military forces were sent to Athens to support the government in lieu of its own troops. When they arrived they found ELAS forces in control in fully nine-tenths of Greece, and the showdown came in December, 1944 when the communist forces refused the British commander's demand that they observe an agreement to disband all guerrilla units and reform within a Greek national army. In the so-called 'second round', communist forces took four-fifths of Athens, including the harbour and one of the two airports, and fought their way to within 300 yards of the British Embassy which was serving as allied headquarters, but British reinforcements were urgently sent over from Italy and succeeded in re-establishing control. By January, 1945 the second round was over, and ELAS agreed to surrender its arms (probably on Stalin's orders, pursuant to his 'percentage agreement' with Churchill).

However, there then began a white terror, directed not only at known communists, but at anyone who had been associated with ELAS in the fight against the Germans. The vengeance campaign was headed by monarchists and some former collaborators, but received strong support from the security forces (which had been purged of all left-wing elements after the 1944 mutiny). In less than a year 3000 people were officially condemned to death, at least another 500 murdered, and there were 20,000 in prison with a further 50,000 facing prosecution. It was in these circumstances that ELAS took up arms again for the 'third round', by far the worst, in 1946. There ensued 3 years of full-scale civil war, now centred in northern Greece where the communists were receiving aid from Albania, Yugoslavia and Bulgaria, which cost 150,000 casualties and made a million people refugees. The remnants of the economy were utterly ruined, and political reconstruction did not even get underway; between 1945 and 1952 there were over 20 Greek governments, with an average life of 150 days. The army was gradually rebuilt during the fighting with British and then American aid, and in the formative experience of the civil war tempered the obsessive anti-communism that has characterised it ever since.

At just this time, however, there occurred two remarkable changes of fortune which transformed Greek prospects, and led to a 15 year period of stable democratic politics and rising prosperity unprecedented in modern Greek history. The first was General (later Field-Marshal) Alexander Papagos, a military hero from both the Italian and the civil wars, who refrained from seizing power by the usual *coup d'état*. Instead he exploited his popularity to win power by elections (modelling himself consciously on de Gaulle) in 1952, and succeeded in passing on a stabilised political system to his successor, Constantine Karamanlis, in 1955. He was greatly aided in this by the second stroke of luck: the change from bankrupt Britain to wealthy America as the constitutional government's principal outside supporter upon the proclamation of the Truman Doctrine in 1947.

The consequence was an immense flow of American aid and investment that fuelled Greece's startlingly rapid economic recovery and expansion through the 1950s and early 1960s. By making hitherto undreamt of sums available to the government, for allocation by the usual patronage channels, it may also have been the main factor in enabling Karamanlis to rule as Prime Minister for eight unbroken years, twice as long as anyone else in modern Greek history. For the army, particularly after Greece's accession to the NATO treaty in 1952, it meant a flood of modern American weapons and a new role (at least in theory) as a member of a large alliance. Although its political perceptions and priorities were little changed by the close relationship with the United States, it did end up using almost exclusively American military assumptions, procedures and weapons.

Politically, the army remained an enclave of anti-communism and strongly authoritarian ideas, best typified perhaps by the ultra-right-wing secret organisation IDEA (Sacred Union of Greek Officers) which was founded in the early 1950s. This orientation, though not out of harmony with the general political atmosphere at the end of the Civil War, led to increasing hostility and suspicion between the army and civilian politics as the latter drifted leftward over the succeeding years.

The primary cause of that leftward drift was unquestionably the Cyprus problem, which first emerged in 1950, but grew

World Armies

far more acute after the EOKA guerrillas began operations there in 1955. The failure of NATO to take a firm position in favour of the Greek case, due to the fact that Turkey was also a NATO member, occasioned a steadily rising agitation against NATO links in Greece, and the resultant growth of the far-left EDA (United Democratic Front) to the position of second-largest party. Karamanlis's staunchly conservative government resisted these pressures (an agreement on storing American nuclear weapons in Greece was finally signed in 1959) and in 1960 the crisis seemed to have ended with a settlement that the government could defend. The respite proved only temporary, however; the newly founded Centre Union Party of George Papandreou, the grand old man of republican Greek politics and a one-time *protégé* of Venizelos, quickly joined the EDA in condemning the 1960 compromise creating a bi-national Cypriot republic as an unprincipled betrayal of the sacred Greek national cause for a mess of American potage. *Megali Idea* re-emerged to dominate Greek politics, with consequences almost as grave as before.

Papandreou's party scraped a narrow victory in the 1963 elections. When it then resigned in December, 1963 to seek a larger majority (which it eventually got), President—Archbishop Makarios of Cyprus exploited the political paralysis in Athens and in Ankara (where there was also a caretaker cabinet) to abrogate the rights guaranteed to Turkish-Cypriots under the 1960 Constitution. The large-scale fighting in Cyprus that followed, accompanied by an acute Greek—Turkish crisis which came close to war, spelled the end of political stability in Greece. Greek impotence to impose Athens's preferred solution in Cyprus was reflected in a mounting verbal hostility of the government against NATO, and Papandreou's reckless rhetoric encouraged the renewed polarisation of Greek politics. The right was greatly alarmed by the rapid advancement of Papandreou's son Andreas, who came to symbolise the re-emergent left, and by the growth of Soviet influence in Cyprus. In the time-honoured Greek way, everybody began to scent foreign intrigue and domestic plots, a perception given some substance by the uncovering of the so-called *Aspida* (Shield) group of young left-wing Greek officers in Cyprus, who were reputed to be planning a republican coup. Only some 28 officers were implicated, but Andreas Papandreou was accused of being involved with them.

The final blow to Greek political stability was the elder Papandreou's attempt to reconstruct the Greek officer corps by purging its right-wing senior officers, many of whom owed their advancement to Metaxas, and all of whom were immured in a 30-year-old right-wing tradition of royalism and extreme anti-communism. When Papandreou's own Defence Minister refused to accept a new list of army transfers and promotions in July, 1965 the King refused to allow the Prime Minister himself to assume the Defence post on the grounds that his son was under suspicion with regard to the *Aspida* affair. Papandreou resigned, and the King hastily appointed a new, conservative government. The last 18 months until the inevitable army coup was a scene of chaotic disorder as the left-wing parties furiously attacked the King, the government and the army amidst violent street demonstrations, and right-wing groups retaliated with the implicit approval of the security forces.

The coup of April 21st, 1967 that inflicted a 'mercy killing' on Greek democracy (the phrase is Constantine Karamanlis's) came from the army, as expected, but not from its leadership. A virtually unknown group of colonels seized power in an almost bloodless operation and proceeded in time honoured fashion to 'cleanse' the nation of the excesses produced by unfettered democracy. The leader, Colonel George Papadopoulos, was Head of the Greek Intelligence Service, giving substance to the instant Greek conclusion that the coup had been sponsored by the American CIA, but there was neither evidence nor logical reason to support such a provenance. The number of officers directly involved in the coup numbered no more than 300 in the 9000-strong officer corps, but they unquestionably represented a much broader body of sentiment in the army.

All the familiar measures were taken: martial law, censorship, the banning of strikes and public demonstrations, the arrest of 7000 people in a few days (though all but about 1000 had been released by 1969), a purge of the civil service and the professions, loyalty tests for university students, etc. The Communist Parties remained illegal, of course, and all left-wing political activists became the object of severe repressive measures. There was also the customary authoritarian imposition of the rural and *petit-bourgeois* moral values that prevailed in the officer corps: a ban on long hair, mini-skirts, music in public places after midnight, and such deplorably 'Eastern' Greek customs as smashing crockery in cafes.

The 'Hellenic—Christian' version of the Greek nation, with strong emphasis on the unity of Orthodox Church and State, on the artificial *Katharevousa* version of the language which was invented in the last century as a bridge between modern demotic Greek and the 'pure' language of classical times, and on the Apollonian rather than the Dionysian version of Greek culture, was relentlessly imposed on the resistant Greek reality. In the economic sphere also the *junta*, made up almost entirely of former village boys raised in grinding rural poverty, pursued the usual course of Greek military regimes: strict financial discipline, and stabilisation of the currency (after severe inflation in the last years of civilian government), together with a determined drive for economic growth which met with some success.

The military regime of 1967–74 was not precisely fascist, though it indulged in much brutality and some torture of prisoners. It shared certain features with classical fascism — a populist tone, ultra-nationalism, moral conservatism and anti-establishment radicalism — but it created neither a totalitarian party nor effective mass organisations. It was certainly not royalist: the colonels regarded the most senior, royalist officers as being just as much tainted by corruption as the old political establishment, and purged them from the army at once. When the King made his feeble attempt at a counter-coup in December, 1967 they sent him packing into exile and appointed one of their number as 'Regent'. Their initial base in the army (patronage soon extended it) was the so-called 'captain's parliament' of some 150 junior officers whose ideas were not far from Nasserist, although that too lost its impetus once the fruits of power began to be enjoyed by the new rulers.

The long-term political programme of the colonels' *junta*, such as it was, envisaged a gradual transition to some form of 'guided democracy' under army supervision, after the passage of an indeterminate number of years. The leading regime figures resigned their army commissions in early 1968, and proceeded to erect a civilianised façade for the regime. The process went so far as the creation of a republic, approved by referendum in July, 1973, but the only real source of the regime's power remained the army. As the leading figures of the *junta* came ever more closely to resemble the stereotypically corrupted civilian politicians they had replaced, so their support in the army melted away. Following the brutal suppression of rioting at the Athens Polytechnic in November, 1973 (34 dead, and almost a thousand injured), the discredited Papadopoulos government was overturned in a bloodless coup led by General Phaedon Ghizikis. This short-lived second *junta* was, if anything, even less competent than its predecessor, especially in foreign affairs.

Greece had already become seriously isolated under the first military regime: its membership of the Council of Europe was suspended and its progress towards Common Market membership halted, while its relations with Turkey became increasingly strained by the Cyprus problem. Under Ghizikis, and due directly to his attempts to undermine the government of Archbishop Makarios, this problem rapidly turned into a full-blown crisis. With a dazzling combination of ruthlessness and ignorance, the Greek military government conspired at the violent overthrow and attempted assassination of Makarios by the Greek-Cyriot National Guard under the leadership of Greek army officers in July, 1974. Athens apparently expected that the Turks, under American pressure, would accept this *fait accompli*, and made no serious preparations for any alternative outcome.

The consequence, of course, was the Turkish invasion of Cyprus, and the sudden eruption of a Turkish-Greek confrontation for which the regime was utterly unprepared. Greece was quite incapable of bringing military pressure to bear in the vicinity of Cyprus, which is 600 miles from Greece and only 60 miles from Turkey. The panic-stricken mobilisation of the Greek armed forces to face the contingency of war with Turkey in the Aegean sea and along the Thracian border revealed that 7 years of soldiers in government had rotted the military efficiency of the armed forces. With the dazed government evidently preparing to sleep-walk into an already lost war, army units in the north refused to accept its orders, and the *junta* collapsed less than 96 hours after the Turkish invasion of Cyprus. In a matter of days a provisional civilian government had been re-established under the leadership of former Prime Minister Constantine Karamanlis, who returned from 11 years of self-imposed exile in France.

War with Turkey was averted, although the military tension between the two countries has remained high ever since. In elections held later in 1974 in an atmosphere of continuing crisis, Mr Karamanlis's conservative New Democracy Party won 54.4% of the vote and secured over two-thirds of the seats in the national parliament. Andreas Papandreou's Pan-Hellenic Socialist Movement (PASOK) won only 14% of the votes, and the two newly legalised Communist Parties a mere 9½%.

The issue of the monarchy was swiftly closed by a referendum confirming the republic, and in January, 1975 a new Constitution (modelled closely on the pre-coup Constitution of 1952) was adopted. The leading *junta* members and the more notorious torturers were tried and imprisoned, and the army purged of the more prominent adherents of the previous regime. Civilian democracy was re-established with remarkable speed and unanimity, and the books were ostensibly closed on the past.

The legacy of the *junta* years and the 1974 humiliation still dominates Greek foreign relations, however. Since that date the country has been engaged in a crash rearmament programme to counter the perceived Turkish threat, involving extremely heavy expenditure of foreign exchange. Greek bitterness at the unwillingness of their NATO allies to take their side against Turkey in the 1974 crisis led to the immediate withdrawal of the Greek armed forces from the alliance's military command, though Greece remains a member of the political organisation. Resentment at American dealings with the *junta* during the years of military rule has been fortified by a widely shared Greek conviction that the 1974 disaster was somehow the result of a devious American plot, with the consequence that anti-American public opinion has forced the government to restrict American base rights in the country drastically. Even the Greek application to become a full member of the European Economic Communities, which was formally submitted in the course of 1977, has attracted the hostility of the left in Greek politics.

The elections of November, 1977, moreover, showed that the conservatism of the Greek electorate in 1974, in the midst of an acute crisis, was more apparent than real. Mr Karamanlis's party was re-elected with a severely reduced popular vote of less than 42% (although it still won enough parliamentary seats to govern alone), while the combined communist vote rose to 12% and PASOK's support soared to 25.3%. These latter parties advocate Greek withdrawal from NATO, the closing of American bases, and a policy of non-alignment. The first signs of renewed polarisation in Greek politics may be discerned, and there are as yet no solutions visible to the grave international problems, containing a substantial military dimension, which bedevil the country. The Greek army, however, is back in its barracks, and likely to remain there at least for some time.

STRENGTH AND BUDGET

The total regular strength of the Greek armed forces is 200,000, up from 161,000 in 1975 as a result of the confrontation

World Armies

with Turkey. Of these, 148,000 are conscripts serving for a period of 30 months. 2.2% of the total Greek population is under arms, a ratio surpassed in the entire world only by Israel, Syria, Jordan, Taiwan and North Korea.

Army strength is 160,000 (123,000 conscripts), with about 270,000 reservists. The navy numbers 17,500 (11,000 conscripts) with an additional 20,000 reservists. The air force has 22,500 personnel (14,000 conscripts) and about 20,000 reservists. The principal paramilitary forces are 28,000 Gendarmerie and 90,000 National Guard.

The defence budget in 1978 was \$1,520,000,000. This is 23% of total government expenditure, a slightly reduced proportion from the previous year, but still the highest percentage of any NATO member.

COMMAND AND CONSTITUTIONAL STATUS

The Commander-in-Chief of the Greek Armed Forces is the President, elected by Parliament for a 5 year term. The office is currently occupied by Mr Constantine Tsatsos. He has the authority to declare war and to conclude peace treaties; in exceptional circumstances he may preside over the Cabinet, or suspend Parliament for a period not exceeding 30 days. He may also call together the Council of the Republic, a body made up of all former democratic Presidents and Prime Ministers, plus the current President, Prime Minister and Leader of the Opposition, which may authorise the President to dissolve Parliament.

The three services are integrated under the Ministry of National Defence. The responsible Minister since 1974 has been Mr Evangelos Averoff. Until recently the Defence Minister's immediate subordinate was the Armed Forces Commander, under whom were separate Commanders of the Army, Navy, Air Force and Gendarmerie. In August, 1977 however, this structure, introduced by the colonels, was replaced by the pre-1968 command structure in order to reduce the danger of military takeover. The most senior serving officer is now the Chief of the National Defence General Staff, a post in which officers of the three services will alternate. The present incumbent is General Ioannis Davos (army), the officer who played the key role while commanding in the north in 1974 in bringing about the collapse of the *junta*. The Chiefs of the Army, Navy and Air Force General Staffs are separately and directly responsible to the Ministry of National Defence for matters pertaining to their own services, and the entire structure of semi-autonomous high commands has been abolished.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

The Greek armed forces have two primary roles in defence of the country: the long-standing tasks of defending the north of the country against Soviet attack, and assisting in the maintenance of Western control over the eastern Mediterranean in wartime, which are the responsibilities allotted to Greece as a NATO member; and the more recent and now higher priority role of establishing at least an equilibrium of power with Turkey.

Defence against the Soviet threat means essentially defence of the border with Bulgaria. There is no perceived military threat from non-aligned Yugoslavia, with whom relations have been cordial since shortly after Marshal Tito ceased aiding Greek communist forces in the Civil War of 1946–9. Diplomatic relations with Albania were only established in 1971, and there is little warmth in them due to the acute ideological differences and a lingering border dispute (there is a Greek minority in southern Albania), but as in the Yugoslavian case there is no anxiety in Athens about a possible military confrontation. Neither Yugoslavia nor Albania, of course, is a member of the Warsaw Pact, and both States are if anything more concerned about the threat of Soviet invasion than Greece itself.

The Bulgarian threat, on the other hand, is taken very seriously. There are no Soviet troops stationed permanently in Bulgaria in peace time, but the Bulgarian armed forces of 148,000 men possess almost twice as many tanks as Greece. The geography of north-eastern Greece, moreover, makes it very difficult to defend: a strip of land several hundred miles long between Bulgaria and the Aegean Sea, averaging only 30–50 miles wide. Although it is likely that in any general European war the bulk of Bulgarian forces would be directed eastwards towards the strategically vital objectives of Istanbul and the Straits, few Greeks doubt that a substantial proportion would be reserved for an attack into western Thrace. Although the region has been thoroughly Hellenised since it fell to Greece in the second Balkan War of 1913, Bulgaria's resentment at having been robbed of its spoils from the First Balkan War of 1912, and thus of its long-sought sea-coast on the Aegean, has been a constant if sometimes muted theme of Bulgarian nationalism ever since.

The other role of the Greek armed forces, defence against Turkey, has been growing in significance ever since the first Cyprus crisis, but it was after 1974 that it took over as the first priority. It is the perception not only of the possibility of war with Turkey over Cyprus but of a longer-term Turkish expansionism aimed at Greek islands and perhaps even mainland territories (however dubious in fact) that has caused such a dramatic rise in Greek defence budgets and armed forces manpower since 1974. Obviously, this has helped to downgrade the NATO link, since NATO obviously cannot be of assistance in the event of a war between two of its own members.

The likeliest trigger of a war with Turkey, and its focal point, in the Greek view, would be the waters around the Greek islands which fringe the west and south-west coasts of Anatolia. These have given rise to a dispute, independent of the

Cyprus question although exacerbated by it, over the proper demarcation line on the seabed of the Aegean. Athens insists that the distribution of Greek islands across the entire sea gives it rights to over 90% of the seabed, while Ankara claims that the respective continental mainlands should be the point of reference for the drawing of a median line, Greek islands to the east of that line generating seabed rights only under their individual territorial waters. (Such a solution would give Turkey 35–40% of the Aegean seabed.) The discovery of modest quantities of offshore oil in the northern part of the Aegean, together with unofficial claims raised by Turkish extremists to the offshore Greek islands, have lent even greater sharpness to the dispute.

As a result, Greece has remilitarised its islands off the Turkish mainland in defiance of the Lausanne treaty, pointing to the creation of a 4th Turkish Army on the Aegean coast as justification, and has spent large sums on the fortification of the larger ones. Considerable Greek army forces have also been repositioned closer to the Turkish land border in Thrace. In recognition of the fact that any war with Turkey would be fought mainly in the Aegean, where naval and air forces would be decisive, the thrust of the massive Greek rearmament programme since 1974 has been directed towards ensuring that at least the navy and air force are comparable in numbers and quality to their Turkish equivalents, even if Greece cannot hope to match an opponent with four times the population in the numerical strength of its ground forces.

It would be easy to exaggerate the effect of this reorientation of defence priorities on the actual disposition of forces, however. The number of troops absorbed by the defence of the Aegean islands is relatively small, and the bulk of the Greek army has to be in roughly the same north-eastern area whether its potential opponent is Bulgaria or Turkey. Similarly, the Greek navy and air force are primarily intended for Aegean operations whether the crisis should be one with the Warsaw Pact or with its own NATO neighbour.

Commitment

Greece's main military commitments are its membership of NATO, and its bilateral arrangements with the USA providing American base facilities in the country. Both of these arrangements, however, have been subjected to severe strain since 1974, and the terms have been changed considerably.

Greece withdrew its forces from NATO command in peacetime on August 14th, 1974 and placed them all under exclusively national command. Since then it has refused to allow the ships or aircraft of its nearest NATO ally, Turkey, to operate in its part of the Aegean, and it has withdrawn its contingent from the staff of NATO South-Eastern Headquarters in Izmir. Athens has also withdrawn from the NATO Defence Planning Committee in Brussels, and for 3 years refused to take part in NATO exercises involving Turkish units. (It did participate in a joint naval exercise in September, 1977 however.) Moreover, Greece has been withholding all electronic input to the NADGE system (NATO Air Defence Ground Environment) from its five existing radar stations — three others are nearing completion — since 1974, and refuses to allow NATO to use its land cable communications links with Turkey across Greece.

There has been slow progress on the negotiations of a new arrangement between Athens and NATO, largely because the Greek government feels that with the passage of time anti-American feeling may die down and the situation with Turkey become less tense, thus permitting a more complete return to NATO. In January, 1977 however, Greece did finally provide NATO with a document defining the future relationship it seeks. This provided for national control over Greek forces in peacetime and during NATO military operations, although NATO would help decide the targets in the latter case. Athens reportedly also stipulated that Turkish forces might not use Greek territory or communications channels, nor any information from the Greek radar stations forming part of NADGE, and that the Greek armed forces be linked directly with NATO Southern headquarters in Naples rather than be involved in Greek–Turkish co-operation under the control of an American general based in Izmir. In May, 1977 Prime Minister Karamanlis added the further condition for a full Greek return to NATO of alliance help in settling the Cyprus problem.

A possible solution to the problem of Greek participation was worked out by the Greek Chief of Staff and NATO's Supreme Commander in Europe after the Izmir headquarters controlling land forces in south-eastern Europe and the Sixth Allied Tactical Air Force were handed over to Turkish command on June 30th, 1978 (since in practice it now only controls Turkish land forces and the Turkish First Tactical Air Force). Under this proposal a new and separate NATO headquarters commanded by Greek general officers would be established at Larisa in central Greece, to exercise control over Greek land forces and the 28th Greek Tactical Air Force on NATO's behalf. This would effectively mean the full return of Greece to NATO's military structure. In early 1979 approval of this plan was still being delayed by Turkey's insistence that the dispute with Greece over operational control of the airspace over the Aegean be resolved first, and Greece remained half-in, half-out of the alliance structure.

The special Greek defence relationship with the USA has also been greatly affected by the events of 1974. Unlike Turkey, Greece has not been subjected to an American arms embargo, and in 1976 it received \$225,000,000 in American military aid, but American bases have become as sensitive an issue as they are now in Turkey. After 18 months of negotiations a tentative agreement was reached at the end of 1976, which provided for the closure of three of the seven American bases in the country. The remaining four (the Sixth Fleet's air–naval support base at Suda Bay, Crete; the air force communications station at Iraklion, Crete; the Naval Commander centre at Nea Makri near Athens; and the USAF logistical support base at Hellenikon airport near Athens) would shift from American to Greek command, with up to 50% Greek personnel. The 4000 American servicemen in Greece lose their extraterritorial rights, and the USA ceases to have the right to conduct

World Armies

'combat operations' or to store nuclear weapons in any of these 'facilities', as the bases have been renamed. This new defence co-operation agreement was initialled in Athens on July 28th, 1977.

Formally, at least, the bases question in Greece has been kept separate from the issue of American military aid, which has continued since 1974 at about the customary level. At the end of 1977 the 4 year, \$700,000,000 special grant of military aid which was agreed between Greece and America on April 16th, 1977 had still to be ratified. Indeed, it may never be, as it was only concluded in response to the American-Turkish agreement of March 26th, 1977 providing for \$1,000,000,000 in American military aid over 4 years, in order to maintain the balance of armaments between the two Aegean NATO members. The American-Turkish aid agreement, intended to serve as a *quid pro quo* for the return to operational status of American bases in Turkey, had not been ratified by the American Congress at the time of writing, however, and the Greek government has stated that it only wishes the ratification of its own parallel agreement with the USA if the American-Turkish agreement goes into effect.

Deployment

Two of the three Greek army corps are located on the northern frontiers with Bulgaria and Turkey. The third, which covers the rest of the country, also provides the troops for the recently remilitarised islands along the Anatolian west coast. Total numbers deployed in these islands are not known, but there have been reports of over 10,000 in Rhodes alone. There are about two battalions of Greek army troops in Cyprus, serving as cadres in the Greek-Cypriot National Guard.

The major navy bases are at Piraeus, Salonika, Valos, Mitilini and Rhodes.

All 40 of Greece's new LTV A7 Corsair IIs are based at Suda Bay in Crete.

The general southward and eastward shift of the Greek defence forces naturally reflects the concern in Athens about a possible war with Turkey. In such a war, it is reckoned by both sides, major advances by either party would be unlikely along the Thracian border, nor would air strikes against bases and cities accomplish anything decisive. The focal point of such a war would unquestionably be the Aegean islands, especially the large ones only a few miles off the Turkish coast (but hundreds of miles from mainland Greece) which might be seized as hostages for a favourable peace. Fighting in such an area would be decided by air and naval engagements, and in view of the considerable range disadvantage Greek forces would suffer the trend towards forward basing of Greek forces is unsurprising.

Recent Operations

The Greek armed forces have not fought since 1949, with the exception of a contingent sent to the Korean war and the small number of Greek troops who were in Cyprus in 1963-74.

ORGANISATION

Arms of Service

The Greek army is primarily an infantry force, consisting of 11 infantry divisions, one armoured division and one armoured brigade, and 12 artillery battalions. There is also a paracommando brigade, a marine infantry brigade, two SSM battalions (with Honest John missiles), a SAM battalion, and 14 army aviation companies.

The tank division has six tank battalions of 55 tanks each, four motorised infantry battalions (750 men and 60 APCs) and reconnaissance battalions, three SP artillery battalions (18 105 mm SPs) and one mixed artillery battalion (10 SP howitzers of 155 mm and 203 mm), plus a combat engineer battalion, communications battalion, army air corps company and logistical support sub-unit. Total strength is 13,000 men and 360 tanks. The independent armoured brigade consists of two tank battalions, one motorised infantry battalion, one SP artillery battalion and other arms and services in proportion; total 3600 men and 119 tanks.

Greek infantry divisions closely resemble the motorised infantry formations of other NATO countries. There is a headquarters company plus three infantry regiments of three battalions each, and anti-tank, APC and Army Air Corps companies. The strength of a Greek infantry division can range up to 14,300 men, with 62 tanks, 80 APCs, 1800 vehicles, six airplanes, four helicopters, 76 howitzers of 203.2 mm, 155 mm and 105 mm, 114 mortars, 50 106 mm RCLs and up to 450 AT weapons. They are all trained for combat in both nuclear and non-nuclear conditions. Greek military concepts, doctrine and combat training are almost wholly American in origin.

The Greek air force is divided into Tactical, Training and Material Commands. It has a squadron organisation.

Operational

The armed forces are divided into three armies, two of which are located in northern (Thessalonika) and north-eastern Greece. The third army, headquarters Athens, controls forces in the rest of Greece and the islands.

RECRUITMENT, TRAINING AND RESERVES

Less than a quarter of the Army's strength — some 37,000 men — are long-service regulars, almost all of them officers, NCOs and specialist trades. The remainder of the army is made up of conscripts doing their compulsory 30 months' military service. Military liability continues from the 21st to the 50th year, with trained conscripts passing into the First Reserve for 19 years, and 10 years in the Second Reserve.

Recruit contingents are called up every 3 months. Since the rapid post-1974 expansion of the army the number of young men entering the appropriate age group each year has not been adequate to meet requirements, due to a birth rate that has been static for some time. Accordingly the Greek government introduced a bill in 1977 to open armed forces careers up for women (hitherto they had been restricted to the nursing corps), and to make women between the ages of twenty and thirty-two liable to compulsory military service for a period of 14 months. Married women, mothers of illegitimate children, nuns and orphans would be automatically exempted, but it was hoped that up to 12,000 women could be brought in each year, to serve in non-combatant positions and release men for combat duties.

EQUIPMENT AND ARMS INDUSTRY

The Greek army's armoured force consists of 300 M-47, 750 M-48 and 170 AMX-30 medium tanks, 170 M-24 light tanks and 180 M-8 armoured cars. It has 460 M-59, 520 M-113 and a number of Mowag APCs. Further AMX-30 tanks and a number of AMX-10P MICVs are on order from France. The artillery component is 100 75 mm pack howitzers, 80 105 mm and 240 155 mm howitzers and a considerable number of 105 mm, 155 mm, 175 mm and 203 mm SP guns/howitzers. It also has two battalions of Honest John SSMs (eight missiles).

Other weapons include 550 106 mm RCLs; SS-11, TOW and Milan anti-tank guided weapons; 40 mm, 75 mm and 90 mm AA guns; and one battalion (12 missiles) of Hawk SAMs. Army aviation has two Aero Commander, 20 U-17 and 15 L-21 aircraft, and five Bell 47G, 20 UH-1D and 42 AB-204/205 helicopters.

The main strength of the Greek navy is seven submarines, 12 destroyers, four destroyer escorts, 10 guided-missile fast patrol boats (eight with Exocet SSMs, two with SS-12 SSMs) and 16 fast torpedo boats. The navy also has two coastal minelayers, 13 coastal minesweepers, 16 landing ships (10 LST, five medium, one dock), 19 smaller landing craft, and two large and four small patrol craft. There is one squadron of four Alouette III helicopters which are soon to be equipped with French-built AM-39 air-to-surface missiles.

The Greek air force has 257 combat aircraft. There are six fighter-ground attack squadrons, two equipped with 38 F-4E and eight RF-4E Phantoms, three with 60 A-7H Corsair IIs, and one with 28 F-104Gs. The five interceptor squadrons are composed of three with 45 F-5A13s and two with 40 Mirage F1CGs. There is one reconnaissance squadron with 20 RF-84Fs and one maritime reconnaissance squadron with eight HU-16B albatrosses.

The air force also has two transport squadrons equipped with 28 C-47s, 12 C-130H Hercules, one Gulfstream and five CL-215 amphibians. Fifty Noratlas transports have recently been bought surplus from the Israeli air force. The three helicopter squadrons have 14 AB-205s, two AB-206s, 10 Bell 47Gs and 12 SH-19Ds. Training aircraft, some of them armed, include 60 T-33As, 20 T-41Ds, 18 T-37Bs, 8 F-5Bs and 40 T-2Es. There is one SAM battalion equipped with Nike Hercules missiles.

The ambitious programme for the re-equipment of the armed forces continues. The air force has on order a further 24 F-4E Phantoms and 300 Sidewinder air-to-air missiles from the USA. The navy has six destroyers, and a number of Exocet surface-to-surface missiles on order, and in April, 1977 signed an order for the construction of a further six guided-missile fast patrol boats of the La Combattante II class (it already has ten, eight of them carrying Exocet SSMs). The first two of this batch are to be built in France, for delivery in 1979, and the latter four in Hellenic Shipyards, thus giving Greece its first domestic warship-building experience. These vessels are to be armed with Norwegian-built Penguin SSMs; a large part of the cost is being met by the donations of Greek ship-owners.

Greece's domestic arms-building capability is at present not very great, but a parliamentary bill introduced in early 1977 provided assistance to State-owned and private factories manufacturing armaments in order to attract advanced foreign technology. The government explained that international political events had created new problems potentially affecting the regular supply of weapons, and it was announced that the government in collaboration with the heads of the three services had produced a draft plan for producing in Greece a large part of the necessary equipment and arms. The first result of this was the call for tenders for a new main battle tank to replace Greece's existing AMX-30s (which are suffering automotive problems) and its aged M-47/48s. Tenders were received in July, 1977 from France (offering improved AMX-30s and AMX-13s), Germany (Leopard I and Marder), Italy (Lion I, an improved Leopard I built under licence) and Britain (which offered either the Chieftain or the Vickers Mk. 14). The plan calls for the immediate purchase of a number of tanks, followed by the creation of a locally based plant which would assemble approximately 100 tanks a year, and also undertake the rebuilding and modernisation of Greece's existing M-47/48s. It is expected that the degree of offsets offered will be a major consideration in choosing the type of tank.

World Armies

RANK, DRESS AND DISTINCTIONS

Ranks follow the British system, and uniforms have always been closely similar to the British in colour and design. Recently, however, a uniform more American in style has been introduced.

A distinctive visual element in the Greek army are the Royal Guard, or *Evzones*. They wear traditional mountaineer dress, including the tasselled cap, embroidered waistcoat and pleated white *fustanella* skirt.

CURRENT DEVELOPMENTS

The likelihood of war with Turkey is not high, and has certainly declined considerably since 1974. It is, nevertheless, a matter of almost obsessive concern in Greece.

It can be said with some assurance that Greece would have lost such a war in 1974. The subsequent Greek arms build-up and the effects of the American arms embargo against Turkey (later lifted in May, 1978), have altered the balance to an appreciable extent, however, and there has also been a recovery in the morale of the Greek armed forces. While it remains virtually impossible for Greece to *win* a war with Turkey, since geography offers it few opportunities to strike at Turkish vital interests, it is now also improbable that Greece could *lose* such a war decisively in the limited amount of time that would likely be available before a ceasefire was imposed.

The likelihood of renewed military intervention in politics in Greece is also low at the moment, but it may show a tendency to rise again over the longer term. This would not be due so much to the admitted survival of some 'junta remnants' in the officer corps, if it should come about, as to a re-emergence of the kind of situation that existed in the mid-1960s. Despite occasional reports (from opposition circles) of coup plots within the army, the officer corps seems thoroughly loyal to the present constitutional regime, especially since it has the Turkish problem to keep it busy and a conservative government in Athens to reassure it. Popular anxiety about military intervention remains high (the movement of tanks through towns is still publicly notified in advance), but for the moment the officers corps seems thoroughly chastened by its experiences of 1967-74.

The fundamental anti-communism remains, and should Greek politics once again polarise and create a powerful leftist force (of which the 1977 elections gave some hint) then one can conceive of the army paying closer attention to politics. But the real relationship of Greek officers to their national political culture cannot be defined so narrowly: the clash of approved values and modes of behaviour is almost total. To the extent that army officers possess a professional orientation, they are attracted to order, co-operative effort, discipline, efficiency, hierarchy and an austere patriotism towards an idealised State. The Greek in the street (and in the government), on the other hand, thrives on conflict in every area of his private and public life, has minimal tolerance for formal rules or even for political stability, and at the same time is enmeshed in an ever-ramifying patronage network which provides the real framework on which the nation's affairs are conducted.

These conflicting perspectives combine with more specific factors to produce a profound alienation of the army from the élitist circles that dominate Greek democratic politics. A majority of army officers are recruited from the lower middle class (the sons of traders, shopkeepers, junior civil servants, etc.) and some from the relatively prosperous elements of the peasantry. A very high proportion are from the provinces. They tend to react towards the prosperity of the established political, professional and commercial *élite* with a mixture of envy and contempt. They respond variously and at different times by seeking advancement through affiliation with the civilian patronage systems that extend into the army, by seeking self-protection through joining together in the kind of secret and semi-secret societies which repeatedly emerge in the army, or by seeking to cleanse the civilian society by military rule.

The army's efficiency (at least relative to other Greek institutions) and freedom from the blatant patronage and exchange of favours which dominates all other sectors of Greek life, were achieved quite early, as indispensable conditions of its military effectiveness. It makes army officers despise the near-anarchy and shifting patronage constellations which usually pass for civilian control in Greece. (The politicians in return despise the soldiers as *stenocephalos* — narrow-headed or stupid.) The army is not so much right wing, as permanently tempted to impose that austere social discipline which is so utterly lacking in real Greek culture. Since none of this has changed since 1974, there is no reason to believe that the cycle of intervention and withdrawal has been finally and decisively broken.

GUATEMALA

HISTORY AND INTRODUCTION

Guatemala is the historical 'great power' of Central America, considerably bigger and more populous than any of its neighbours to the south. During the colonial era it was the centre of an isthmus-wide political jurisdiction, however loosely enforced, and its neighbours are still chronically suspicious of Guatemalan aspirations to reunification of the area. In fact, however, Guatemala's attention during the twentieth century has been focused almost entirely on its internal affairs and on relations with the USA, the two processes whose interactions define modern Guatemalan history. In this situation, the armed forces have virtually lost interest in external affairs and have become ever more deeply involved in internal security matters, so that they now constitute a corporate (if sometimes disguised) permanent government.

The great dividing line in Guatemalan history is 1944. Before that time it conformed entirely to the Central American pattern. Afterwards, it embarked on a course of radical political and social change which was largely sponsored by elements within the army's officer corps, and which was a precursor in various ways of the Cuban Revolution of Fidel Castro and of the reformist *peruanista* tendencies that emerged in various other Latin American armies in the course of the 1960s. While in Guatemala this pioneering phase of military radicalism was stifled within a decade, the after-effects of it are largely responsible for the fact that the country has been in a chronic state of low-level civil war since the middle 1960s, with a casualty toll of about 20,000 dead.

The early period of Guatemalan history was similar to that of other parts of Spanish America. Central America was conquered by Pedro de Alvarado and 300 Spanish soldiers, the decisive battle being won against Tecún Umán, chieftain of the Maya-Quiche Indians of Guatemala, in 1524. What is now Guatemala became the capital and most populous part of the Captaincy-General of Guatemala, extending from Chiapas and Tabasco provinces of modern Mexico down to the present Panamanian border, but lacking the mineral wealth of Mexico or the Andes it remained a backward and neglected area even by the standards of Spanish America. The intermarriage of Spanish settlers with the Indians of the Guatemala highlands gradually produced a mestizo population of European custom and culture, known as *ladinos*, who lived alongside an Indian population still speaking its own languages and pursuing its own customs.

This situation persists to the present day, although *ladino* has lost most of its racial connotations and is applied to anyone who speaks Spanish as his mother tongue and adopts European behaviour. Between 40 and 50% of Guatemalans may still be classified as Indians, speaking Spanish poorly or not at all and living largely traditional lives in Indian villages where land is held communally. Indians and *ladinos* live alongside each other throughout the central highlands (which contained 90% of the population until this century, and still are the home of the majority), but there is little social contact between the two groups. The densely settled provinces in the western half of the highlands all have large Indian majorities, while the provinces east of Guatemala City are predominantly *ladino*.

Guatemala achieved its independence in 1821 without effort of its own, as a consequence of the successful Mexican revolt against Spanish rule, but it then had to drive out a Mexican army of occupation in 1823. Within a few years it became part of the Central American Confederation, held together by the army of the Honduran General Francisco Morazán. The majority of the Guatemalan *élite* in this period were of conservative, and hence anti-federalist, political orientation, however, and the shaky confederation was destroyed in 1838 by a ragtag army of Guatemalans led by the illiterate *ladino* general Rafael Carrera, who ruled Guatemala with arbitrary ruthlessness until his death in 1865.

In so far as the chaotic politics of the isthmus at this time rose beyond the level of mere personal advantage, it ranged liberal, anticlerical, federalist elements in each national *élite* against conservative, church-oriented, separatist factions. Carrera fell into the latter group, and in the wars of mutual intervention on behalf of liberal or conservative factions in neighbouring countries which wracked Central America in mid-century he three times led Guatemalan armies against coalitions between El Salvador and Honduras: in 1839, 1850 and 1863. Each time he captured San Salvador, but withdrew after bringing friendly local factions to power.

Guatemalan armies up to this time, however, were totally amateur and *ad hoc* organisations. The foundation of a professional military tradition (in the service of a revived drive for Central American unification) was the work of Carrera's great liberal successor, General Justo Rufino Barrios, who seized power in 1870. He was a gifted ruler who has become the Guatemalan national hero; in 14 years of drastic reform he destroyed the Church's privileges, introduced commercial agriculture in the form of coffee estates and banana plantations, built roads and initiated a rail system.

Within a year of taking power, in 1871, he founded a regular national army, which proved its worth in yet another victorious war against El Salvador in 1876. In 1874 he created a national military academy, La Escuela Politécnica, in Guatemala City, which began to produce officers with proper professional qualifications. In the end, having failed to achieve regional reunification by diplomatic means, he proclaimed himself supreme commander of the 'Army of Central America' in 1885 to achieve his aims by force, only to be killed in the very first battle on the Salvadorean frontier. But

World Armies

although his forces collapsed upon his death, and Guatemala was ruled by a succession of other essentially civilian liberal politicians until 1898, Barrios had laid the groundwork for political domination of the country by real generals whose basic careers were in the army: between 1871 and the present, 18 out of 23 Guatemalan presidents have been military men.

The Escuela Politécnica survived, and produced a steady flow of 'school' officers who gradually raised the professional standards in an army largely commanded by 'line' officers who had received the traditional direct commissions from civilian life. By the turn of the century there was at least a portion of the officer corps for which the army was a career, and a French military mission was employed in improving the standard of training. In 1906 Guatemala fought its last international war, again against El Salvador; both sides were persuaded by Mexico and the USA to accept arbitration, and apart from some minor border clashes in 1935 there have been no serious conflicts between the two countries since then.

During most of the early part of the twentieth century Guatemala was ruled by two military dictators in the classical Latin American mould: men who exercised a highly arbitrary and personalistic rule that used the armed forces merely as one instrument of oppression amongst others. From 1898 to 1920 the country suffered under the brutal and primitive dictatorship of Manuel Estrada Cabrera. After a chaotic interim period in the 1920s the government was seized in 1931 by General Jorge Ubico, with decisive assistance from the USA. His rule, while equally arbitrary, was distinguished by an unusual degree of fiscal integrity and a quite unprecedented degree of centralisation: it was in the period 1931–44 that almost all local centres of power were subjugated to the government in Guatemala City. It has been observed that Guatemala during his reign resembled a 'model jail'.

Two of the consequences of Ubico's relatively efficient and honest rule, however, were largely responsible for the dramatic break with previous Guatemalan history that occurred in 1944. As a result of his public works projects — especially a vast expansion of transportation and communications facilities — his emphasis on economic development, and his expansion of the government bureaucracy, Ubico assisted in the great expansion of the middle class, especially in the capital where commerce, industry, the professions and government offices were all heavily concentrated. A self-conscious and comparatively large group of people emerged who were still totally excluded from power and ignored by the traditional ruling alliance of generals and great landowners.

Ubico's second important, though unwitting, contribution to the 1944 revolution was drastically to reform the military academy. At his request a United States army officer was appointed to command it in 1935, with instructions to 'make the Escuela Politécnica as near like West Point as was possible under conditions here'. Entrance requirements were greatly stiffened and competitive examinations replaced influence as the means of gaining a place; discipline was upgraded, the curriculum modernised, a merit system introduced and the academy considerably expanded. By the mid-1940s these reforms had produced a well-trained, professional junior officer corps, including a number of individuals of middle-class origin. Unsurprisingly, they found themselves dissatisfied with service in an army in which almost all the senior officers were their professional inferiors, promotion was solely by personal favour of the dictator, and there were 80 generals for 15,000 men.

The first revolution of 1944, in May–July, was the work of the new middle classes. The pro-democratic propaganda with which the Allies flooded Latin America during World War II, although directed at arousing hostility against the Fascist powers in Europe and Japan, had made old-style dictatorships like Ubico's seem obsolescent and inappropriate. Under the influence of a general strike which had succeeded in overthrowing the similar dictator Hernández Martínez in neighbouring El Salvador in April, 1944, university students in Guatemala City demanded certain changes within their own faculties. These were conceded, to everyone's surprise, and with the smell of victory in their nostrils the students rapidly escalated their demands. They were joined by professional and other middle-class groups in the capital in peaceful demonstrations culminating in a general strike — and Ubico went quietly.

He left behind him, however, a *junta* of three generals, from whom his handpicked Congress chose General Federico Ponce to serve as provisional President pending the organisation of free nationwide elections. The exultant students and their middle-class allies proceeded to create a multitude of political parties, and by August an intellectual, Juan José Arévalo, who had been abroad teaching at an Argentine university, had won the support of many of these parties with his vague doctrine of 'spiritual socialism'.

It was, however, the senior officers of the army acting through Ponce, together with their allies in the Congress and amongst the great land-owning families, who were really still in charge of Guatemala. They were playing an unusually subtle game, allowing free expression and a certain political effervescence in the belief that in due course it would blow itself out and eventually allow them to bring a candidate of their own preference to the Presidency through the familiar fixed elections. Arévalo's soaring popularity alarmed them, however, and by September Ponce's government was increasingly reverting to the old tactics of repression and assassination of opponents. It looked as though the Guatemalan revolution, like its model in El Salvador, was running into the sand.

What made Guatemala different was its large, disgruntled and professional junior officer corps. The old army was sufficiently aware of the danger to keep most academy graduates away from the capital — only six academy graduates of recent years held appointments in Guatemala City, and those included the provisional President's sons — but even those few were enough. On October 20th, 1944 the presidential guard was led in rebellion by two young officers, Major Francisco Javier Arana, commanding the army's one tank battalion, and Captain Jacobo Arbenz. Arms were distributed to students, and after a brief battle the outgunned loyal troops in the capital surrendered. All 80 generals were sent into exile and the rank was abolished. Arana and Arbenz formed a new *junta*, together with one civilian, which supervised the

elections of December, 1944 that duly brought Arévalo to the Presidency. Both coup leaders were promoted to colonel, the highest remaining army rank; Arana became Chief of the Armed Forces, and Arbenz became Minister of National Defence.

The young officers who led the coup of October, 1944 had no clearly formulated programme. Arbenz was a 'school' officer, and very popular with even more junior officers from his time as a lecturer at the academy, but Arana was a 'line' officer belonging intellectually to an older generation. The motives that moved them and their military supporters in 1944 were an amalgam of the idealistic — revulsion against Ubico's bloody though efficient rule, and an attraction towards the glowing future of liberty and prosperity promised by the intoxicated student revolutionaries after Ubico's fall — and the severely practical. Amongst the latter must be mentioned the very bad pay (newly commissioned lieutenants earned \$24 a month), the blockage in promotions caused by the huge top-hamper of generals and colonels, and the prospects of rapid advancement that invariably accompany a successful coup.

Arana and Arbenz duly achieved such promotion, and many of their own close associates also benefitted from promotion or government jobs. It should be noted, however, that throughout the 1944–54 period the officer corps as a corporate entity was not directly involved in the governing of the country, nor was a majority of its members active in politics. Officers benefitted generally from higher salaries, opportunities to study abroad, and promotions into the vacancies created by the purge of the senior ranks. They were generally favourably disposed to the regime's nationalist goals, however opposed many of the more conservative officers may have been to its social policies.

The presidency of Dr Arévalo, which began in early 1945 with such high hopes and with the support of a variety of revolutionary parties, proved unable to produce the miracles of reform that were looked for. Partly this can be attributed to Arévalo himself: he proved to be an agile survivor in the face of the dozen plots and attempted coups which were directed against him in 1945–9 and a master of political expediency, but his mystical variety of 'spiritual socialism' lacked a clear programme. Unions, free to organise and to strike at last, proliferated and spread, as did peasant organisations in the countryside, and a social security law and a labour code were enacted by Congress, but few really fundamental measures of reform were even attempted. The influence of powerful conservative groups was still great, and they found a protector, figurehead and prospective presidential candidate for 1951 in the semi-autonomous Chief of the Armed Forces, Colonel Arana. With the army still potentially the arbiter of politics, radical parties similarly offered to support the Minister of Defence, Colonel Arbenz.

Arana, who had operated as a brake on all government reform policies by his scarcely concealed willingness to contemplate a coup, was assassinated in 1949 by individuals associated with Arbenz. Some conservative officers in the army revolted in reaction to this event, but the bulk of the army remained obedient to the government and the revolt was crushed. Afterwards most remaining officers of an openly conservative disposition were purged, and Arbenz emerged as the undisputed power behind the throne. In the 1951 elections he succeeded Arévalo to the presidency.

Arbenz was much more determined and competent both as a social reformer and as a political organiser: he adopted really effective land reform as his basic goal, and actually began to carry it through. He nationalised the extensive holdings of the United Fruit Company virtually without compensation, thus appealing to the anti-American sentiments of almost every Guatemalan. But he made two great errors (although neither may have been avoidable): he allied himself too closely with the Guatemalan Communist Party, and he then continued to trust that the army would support him in all circumstances.

The Guatemalan Communist Party was small — in 1944 it had only a few hundred members, and even in 1954 it had only 4000 — and it had no illusions about being able to seize power through Arbenz in the foreseeable future. But it was remarkably well organised, and had complete control of the national trade union organisation and a dominant voice in the national peasant organisation by 1952, when it was finally legalised. Even in the coalition of 'revolutionary' parties which supported Arbenz's government it was much smaller than the two major parties, but it did hold the balance of power between them. Its members were relatively free from the scandal and corruption that were rotting the other parties after almost a decade in power, and Arbenz came to rely upon it quite heavily in certain areas: the application of the land reform measures, for example, was entrusted largely to the communists.

However necessary communist support may have been to Arbenz's policies at home, it inevitably spelled trouble with the USA, which was then at the height of its Cold War panic about communist infiltration in Latin America. Actions such as the nationalisation of American property in Guatemala and denunciation of United States policy in Latin America by diplomatic representatives of Guatemala were merely additional goads to American intervention; the mere fact of a legal Communist Party being represented in the Guatemalan government was sufficient in itself. During 1953 the United States Central Intelligence Agency began organising and arming exiled Guatemalan opposition elements under the command of Colonel Carlos Castillo Armas, a right-wing supporter of the assassinated Colonel Arana who had fled the country after leading an unsuccessful revolt in 1950.

As these preparations advanced President Arbenz was forced increasingly to rely upon communist support, which caused mounting concern in the army. Contrary to some assertions, the Communist Party never systematically attempted to gain a party of adherents in the army (although individual officers were members or sympathisers); it did, however, begin to infiltrate the police heavily, and made preparations for the arming of a peasants' and workers' militia in case the army should refuse to fight the expected invasion. During late 1953 and early 1954, as Arbenz was forced into a corner by the tide of events, the secret police began mass arrests of opposition figures, accompanied by brutal tortures and some murders, while various communist luminaries from other Latin American countries (including 'Che' Guevara of later fame) arrived to give him aid and advice.

World Armies

Castillo's 'Army of Liberation', numbering only a few hundred men, crossed the frontier from Honduras on June 18th, 1954, but was contained by loyal government forces after advancing only 20 miles. The popular uprising against Arbenz which he had hoped for failed to materialise, and he made no further advance until the issue had been decided in Guatemala City. The deciding factor there was not the army's hostility to Arbenz, much less its support for Castillo or the USA, but rather its anxiety about the intentions of the communists towards itself.

In a classic example of the self-fulfilling prophecy, the Communist Party's concern to guard against army disloyalty by creating an armed workers' and peasants' militia had created acute suspicions within the army that the communists were aiming to supplant the armed forces entirely, or even (in the more lurid versions) to massacre the officer corps. This professional jealousy had been raised to fever pitch by a shipment of arms which had arrived in Guatemala by ship from Poland the month before. Arbenz had only turned to a communist country for arms after being refused them everywhere else, and it was never clear whether they were intended for the militia, the army or even revolutionary forces in some neighbouring country, but the army suspected the worst and intercepted the shipment on the docks. Therefore when, on June 25th, Arbenz instructed his loyal Chief of the Armed Forces to furnish arms to paramilitary workers' groups and the revolutionary parties, the army refused to comply. On June 27th representatives of the officer corps met with Arbenz and demanded his resignation. He meekly complied.

All resistance at once collapsed, although Castillo's Army of Liberation did not at once proceed to the capital. Arbenz had lost much popular support through the damage done to living standards by his extreme economic nationalism, and the entire structure of government-supported mass organisations ceased to function almost at once, while the communists and most other members of the government took refuge in foreign embassies. It is important to note, however, that the army finally withdrew its support from Arbenz not because of his economic and social policies or even because of his communist support, but mainly over the essentially professional issue of preserving its monopoly of the national defence role.

This was borne out by all that followed. The army command strongly resisted the elevation of Colonel Castillo Armas to the Presidency, which was only achieved after a week's delay and under intense American pressure. The entire cadet corps of the *Politécnica* assaulted and beat up a small contingent of the 'Army of Liberation' shortly after it arrived in Guatemala City: some were sent home and others abroad on scholarships, and the *Politécnica* was closed for 2 years, but no overt disciplinary action could be taken against the cadets by Castillo because most of the officer corps saw the action as little short of heroic. There was great resentment in the regular army at the enforced integration of 'Army of Liberation' members into its ranks. In the eyes of most of the officer corps the entire episode was seen primarily as a humiliating demonstration of the United States' ability to manipulate Guatemalan affairs, and it was only by dint of the most stringent disciplinary measures, large-scale purges of officers and extremely alert intelligence services that the Castillo regime was able to survive.

Following a series of executions Castillo established himself in power, and had himself confirmed as president in an uncontested election in October, 1954. Unions and peasant organisations were effectively banned, left-wing politicians were hunted down and eliminated by the secret Committee of National Defence, and much of the land expropriated under the agrarian reform was returned to the large land-owners. Both for the enforcement of the retrograde land reform, and as a counterweight against the army, he relied heavily on the National Liberation Movement (MLN), an extreme right-wing private army composed mainly of smaller landowners from the country's eastern region. There was considerable economic aid from the USA, but basic social problems were neglected.

Castillo was assassinated by a reputedly communist palace guard in July, 1957 and a successor in the same mould who won a rigged election had to step aside after popular protests enjoying the army's support. The man who was chosen in the relatively honest re-run of the election in January, 1958 was General Miguel Ydígoras Fuentes, a former senior official under the ruthless dictator Ubico in the early 1940s.

Ydígoras was an extreme conservative, which probably attracted as many in the officer corps as it alienated others, but the decisive factor in winning him the army's support was that he was, at the outset, anti-American and ultra-nationalist. This relationship changed, however, after the emergence of Fidel Castro's regime in Cuba as an overtly communist government, for Ydígoras's extreme anti-communism led him to volunteer Guatemala to the USA as a training base for the Cuban exiles whom the CIA was training and equipping to overthrow Castro. This large Cuban force arrived at Retalhuleu on the Pacific coast of Guatemala in mid-1960 to train for the Bay of Pigs invasion that took place in the following year.

Even to the anti-communists who then, as always, predominated in the Guatemalan officer corps, this admission of United States-backed foreign forces to Guatemala was an extreme affront to national honour. Within months, on November 13th, 1960 a group of officers and men led by Colonel Rafael Sessan Pereira seized a barracks outside Guatemala City while another group succeeded in taking over the military base at Zacapa in eastern Guatemala and the Atlantic-coast port of Puerto Barrios. It took Ydígoras's government 4 days to quell the revolt, and he had to call on assistance from five United States naval vessels and from bomber aircraft piloted by Cuban exiles from the training base at Retalhuleu.

This incident marked the real start of Guatemala's chronic problem of guerrilla insurgency, for several of the young officers implicated in this abortive coup, after brief periods of exile in neighbouring countries, returned to provide the first generation of leadership for the leftist guerrilla movements that have operated ever since. (For a more thorough treatment of the genesis and course of the guerrilla war in Guatemala, see *Recent Operations*.) For Ydígoras, the use of these foreign forces was a step which irrevocably condemned him in the eyes of most officers. He survived an attempted revolt by a

faction of the Guatemalan air force in November, 1962 but was forced out by his own Minister of War, Colonel Enrique Peralta Azurdia, in March, 1963.

Peralta was himself an extreme conservative; indeed, one of the announced reasons for the coup was the fact that Ydígoras had allowed the former leftist president Juan Arévalo back into the country to run in the presidential election that was scheduled for December, 1963. (Ironically, the possibility that Arévalo might win the election was instrumental in providing United States support for the coup.) Peralta ruled Guatemala under state of siege until 1966, and it was under his regime that the subsequent and still subsisting real political system of the country was evolved and established.

By the early 1960s the army's corporate professional identity was fully established, and the period of direct military rule under Peralta convinced it that it was at least as fit to govern the country as its civilian rivals. Thanks in part to the politicising effect of the United States-supplied counter-insurgency training which so many Guatemalan officers received from the late 1950s on, the officer corps had a clear view of itself as the most coherent and selfless instrument for national development available to the country. Although it still had to deal with other powerful interest groups in the country, it was no longer their client; its resources and above all its unity and sense of purpose were comparatively so much greater that the relationship was reversed.

Thus it became the duty and responsibility of the army to take over the government of the country on a permanent basis — though constitutional forms would be observed, and even figurehead civilian presidents were permissible. Guatemalan politics since 1963 have effectively moved inside the armed forces: the 4000 strong private army of the MLN in the east which more openly espouses the cause of the extreme right, civilian forces (including the right-wing death squads), and even the left-wing guerrilla movements, can be seen essentially as instruments of factions within the officer corps.

Inside that exclusive group there remain a variety of ideological views, ranging from far-right to near-left. Indeed, even the *élite* on the far-left of Guatemalan politics may be considered part of the officer corps, except that those officers have taken off their uniforms and are leading guerrillas in the field. The entire spectrum of officer opinion is united by extreme nationalism, strong anti-Americanism (although the right wing has often had to suppress this sentiment in order to get aid in its struggle against the left) and an intense corporate bond. This bond is so strong that it has been reported that the guerrilla leader Yon Sosa came in from the bush on one occasion to attend an evening party given by members of his class (*promoción*) from the military academy, despite their official status as enemies.

It is simply not known how the shifting balance of advantage amongst the different ideological views within the Guatemalan officer corps is determined, although latterly it has seemed to be left largely to the decision of more or less free national elections amongst presidential candidates approved by the army. Thus the vehemently anti-American and ultra-right-wing government of Colonel Peralta was succeeded in 1966 by the elected government of Julio César Méndez Montenegro, a distinguished civilian law professor identified with the reformist cause. He had to agree, however, that the Defence Minister would be chosen by the army and would be responsible only to the army and not to him.

Within 4 months of his taking office the guerrilla threat, which had been growing through the early 1960s, became so acute that he had to declare a state of siege and hand most powers over to the army. The army also had to swallow its prejudice and permit United States troops (Green Berets and Ranger Special Forces) to assist the Guatemalan army in its intensive rural counter-insurgency operations. After 1968 the focus of guerrilla activities moved to the urban areas, but the intensity of the battle remained so high that army opinion shifted decisively in favour of a military president, the celebrated 'guerrilla-killer' Colonel Araña Osorio, in the 1970 elections.

Since 1972 the guerrilla and terrorist war in Guatemala has decreased markedly in intensity, and the concomitant slackening of the political tensions within the army was sufficiently great that the voters in the 1974 presidential elections were offered a choice of three generals: one conservative, one moderate and one liberal. The reputedly most conservative candidate, General Kjell Laugerud García, won, though only narrowly (and subsequently proved to be less right-wing than had been thought). This pattern of presenting the voters with a choice of officers may be becoming established, for it was repeated in 1978, when the presidential candidates were Colonel Enrique Peralta Azurdia (extreme right, Head of State 1963–6), General Romeo Lucas García (centre-right) and General Ricardo Peralta Méndez (centre-left). The victor, in a count which was as always disputed by the losers, was General Lucas García.

STRENGTH AND BUDGET

The strength of the Guatemalan armed forces is 14,270 men, or less than 0.25% of the population of 6,300,000. The army is by far the largest service, with 13,500 men. The air force, established in 1945, has 370 men, and the navy, founded in 1959, has 400 men (of whom 200 are marines). Paramilitary forces, consisting of the National Police Force and the Border Patrol, both of which are commanded by senior army officers on detached duty, number about 6000. There is a large reserve force, but its numbers are unknown and its mobilisation potential doubtful.

Defence expenditure in 1978 was \$58,500,000, amounting to about 1.2% of the GNP of \$4,600,000,000. Defence expenditure has remained at about 10% of the national budget, and around 1% of GNP, ever since 1946; previously, it was a much higher proportion. The manpower strength of the armed forces has remained almost the same since 1944, with occasional dips well below the present level, despite the tripling of the population in that period. As a result, expenditure per man has grown more rapidly than in any other Latin American armed force: between 1955 and 1965, it more than doubled.

World Armies

Since about 1962, the Guatemalan military budget has been supplemented by considerable amounts of United States aid. In the years 1950–61 total United States military grant assistance to Guatemala was only \$1,300,000; in the next 10 years the annual average of grant aid was greater than that, and was supplemented by about \$10,000,000 of United States military equipment furnished on credit under the Foreign Military Sales programme. The principal reason for this sharp rise in United States aid was the counter-insurgency war which the Guatemalan army was fighting in this period. In 1964, for example, United States Military Assistance Program aid accounted for 14.5% of all Guatemalan military expenditure. In more recent years, however, United States aid diminished in its relative importance, and since the United States Congress attempted to place conditions regarding the state of human rights in Guatemala on future military aid to the country in 1977, Guatemala has renounced all further United States assistance.

COMMAND AND CONSTITUTIONAL STATUS

The President of the Republic is identified in the 1966 Constitution as the commanding general of the army, which for constitutional purposes embraces all the armed services. He is elected to a 4 year term, and is ineligible for re-election. He appoints his own Cabinet without consultation with the legislature. The constitution contains a bill of rights guaranteeing the usual freedoms, but the frequently invoked Law of Public Order permits him to abrogate the rights and rule by decree by proclaiming any of four states of emergency ranging in severity from a 'state of prevention' to a total state of siege and war. Formal declaration of war, the conclusion of peace treaties, and the national budget (including defence) must receive Congressional assent, but in Guatemalan conditions this does not constitute an impediment to the President's power.

The President issues military instructions through the Minister of National Defence, who is invariably an army officer. The President is explicitly empowered to: decree mobilisation and demobilisation; grant promotions to all ranks of officers; confer military decorations and honours; and grant special pensions. There is a strictly consultative body, the Superior Council of National Defence, made up of the Minister of Defence and senior commanders, which advises the President on both military and political affairs and acts as the Superior Tribunal of the Armed Forces (the senior court of military justice). On operational military matters the President deals directly with the Minister of Defence and his Chief of Staff.

The constitution provides, however, that the army is to be governed principally by its own constitutive law and by military laws and regulations as approved by the Minister of National Defence, and in practice even soldier-presidents do not have total control over the army, which functions as a self-regulating body. The Minister of National Defence enjoys considerable autonomy: it is he who appoints the six military zone commanders and also the Commander of Reserves in each of the 22 departments of the country. The Commanders of Reserves are the military counterparts of the civil Governors appointed by the President, and in times of national emergency the Governors must yield their civil authority to these military officers.

The Army Chief of Staff exercises operational control over all the armed forces except the Palace and Presidential Guard, which receives its orders directly from the President. The Chief of Staff supervises the General Staff, which co-ordinates the policy, logistical and administrative functions of all three services. He controls the Territorial Commands which contain most of the operational units, and also the Special Commands and the Chiefs of Arms and Services.

The country is divided into six military zones, each including one or more of the 22 departments. Each military zone is commanded by a brigadier or colonel of one of the combat arms. These major territorial commands control the reserve structure in their areas, consisting of a Commander of Reserves in each department with basically administrative duties of controlling the reserve elements and the conscription organisation, but also with responsibility for some minor regular force units. The so-called Special Commands, which do not come under the authority of the zone commanders, are the Air Force, Navy, Military Forces Command, Military Bases Command and Military Education Centres.

The principal paramilitary forces are the National Police Force and the Border Patrol (*Guardia de Hacienda*), numbering about 5000 men and 1000 men, respectively. About two-thirds of the police are in the capital, with police responsibilities in rural areas being undertaken principally by the army. Most of the Border Patrol units are dispersed along the frontiers and coastlines.

The Director General of the National Police is usually a senior army officer on loan from the Department of Defence, as are numerous other supervisory officers in the force, and the force has a military-style organisation. The police command structure is composed of a small staff in charge of operational divisions in the central headquarters and the five regional zones outside the capital, thus coinciding with the army's territorial command structure. The Director General of the National Police reports directly to the Minister of Government on all operational and administrative matters, while the Chief of the Border Patrol reports to the Minister of the Treasury, but in periods of national emergency both are subordinate to the army high command, and local regional army commanders assume command of police elements within their areas. Both forces have played a large role in the counter-insurgency operations of the past 15 years.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

The 1966 Constitution states that the military establishment 'is designed to maintain the independence, sovereignty, and

the honour of the nation, the integrity of its territory, and peace within the republic'. In practice the army has had little concern for the defence of the country's territorial boundaries in recent decades, and has been preoccupied almost entirely with the maintenance of internal security. Since 1962 it has been engaged in continuous military operations against an active and powerful guerrilla movement operating both in the countryside and within the cities. Starting at about the same date, it has assumed the additional role of being the effective government of the country, and has had to acquire new skills and devote much attention to the new tasks which this role entails.

Guatemala has no serious outstanding border disputes with its neighbours to the south, Honduras and El Salvador, although the latter retains a lingering suspicion about Guatemalan pretensions to leadership in Central America. The border with its huge neighbour to the north, Mexico, is well defined, and sparsely populated on both sides along most of its length; it has never been a cause of dispute. A dispute with Mexico over fishing rights in coastal waters in 1959 actually led to shots being exchanged and a temporary break in diplomatic relations, but the breach has long since been repaired. In terms of external enemies, there is no one in sight for the Guatemalan army to defend the country against.

There is, however, an extremely serious border dispute with the British colony of Belize to the east, since Guatemala formally claims that entire territory. Belize's population of 175,000 is predominantly of Caribbean origin and English-speaking, and the territory has been under British control for over three centuries, but Britain's presence there was never formally recognised by Spain. After Guatemala achieved its independence a treaty was concluded with Britain in 1859 in which the present frontier was agreed, on condition that Britain construct a road across Belize linking Guatemala with the Atlantic. This condition was never fulfilled, however, and since 1945 all Guatemalan constitutions have stated that Belize is part of the national territory, and that all Belizeans are Guatemalan citizens.

Partly because of its potential as a diversionary tactic in times of political crisis within Guatemala, the claim to Belize has now become a major element in Guatemalan nationalism. There have been repeated sabre-rattling incidents in which Guatemala has threatened to invade Belize, and a pattern has developed in which the normal British garrison of about 1500 troops in Belize has to be urgently reinforced on a temporary basis every 2 or 3 years — as in 1972, 1975 and 1977 — in response to bellicose statements in Guatemala City. This threat tends to be the particular prerogative of the extreme right, and there have been occasions in which the private army of the National Liberation Movement has offered to invade Belize from its stronghold in the neighbouring eastern provinces of Guatemala if the regular army were not up to the job.

Belize has had full internal self-government since 1964 and is now developing its own defence force alongside the British garrison, but the natural transition to independence has been indefinitely stalled by this problem. Britain, having no wish to engage in a war with Guatemala, is unwilling to give a defence guarantee after independence, while the Belizeans dare not accept independence without it. Various other military solutions such as a defence guarantee from the other English-speaking States of the Caribbean have been canvassed — and Cuba has made an unsolicited offer of a military guarantee to an independent Belize — but in recent years most effort has gone into negotiations between Britain and Guatemala seeking a diplomatic solution to the problem. During late 1977 to early 1978 Britain unilaterally proposed to cede Guatemala about one-quarter of Belize's 8000 square miles, including the areas containing most of the territory's mineral resources, in return for Guatemalan recognition of independence for the remainder, but the Belizean government naturally refused to countenance such an arrangement, and the negotiations ended inconclusively.

The question of recognition of Belize's right to independence has now become a litmus test of Guatemala's relations with its Central American neighbours. In recent years even, most of the Latin American nations of the Caribbean have espoused the cause of Belizean independence: Mexico, Venezuela, Colombia, Panamá and Costa Rica have done so openly, and Honduras is also favourably disposed to it. Guatemala's only remaining supporters are its fellow right-wing governments in El Salvador (which has promised Guatemala military aid in the event of a war over Belize) and Nicaragua. On the other hand Mexico, which has a dormant claim to northern Belize, has stated that while it is willing to waive it if Belize becomes independent, it would reactivate it if Guatemala attempted to annex the colony. No early solution of the Belize dispute is likely, therefore, and Guatemalan ultra-nationalists will doubtless continue to exploit it to the accompaniment of sporadic military alarms, but no hostilities over the issue are likely either. Only one Guatemalan army battalion is normally stationed along the Belize border.

In addition to its membership in the United Nations and the Organisation of American States, Guatemala has had senior officer representation since 1945 on the Inter-American Defence Board, the military planning organisation affiliated to the OAS. It is a member of the Organisation of Central American States, established in 1962, and Guatemala City is the headquarters for the permanent joint military staff of the Council for Central American Defence (CONDECA), the military branch of this organisation founded in 1963 with the participation of all the nations of the isthmus except Panamá and Costa Rica. Both CONDECA and its parent organisation OCAS liaise with their hemispheric counterparts, the Inter-American Defence Board and the OAS, but they are independent organisations. During the mid-1960s CONDECA conducted a series of joint exercises under United States aegis, concentrating on counter-guerrilla operations, but this form of co-operation has since lapsed. Indeed, with the emergence of a more radical form of military government in Honduras, CONDECA has now effectively become an alliance between the right-wing States of Guatemala, El Salvador and Nicaragua.

This alliance does have a certain military potential, but it is in the area of intervention by one government's armed forces against an internal threat to an allied government, and would probably not be conducted under the auspices of CONDECA. There have allegedly been minor instances of this sort of mutual military aid in the past, as when Guatemalan air

World Armies

force planes were reportedly used to bomb rebels advancing to the capital of El Salvador in 1972, and there was speculation that similar assistance in larger quantities might be provided by Guatemala and El Salvador to the beleaguered Nicaraguan government during the 1978 civil war if the military situation required it.

It is by no means certain that the Guatemalan army would actually extend such assistance, however, although it now has the military airlift capacity to do so quite quickly. A decision would mainly depend on the balance between right-wing and moderate forces within the army at the time it had to be made. There are no Guatemalan troops deployed beyond the national borders at the moment, and there remains an extreme aversion to the possibility of foreign troops, however friendly, being based on Guatemalan soil.

Recent Operations

The Guatemalan army's principal concern for the past two decades has not been the country's neighbours but its internal security situation. Since 1962 it has been involved in continuous large-scale counter-insurgency operations, with a death toll (mostly civilians and guerrillas) that undoubtedly exceeds 20,000 by now, and could be a good deal more. The rural violence actually began in the east of the country in the 1950s, when peasant resistance to the repossession by landowners of lands which had been expropriated under Arbenz's government was crushed by private right-wing armies, notably the MLN, but the start of true guerrilla warfare dates from shortly after the November 13th, 1960 military revolt against the government of President Ydígoras Fuentes. It was a typically nationalist revolt, triggered by army resentment at the presence of a Cuban exile military training camp under United States control on Guatemalan soil, although it would be true to say that most of the officers involved in it were basically more sympathetic to Arbenz than to his ultraconservative successors.

One group of rebels seized Fort Matamoros near Guatemala City, killing some loyal officers and escaping with troops and armaments; the other seized the military base of Zacapa and the major port of Puerto Barrios in the east of the country, and held them for 4 days before being dislodged by government troops supported by Cuban exiles flying bombing missions and by the United States navy. The defeated rebels escaped into Mexico, Honduras and El Salvador, but within 4 months some were back in the country seeking to found rural guerrilla movements. The most prominent were Lieutenants Marco Antonio Yon Sosa (of Chinese extraction) and Luís Augusto Turcios Lima, both of whom had already received training in counter-insurgency tactics from the United States army.

At first these young officers had no Marxist connections at all, and the guerrilla movements they set up in Zacapa and the Sierra de las Minas in the east of the country were intended to serve as the nucleus for a general uprising and the immediate overthrow of Ydígoras. There was indeed a rapid rise in bloody popular disturbances during the following 2 months, but then Ydígoras effectively gave in to the army and filled all his Cabinet posts with regular officers (a year before he was formally overthrown). The guerrilla leaders were thus forced to consider a longer-term strategy, and to seek civilian political allies. In late 1962 both Yon Sosa's MR-13 and Turcios Lima's separate but allied group agreed to an alliance with the underground Guatemalan Communist Party under the name *Fuerzas Armadas Rebeldes* (FAR — Insurgent Armed Forces).

It should be stressed, however, that the Communist Party never had any control over the guerrilla groups, nor was it ever committed solely to the military seizure of power. Like most Latin American communist parties of that time it was wedded to the Soviet doctrine that a 'bourgeois revolution' must come before a socialist one, and that its place would be as a legal party in a leftist coalition, giving history an occasional push in the right direction. For the communists, the guerrillas were mainly a means of bringing pressure on the existing system in order to achieve that intermediate stage. Neither guerrilla leader was ever really a communist, although Turcios Lima finished up in an ideological position very near Castro's at the end of his political self-education. Yon Sosa, in contrast, conducted a lengthy flirtation with the Trotskyites of the Fourth International in 1964–6, and effectively held his MR-13 organisation separate from the FAR. But neither political association proved satisfactory to the young officers leading the guerrilla movements, whose pragmatically evolved revolutionary ideology did not fit into either the Trotskyist or the communist doctrinal straitjackets, and whose essentially nationalist orientation put them more in the tradition of Arbenz and of the Nicaraguan guerrilla leader Augusto Sandino (see Nicaragua, History and Introduction) than in that of Marx, Lenin and Mao. In 1967 MR-13 was reabsorbed within the FAR, with Yon Sosa, totally disillusioned with the Trotskyists, in overall command. Early in 1968 the FAR as a whole, irritated beyond endurance at the Guatemalan Communist Party's adherence to the Moscow line of de-emphasising guerrilla struggle in Latin America, denounced its alliance with the communists in the bitterest of terms.

By this time the guerrillas had grown to represent a major threat to the survival of the Guatemalan regime, but as a result they were also coming under far greater pressure than before. The years 1963–4 had been occupied in the gradual construction of guerrilla base areas (*focos*), primarily in the three easternmost provinces of Izabal, Zacapa and Chiquimula, and in 'armed propaganda' amongst the generally receptive peasant population, but by 1965–6 the guerrillas were expanding into new rural areas and had begun to carry out operations in the capital. In November, 1966 shortly after the inauguration of the elected civilian president Julio Méndez Montenegro, he was compelled to declare a state of siege, effectively hand control over to the army, and to call in United States Green Berets and Ranger Special Forces to assist in an all-out counter-insurgency campaign. Unfortunately for the guerrillas of the FAR (at that time still at odds with the smaller MR-13), their leader Turcios Lima had been killed in a car accident in Guatemala City the month before, and his successor César Montes was a civilian who lacked the former's extensive contacts within the army.

Colonel Carlos Araña Osorio, an extremely ruthless commander, was placed in charge of Zacapa province and given half the Guatemalan army plus United States Special Forces units. He also created and armed unofficial vigilante groups who were given *carte blanche* to use the most extreme methods in eradicating 'communist sympathisers' and extracting intelligence from the local peasantry. (These groups gradually coalesced into two main anti-communist organisations, the *Mano Blanco* ('White Hand') and the *Consejo Anti-Comunista de Guatemala* (CODEG) which survive to the present day and are the authors of most of the extreme right-wing terrorism and death-squad activities). Araña then proceeded to fight a remarkably successful counter-insurgency campaign in the east in 1966–8, forcing the guerrillas onto the defensive, cutting into their strength severely and keeping them continuously on the run. The estimated cost of his search-and-destroy methods in 2 years was 4000 deaths, of whom the great majority were innocent peasants; 28 United States soldiers were also killed.

By 1968 the guerrillas had been forced to move most of their operations into the cities: in January, 1968 they succeeded in killing the United States military and naval attachés, and in August the American ambassador was killed while resisting a kidnap attempt. The right-wing death squads replied with indiscriminate murder of anyone known or suspected to be sympathetic to the left: it was known that numbers of army officers were involved in their activities, but the extent to which the army high command secretly encouraged their activities is unknown. During 1969 and 1970 this war of mutual assassination turned into the chronic problem, costing over a thousand lives a year, which has plagued Guatemala ever since (in 1970 the FAR even kidnapped and murdered the West German ambassador), and which has effectively stultified any responsible political initiative from either left or right.

During 1969 and 1970 the FAR, having effectively lost its old bases in the eastern provinces, began trying to move into the countryside once more, this time in the Pacific coastal province of Escuintla, the predominantly Indian areas in the western highlands around Quetzaltenango, and along the Mexican border. It was there that Yon Sosa was killed in 1970 in a clash with Mexican troops, leaving César Montes in command of the FAR. In the same year Colonel Araña Osorio, famed as the 'guerrilla killer', was elected to the presidency. He set about applying the tactics he had employed in Zacapa to the elimination of the rural guerrilla movement nationwide (this time without United States troops in support), and by the end of 1973 he had substantially succeeded.

However, like the war of assassination by the right against the left, the rural guerrilla struggle has now become ingrown. In 1975 there was a resurgence of guerrilla activities in three of the previously affected areas: Zacapa–Chiquimula, west of Guatemala City, and along the Mexican border. The FAR was now known as the Guerrilla Army of the Poor (EGP), but it was essentially the same organisation, back in such strength that it was necessary for the Guatemalan army to conduct joint operations with the Honduran army in the Zacapa and Chiquimula foothills during 1975. Rural operations continued at a lower level in 1976 and 1977.

In early 1979 the EGP was estimated at 300 combatants, still commanded by César Montes, and organised in four different commands. The one urban command was in Guatemala City, and of the three rural commands the strongest was in the mountainous Indian areas north-west of the capital. A second had been re-established in Escuintla on the tropical Pacific coast, and the weakest was in Zacapa. The EGP unit in the capital was co-operating closely with the communists, although tensions between the guerrillas and the communists still remain. There is absolutely no sign that the guerrillas can overthrow the army-dominated government, or that the army can permanently eradicate the guerrillas; the country seems doomed to a low-level war of assassination, guerrilla attacks and counter-insurgency operations for the foreseeable future. Between June and November, 1978 a total of 770 bodies bearing the marks of torture were found in various parts of Guatemala; in January, 1979 a Christian Democratic politician, Alberto Fuentes Mohr, was murdered in the capital, probably by a death squad of the extreme right.

ORGANISATION

Arms of Service

The military establishment as a whole is divided into the active duty components (*Fuerza Permanente*) and a large reserve. The combat arms of the regular force are the infantry, cavalry, artillery, engineers, air force and navy. (The latter two, though enjoying a considerable organisational independence, are ultimately considered to be part of a single armed force, which by sheer strength of numbers is really the army.) There are the usual service corps such as ordnance, military police, medical, and so on. Each branch is headed by a Chief of Arm or Service who is directly subordinate to the Chief of Staff.

Operational

The Guatemalan army consists of 10 infantry battalions, one Presidential Guard battalion, one paratroop battalion, one engineer battalion, one armoured car company and nine artillery batteries. There is a potential brigade structure, with three brigade headquarters in existence, but for internal security operations most units are distributed amongst the six zone commands.

World Armies

The navy operates on both coasts, and for most purposes is responsible to the local army zone command. It includes a Marine rifle company. The air force consists of one fighter—ground attack squadron, one transport squadron and one communications squadron. The principal air bases are at La Aurora near the capital, Puerto Barrios on the Atlantic coast, and Puerto San José on the Pacific coast.

RECRUITMENT, TRAINING AND RESERVES

By law all male citizens between the ages of eighteen and fifty have an obligation to perform military service, but most are permitted to discharge this by service in the reserves between the ages of eighteen and thirty. Only about 5% of the estimated 60,000 men who register for military service each year on reaching eighteen are actually inducted into the regular forces; of these the great majority are Indians, and only a few *ladinos*. The term of service in the infantry and some other branches with low technical requirements is 1 year; in most of the others, 2 years.

Draft intakes are received four times a year. After the preliminary selection and medical examination have been carried out by the Commander of Reserves in each department, recruits are lined up by height and selected by representatives of the various arms. The Palace Guard gets the first choice, followed by the artillery, cavalry, infantry, engineers, air force and the various services, in that order. Basic training, including weaponry, physical education and instruction in elementary Spanish for the substantial proportion of recruits who do not speak it, is done in the special recruit centres, and usually lasts 16 weeks. Since 1945 the army has maintained a Literacy Department, and puts great emphasis on teaching all its recruits to read and write Spanish, but this instruction does not commence until they reach their units. Those who are already literate and have some education will be selected for assignments demanding higher technical skills; the actual instruction is usually provided by on-the-job training within the units.

Until the 1960s the Guatemalan army had always deliberately limited the numbers and responsibilities of senior NCOs for fear that they might become an institution which could challenge the position of the officer corps: most volunteers were allowed only one re-enlistment and few advanced beyond corporal's rank. The greater technical and operational demands on the army in the past two decades have caused this situation to change, however, and now three-quarters of army personnel are long-service volunteers. *Ladinos* in particular are encouraged to volunteer at the end of their obligatory service, and pay for volunteers has been made competitive with the civilian economy. The Guatemalan army now has about the usual proportion of enlisted personnel serving in the various sergeant ranks, and regulations provide for a career of up to 20 years. Non-commissioned officers' academies have been opened within the country, and numbers of NCOs also attend the United States Army School of the Americas in Panamá for technical training.

Officer recruitment is primarily through the *Escuela Politécnica*, to which cadets who have been successful in competitive examinations administered in each department of Guatemala are admitted at the age of fourteen or fifteen. They are now mostly drawn from middle-class families, and the proportion of cadets drawn from military families is lower than average for Latin American armies.

Graduates of the 4 year course at the Military Academy are granted a diploma in Science and Letters, commissioned as second-lieutenants in the infantry, and immediately posted to operational units. After 2 years' infantry service they may apply to transfer to other arms or services, including the air force and navy. Most air force pilots are trained to fly in the USA, with a few going to Venezuela or Mexico; the majority of naval officers receive their specialist training in Guatemala, but some have attended the Venezuelan or Argentine naval academies. Some officers, with diplomas good enough to qualify for university entrance, take degrees in such fields as medicine and law. Graduates of the Guatemalan or foreign military academies are known as *de escuela* (from the school); the few who are promoted from the ranks are known as *de línea* (from the line).

Post-academy training of army officers is provided by the School of Applied Tactics (*Escuela de Aplicación*), founded in 1941, which offers a variety of combat arms courses for all officer grades. Approximately 80% of company-grade officers are qualified parachutists, and a large majority of officers also attend professional courses abroad. In the past most of these have gone to United States army schools in the USA or the Panama Canal Zone, but others have gone to France, Italy, Spain, West Germany, Mexico and Argentina.

One of the striking features of the Guatemalan army is the extraordinarily strong corporate identity of the officer corps, which is reinforced by the institutions of the *promoción* and *centenario*. The members of each year's graduating class at the Military Academy (*promoción*) recognise a special loyalty to each other throughout their careers, exchanging mutual favours and making allowances for shortcomings in a way that would not normally occur between members of different *promociones*. The *centenario* relationship is a similar, even stronger bond between two individuals, generally 2 or 3 years apart in seniority, who share the same last two digits in the consecutive numbers which are assigned to all cadets entering the Academy — say, 543 and 643. The elder of the two is particularly responsible for the younger's welfare throughout his service career. These special loyalties will frequently take priority over factional and political divisions within the officer corps.

One factor that tends to vitiate the strong corporate bond of the officer corps, however, is the inadequate pay which is received by all ranks: it is expected that an officer will seek additional income beyond the base pay for his grade. The two principal ways of achieving this are to acquire one of the limited number of military appointments which carries with it a

sobresueldo — an additional stipend — or to engage in private enterprise, which is perfectly permissible except that officers may not own liquor factories or run night clubs. Most officers in fact choose to invest in land, or if possible to obtain land by official grant in the lightly populated colonisation areas, supplementing their incomes with the rent obtained. Both these solutions, however, are highly conducive to power-seeking and influence-peddling within the army, and may be as important as political ideology in shaping its internal factions.

In addition to its normal training activities, the army when not engaged in active combat operations devotes considerable time and effort to civic-action projects. These include the provision of school lunches and the construction of schools, road construction (a major activity of engineer units), the regular dispatch of medical teams to villages in remote areas, and work connected with opening up for settlement the practically uninhabited northern province of El Petén, which occupies over one-fourth of the national area.

By law reservists — that is, everyone eligible for military service at eighteen who is not inducted into the regular army — must train every weekend in the first year, one weekend per month in the second year, every 3 months in the third year, and every 6 months in the fourth. Regular army units in the area are responsible for providing the training programme, and the reserve structure in each department is supervised by the local Commander of Reserves. Two federally subsidised schools give military instruction to high-school graduates and grant them reserve commissions as second-lieutenants. These provisions are not invariably observed, however, and the amount of training received by reservists seems inadequate to make them very useful militarily. The mobilisation system, such as it is, is not tested in practice.

EQUIPMENT AND ARMS INDUSTRY

The Guatemalan army is primarily an infantry force, but it has eight AMX-13 light tanks and eight M-8 armoured cars. It also has six M-3AI, 10M-113, 10RBY-1 and seven Commando APCs. Its artillery strength is 12 75mm and 12 105mm howitzers, and some 81mm and 12 4.2in mortars. It has 10 40mm AA guns.

The Guatemalan navy has 11 small patrol vessels (under 100 tons), seven landingcraft, five service vessels and two yachts. The air force's combat aircraft strength is 11 A-37Bs. Its transport squadron flies one DC-6, nine C-47 and 10 IAI Arava aircraft suitable for dropping paratroops. The communications squadron has six Cessna 172, three Cessna 180 and two Cessna U-206C aircraft, and nine Bell UH-1D helicopters.

There is no domestic arms industry in Guatemala. The overwhelming bulk of its arms purchases over the past 20 years has been from the USA, but in view of recent political disputes with that source the Guatemalan government is increasingly looking for alternative arms suppliers; the two from which weapons have actually been bought are France and Israel. Despite its renunciation of United States military aid, Guatemala is still prepared to buy United States arms on a commercial basis: during late 1978 it sought United States government permission to buy six F-5E Tiger II fighter aircraft, but was refused by the Carter administration. Guatemala is now negotiating to buy a small number of Kfir-C2 fighters from Israel.

RANK, DRESS AND DISTINCTIONS

Ranks and insignia of rank have been standardised within all the members of CONDECA, including Guatemala, and are similar to those of the United States army. All ranks above colonel were abolished in the Guatemalan army in 1944, but the rank of brigadier-general was reinstated in 1968 and is now the highest rank held by serving officers.

Guatemalan troops wear khaki shirts and trousers and peaked caps for both work and dress uniforms; field uniforms are of American pattern. In addition to garrison uniforms similar to those of the enlisted ranks, Guatemalan officers wear an olive-green woollen gabardine uniform of roll collar jacket and trousers. Dress uniforms for officers are dark blue, with a gold belt and narrow gold stripes down the trouser legs. Officers' rank insignia are worn on shoulder-boards, or on shirt collars when no jacket is worn.

Air force personnel wear the same rank insignia, but have light-blue uniforms similar to those of the United States air force. Navy personnel have both dark-blue and white uniforms, of the usual naval cut.

All officer promotions must be approved by the President, and appointments to general officer rank by the Congress. Promotions are regulated according to time in grade, type of assignments, training qualifications, and merit. Retirement is compulsory at the age of fifty-five.

The highest military decoration in Guatemala, presented only by the President, is the Order of the Quetzal in the grade of the Grand Cross (*La Orden del Quetzal en la grado do Gran Cruz*). Other decorations, in order of precedence, are: the Cross of Military Merit, grades I, II and III; the Cross of Distinguished Services; and the Medal of Achievement in the Services.

CURRENT DEVELOPMENTS

With the doubtful benefit of hindsight it has become commonplace to impute to the military revolutionaries of 1944 (and

World Armies

likewise to their successors of the 1960s) motives, ideologies and programmes which they did not then possess. Thus the Arbenz of 1954, with his close alliance with the Communist Party and his hemispheric status as a sort of proto-Castro, is confused with the young Captain Arbenz of 1944. Similarly the Trotskyite guerrilla leader Yon Sosa and his pro-Peking ally Turcios Lima of the Fuerzas Armadas Rebeldes in, say, 1965, are confused with the two naïve young army lieutenants who took part in the abortive nationalist coup of November 13th, 1960. This misconception has then been extrapolated to reach the unwarranted conclusion that the junior 'school'-trained officer corps of the Guatemalan army was a secret hotbed of Marxist revolutionaries. Nothing could be further from the truth. Arbenz was no more than an ambitious young nationalist with reformist sympathies in 1944. The only places where Yon Sosa and Turcios Lima could have been systematically exposed to Marxist ideology prior to their part in the 1960 revolt (when they were respectively twenty-two and nineteen) was in the anti-communist indoctrination courses given at the Guatemalan military academy which they had entered at the age of fifteen, or in the United States army counter-insurgency courses which they subsequently attended at Fort Gulick in the Canal Zone and Fort Benning, Georgia. The Guatemalan army was indeed changing its character and its role rapidly in this period, but it was not corporately becoming a radical force. Rather, it was acquiring a consciously professional officer corps, increasingly confident of its own political abilities and increasingly nationalist in ideology. One of the first big changes in the army after 1944 was that 'line' officers who were still young enough were encouraged to attend the academy to acquire a professional training. It is true that the post-1940 'school' officers, being on average better educated and frequently of middle-class origins (not to mention being younger) did tend to have a more reformist and interventionist attitude to politics, but that does not mean they shared a common ideology.

What they did share, apart from ambition to better their own and the army's status, was a desire to build a more modern, more powerful Guatemala, less vulnerable to external (American) intervention. For many this did lead to the conclusion that the stranglehold of the old social structure must be broken, and that drastic reforms were required to set free the energies of the nation. Even if for some this in turn led to a leftist political orientation, it was more often social reform in the service of national power and independence than the other way around. By the later 1960s, the most common view in the officer corps (now almost all 'school'-trained) was that the army was the most effective force for modernisation and the most trustworthy guarantor of political stability in the country, and that it was fully competent to rule Guatemala. The old alliances between the army and other powerful groups in society became much less equal, and the army arrogated to itself the corporate role of (sometimes disguised) leading political force in the country. This is quite different from the old individualistic model of military dictatorship, and has developed into a system with considerable stability.

This sort of development is scarcely unknown in other Latin American armies in recent years — Peru and Brazil spring to mind, on the left and the right, respectively — so the obvious questions arise: why did Guatemala experience the entirely untypical events of 1944–54, and why did it continue to produce young officers capable of changing rapidly into Marxist guerrilla leaders right through the 1960s?

The answer is probably a matter of dates. The Guatemalan revolution of 1944 was not predestined to follow the course it traced up to the disaster of 1954, but it could only take that path at all because it was the first such revolution in Latin America. In subsequent cases where similar potentialities existed, local conservative forces or the USA were alerted and could move decisively to stop things in time. Once the model of an even temporarily successful left-wing nationalist government had been demonstrated in Guatemala, however, it could not be forgotten in less than a generation, and so the goals and methods that were espoused under Arbenz in the early 1950s are still widely disseminated, in a much more vivid fashion than in countries where they remain pure speculation, waiting to be adopted by dissatisfied young officers in search of a cause or a lever.

The number of such young officers within the army is now much smaller than it used to be, however, for 15 years of guerrilla war against Marxists has shifted the spectrum of political opinion inside the army a considerable distance back towards the right. The officer corps remains an ultra-nationalist (and therefore essentially anti-American) body of men, but a large number of officers have renewed or strengthened the traditional close connection with the economically dominant and politically right-wing factions of Guatemalan civilian society. Factionalism inside the army continues to be restrained by the very powerful instinct for corporate solidarity amongst the officer corps, and is further contained within bounds by the realisation that only a united army can continue to exercise effective rule over the country as it does at present.

There is little prospect that the army will voluntarily withdraw from this role, since it conceives of itself as an efficient instrument for national development (and enjoys many privileges as a result of its prominence). Neither is the army likely to split irremediably on factional lines. As for the continuing guerrilla challenge, it is unlikely to achieve major success in the foreseeable future, as the Guatemalan army is now probably the most effective fighting force in Central America, with high professional expertise in counter-insurgency operations.

GWYNNE DYER

GUINEA (Conakry)*

History and Introduction

Guinea rejected French Community membership terms in 1958, opting for a complete independence even at the cost of all links with France. The cost proved to be very considerable, and has been made worse by a poor level of economic performance under a regime of austere xenophobic Marxist socialism. The government of Guinea, since 1958, has been in the hands of President Sékou Touré. Various plots to overthrow him have been reported and others have been alleged. These have often been followed by purges and trials, sometimes followed by executions, the most recent occurring in 1969, 1971, 1973 and 1976. In recent plots the complicity of Senegal and the Ivory Coast has been alleged.

A Soviet maritime reconnaissance squadron is based on Conakry.

Strength and Budget

Population: 4,750,000 (approximately)

Armed forces: 5000 (army), 350 (navy) and 300 (air force)

GNP (1972 estimate): \$410,000,000

Command and Constitutional Status

President Sékou Touré is Head of State. The Prime Minister, L. Beavogui, also holds the portfolio of the army. The policy-making body is the National Council for the Revolution.

Role, Commitment, Deployment and Recent Operations

A Guinea battalion (described as commanded by a lieutenant and including six political commissars) was sent to the UN Congo Force in 1960. It was equipped with mortars and heavy machine-guns, and its discipline appeared poor: its general unsuitability prevented it being put to any real test and it was soon withdrawn.

Since then Guinean instructors and personnel have assisted the anti-Portuguese P.A.I.G.C. insurgents in Guinea-Bissau, and have occasionally appeared in a harassing role on the borders of Senegal, Ivory Coast and Liberia, all at one time or another being the subject of accusations of sponsoring counter-revolutionary conspiracies. In 1971 Guinean troops were sent to Sierra Leone at the request of President S. Stevens while his own army was reorganised. These all returned to Guinea within 2 years.

The Guinea army signally failed to contain the Portuguese-sponsored raiding incursion into Conakry from the sea in 1970, the aim of which was to destroy P.A.I.G.C. headquarters.

The army has also been given commitments in the field of development, road-making, farm projects and minor construction work.

Organisation

The army is composed of four infantry battalions, a tank battalion and an engineer unit. It appears that the militia was reduced in size and reorganised into infantry battalions in 1971-2. Some form of militia reserve may still exist, though this may be indistinguishable from local branches of P.D.G. party activists.

Recruitment, Training and Reserve

A system of national civic service, of which military service may be an option, is in force.

Training assistance has been obtained from West Germany and the USSR. The German assistance was reduced in the late 1960s and withdrawn entirely in 1970. A recent report suggests the arrival of a large Cuban training mission in late 1977; this report is unconfirmed.

Equipment and Arms Industry

Guinea's equipment is Soviet-patterned, but obtained from China and Czechoslovakia as well as the USSR. The tank

* For general notes on African armies, see Appendix 1.

World Armies

battalion is equipped with T-34s and there are in addition BTR 152 APCs, probably sufficient only to convey one infantry battalion. The artillery possesses 122 mm, 105 mm and 85 mm field guns, with 57 mm anti-tank weapons, and 100 mm, 57 mm and 23 mm anti-aircraft guns.

The air force operates a small number of MiG-17 and three MiG-21 strike aircraft, together with similarly small numbers of Soviet light transport and training machines and a few helicopters.

Rank, Dress and Distinctions

The rank structure appears to remain French in its nomenclature and connotations; however, actual appointments do not seem always to be related to rank.

Uniforms are of Soviet style, including ankle boots and side caps.

Current Developments

Reliable information is extremely hard to obtain, and other reports often conflict. It is probably correct to assert, however, that for a variety of economic and logistic reasons little could be undertaken without considerable Soviet support. This is likely to be forthcoming as the USSR maintains an exceedingly valuable maritime reconnaissance installation in Guinea.

L. L. MATHEWS

GUINEA – BISSAU

This former Portuguese colony declared itself independent in 1973; the Portuguese government conceded independence in 1974.

Its estimated population is 600,000; the President of the Council of State is Sr L. Cabral.

No details are available yet on the nation's plans for its future defence; the final arrangements will ultimately depend on whether or not the territory combines with the Cape Verde Islands. The same party, P.A.I.G.C., rules both territories but they are at present separate and there is a strong anti-island faction in Bissau.

In the prolonged struggle against the Portuguese from 1963 to 1974, the P.A.I.G.C. (the one permitted party) created the People's Revolutionary Armed Forces (F.A.R.P.) on Maoist lines with an *élite* hard core plus locally based irregular guerrillas and with a militia as an auxiliary. The P.A.I.G.C. and F.A.R.P. both tended to be supported by the Balanta and Nalu ethnic groups, while the Fula supported the Portuguese.

In the actual fighting, the F.A.R.P. divided the territory into sectors within which one 'bi-group' operated. A bi-group was some 30 men in strength with a commander and a political commissar, and was equipped from a variety of weapons including Soviet AK 47s and RPDs (and their Chinese equivalents), Goryunov M49 machine-guns, PPsh 41 and 43 carbines, Degtyrew 1938/46 12.7 mm machine-guns, the Chinese 75 mm type 52 recoilless gun, and Soviet RPG 2 and sometimes RPG 7 weapons; a few units also held Soviet mortars and latterly SAM-7 surface-to-air man-pack missiles. A few special units sited in Guinea or Senegal were equipped with Soviet 122 mm field guns, but these appear to have been only loaned (from Nigeria) and must now be presumed to have been returned.

A small Cuban training mission has been reported but has yet to be confirmed.

It is reported that a small contingent from Guinea-Bissau served with the M.P.L.A. and Cuban forces in Angola in 1975-6. Reports have also suggested that Guinea-Bissau finds more in common, despite the wide ideological difference and much help received in the past from Conakry, with Senegal than with Guinea (Conakry). The reasons for this appear to be Bissau's wish to extend a gesture of reconciliation to the Fula, while these are accused by Sékou Touré of conspiracy against him, and suspicion that Conakry plans to seize the two Piolau islands, the southernmost part of Guinea-Bissau, which have rich fishing grounds. A mutual defence treaty with Senegal has been signed.

L. L. MATHEWS

GUYANA

Although one of the mainland South American republics, Guyana is unique among them in being English-speaking, and having remained a dependent State of Great Britain, until 1966. Its army, the Guyana Defence Force, is therefore very new and remains small. It consists of two infantry battalions: the 1st Guyana Defence Force, a regular unit of three rifle companies, support company and headquarters (700 strong); and the 2nd Guyana Defence Force, a similar unit in which an engineer company replaces the support company. It formerly had three part-time companies and two regular. The Force has four Shortland armoured cars and 12 81 mm mortars. The Air Wing operates six helicopters and nine light aircraft. The Marine Wing has three patrol boats and some other very small craft.

Venezuela lays claim to about two-thirds of Guyanan territory but the dispute was laid in abeyance for 12 years by the 1970 Protocol of Trinidad. There is also a border dispute with Surinam, which led to an armed clash on the border in 1969, but it has been quelled by an agreement to demilitarise the area. There was a minor internal disturbance in 1969, the so-called Rupununi rebellion, fomented by white ranchers among the Amerindians in the interior, but it was put down without difficulty. Guyana's real troubles are more deep-seated. The population divides almost exactly into Negro and Indian (Hindu) halves, who follow different leadership and are unable to co-operate either politically or socially. The negro People's National Congress, led by Forbes Burnham, has been in power since 1968. He is Defence Minister as well as Prime Minister and the Defence Force is under his personal control. Although it contains a number of Indians, recruited when the force was under British control, it is increasingly negro in composition. In the event of serious racial disturbances, its impartiality would therefore be in doubt. Hitherto, however, it has not been called upon to play a major internal security role.

JOHN KEEGAN

HAITI

HISTORY AND INTRODUCTION

There have been two basic kinds of army alternating or coexisting in Haitian history since the heroic period of the wars of independence in the late eighteenth and early nineteenth centuries: relatively small regular forces with a modicum of training and discipline, and larger, ill-disciplined groups of armed men whose sole military capabilities were against either the domestic population or the government. Both kinds have generally acted ruthlessly in pursuit of their own interests, but the level of bloodshed and random terror attendant on this process has been lower when disciplined forces predominated in the military establishment. At the moment Haiti's armed forces are in slow transition from the gangs of hoodlums that were dominant in the 1960s back towards a somewhat more professional armed force.

Haiti, the western third of the Caribbean island of Hispaniola, has had three complete changes of dominant population in the past 500 years: from the Indians to the Spaniards shortly after Columbus's voyage of discovery in 1492; from the Spaniards to the French in 1697, and from French to Africans in 1791–1804. It was during the last period and the few succeeding decades that the basic conditions of modern Haiti's existence were established.

When the French Revolution broke out in 1789 Haiti was France's richest colony, with a population of 35,000 whites, 35,000 mulattos and about half a million black slaves. The majority of the slaves spoke only African languages and a form of pidgin French (which have subsequently blended to create the 'creole' which is spoken by 90% of the population) and practised traditional religions in a form called *vodun* (voodoo). The mulattos, however, were French in language and culture and Catholic in religion. They were active in commerce, and owned one-third of the black slaves.

The great slave revolt which broke out in 1791 and ended by exterminating all the whites in Haiti was led by self-taught black generals — Toussaint L'Ouverture, Jean-Jacques Dessalines and Henri Christophe — who have become Haiti's national military heroes. The French revolutionary government decreed emancipation, and in alliance with French troops the black Haitian forces overran the Spanish part of the island (now the Dominican Republic) in 1798. In 1800, however, there occurred the first of many black–mulatto clashes, the War of the Castes, won by Toussaint's black forces.

He was shortly afterwards treacherously seized and deported to France, where he died in jail, but the French campaign to reconquer the country and reimpose slavery ordered by Napoleon was defeated by Dessalines with British help. In the course of the fighting the remaining whites were wiped out, and Dessalines emerged in 1804 as the Emperor of an independent black-ruled Haiti. He was assassinated in 1806 and mulattoes regained control of the south and west of the country under President Alexandre Pétion, but the black General Henri Christophe ruled in the north as King Henry until his suicide in 1820. Thereupon the mulatto leader Jean-Pierre Boyer reunited the country, and in 1822 conquered the new Dominican Republic which was just emerging from Spanish rule in the rest of the island.

The main themes of Haitian politics were firmly established by then: permanent competition for power between the French-aculturated mulatto minority and black demagogues appealing to the rural peasant masses, who were already lapsing into a primitive subsistence agriculture; and intense national and racial hostility between the Haitians and their Dominican neighbours, who refer to the Haitian occupation as the 'Period of Ethiopianisation'.

By 1843 the third major characteristic of Haitian politics had appeared; the army, an unpopular career amongst the commercially oriented mulattos, had become predominantly black, and overthrew mulatto rule. Control of the Dominican Republic was lost in the following year (though the Emperor Faustin made repeated attempts to reconquer it in the 1850s). Haiti for the next 70 years was ruled by a succession of brutal, often illiterate, negro generals who succeeded for a time (often after much fighting) in gaining control of the army and thus the Presidential Palace.

For most of this period the army averaged about 6000 men, a strength which seems to have been determined largely by the impossibility of looting enough money from the extremely limited public funds to keep the loyalty of a larger number. For practical purposes the sole activity of government was the distribution of legally collected and illegally extorted money amongst its supporters, while the countryside was effectively ungoverned. The army was a totally unprofessional body consisting of the shifting retinues of military adventurers whose goal was political power, with the consequence that it spent a great deal of time fighting itself.

Towards the end of this period the political/military situation became so chaotic — there were six presidents in 1911–15, none of whom lasted a year and all of whom died violently — that the USA intervened. It had already established a customs receivership in 1905, and it was then at the height of its Caribbean interventionist phase, sending in the marines to take control, create reliable 'constabulary-style' forces, and establish orderly government. The USA's occupation of Haiti lasted from 1915 to 1934 and encountered no resistance from the army as such, although there was almost continuous guerrilla warfare in some rural areas against the American marines.

The main changes effected by the USA were the restoration of mulatto rule — the USA governed through a series of mulatto puppet presidents — and the creation of the first modern Haitian army. The old force was entirely disbanded, and

World Armies

marine instructors set about creating a small professional military force (3000 in 1934) which would be efficient, obedient and outside of politics. Inevitably, however, it was a predominantly negro force, so the basic Haitian equation was not changed.

The restored mulatto supremacy under President Sténio Vincent survived the withdrawal of the United States marines in 1934 due to its effective alliance with this new army and the threat of renewed United States intervention (the USA's control over Haitian customs was not relinquished until 1941). The momentum of the USA's reforms was sufficient to ensure the election of another educated mulatto, Elie Lescot, to the Presidency in 1941, but in 1946 the black army, supported by the racially resentful mass of the population, ended this second period of mulatto domination. With the 500-man Palace Guard in the lead, the army took advantage of a general strike to oust Lescot and bring about the election of an anti-mulatto black President, Dumarsais Estimé.

When the latter attempted to ensure his continuation in office by a constitutional amendment in 1950, the army intervened again and brought Colonel Paul Magloire, the leader of the 1946 *junta*, to the Presidency himself. The army's traditional role as the supreme political force in Haiti was restored, although this comparatively well-trained and efficient force exercised its control as a unified and irresistible force issuing decrees, rather than through the bloody factional military uprisings which were typical of Haiti's old army. The army did not neglect its own interests, of course (20% of the national budget was reserved to it, and it had grown to 5000 men by 1956), but it was a far better educated force — all the officers were literate, and many were graduates of the military academy which had been founded in 1941. It had progressed some distance beyond its previous, purely predatory role in Haitian politics, and under Estimé and even under the markedly more conservative Magloire some social and economic advances were made.

This phase was ended, however, when Magloire sought to extend his term of office illegally in 1956. The army overthrew him, but had no agreed candidate to replace him. After some months of chaos, when various candidates from among the 'men of 1946' competed for army support, a black American-educated doctor called François Duvalier succeeded in gaining the support of a majority of the key army officers and so got himself elected President. This was a fatal mistake for the professional army, for Duvalier promptly proceeded to destroy it as a potential rival for power.

Adroitly playing off one military faction against another, Duvalier successively removed most high-ranking officers from the active list, while constantly reshuffling unit commanders to guard against a coup. Not only former supporters of his rivals were removed, but also his own supporters of 1957. The Army Chief of Staff was deprived of the prerogative of selecting the commanders of key posts and also of operational control over the two *élite* units stationed in the capital (the Presidential Guard and the Dessalines Battalion), both of which were assumed by the President himself. As an additional precaution, the bulk of the army's ordnance was moved to storage areas in the basement of the presidential palace and its surrounding grounds. By 1960 or 1961, the army's officer corps had been thoroughly purged, the empty places being filled by Duvalier henchmen, while its combat capabilities had been completely destroyed.

Duvalier chose instead to rely on irregular security forces for internal repression, as a counterbalance to the untrustworthy regular army, and to a considerable degree even as the first line of external defence. It was a deliberate reversion to the type of armed forces that had been predominant in the pre-American intervention era.

The principal force created for this purpose was the National Security Volunteers, whose members (averaging 14,000 during the 1960s) received the equivalent of army basic training, but were paid no salaries. They served in normal times as Duvalier's local paramilitary organisation in the outlying districts, drawing money as needed from local community budgets, but could be mobilised when required either to repel attempted guerrilla landings or to overawe the army.

For enforcement in the capital and for the more active repression of dissent Duvalier relied on the *Tontons Macoutes* (named after the scrounging 'Uncle Strawbag' of Haitian folk legend who kidnaps small children and puts them in sacks). Members of this force of between 1500 and 5000 men, wearing civilian clothes but carrying side-arms, were omnipresent in all government organisations and also in the more important private enterprises, operating as Duvalier's personal intelligence network, control agency, extortion ring and private executioners. Recruited largely from the criminal underworld, they were immune from interference by other government agencies (including the army), and were responsible for most of the atrocities which were Duvalier's main instrument of rule.

With the National Security Volunteers as his army, the *Tontons Macoutes* as his secret police, and the emasculated regular armed forces pushed far into the background, 'Papa Doc' Duvalier was able to rule undisturbed until his death in 1971 (he had made himself President-for-Life in 1964). Five times during his reign there were landings by armed Haitian exiles, including former army officers, seeking to start a popular rising against him, but in each case they were quickly killed or captured by his security forces. The lack of response in the countryside to these various invasions was partly due to the efficiency of his security forces and the traditional political apathy of the illiterate, undernourished peasantry. There is no doubt, however, that Dr Duvalier also exerted a powerful hold on their loyalties through his anti-*élite*, anti-mulatto demagoguery and his astute exploitation of the voodoo priests to spread the belief that he was a great magician.

The stability of his regime was demonstrated by the contemptuous ease with which he withstood intense United States pressure to stand down at the end of his elected term. He cancelled the USA's aid programmes himself, and waited calmly for American fear of the spread of Cuban influence (only 50 miles separate the two islands) to bring Washington back to supporting him — as it duly did in 1964. The best proof of the regime's strength, however, was the fact that the position of President-for-Life was inherited smoothly by his nineteen-year-old son Jean-Claude Duvalier on his death from natural causes in 1971.

The rule of 'Baby Doc' Duvalier has seen modest and sporadic gestures towards liberalisation punctuated by sharp reversals. The fundamental conflict is between the 'old guard' of the regime, led by 'Papa Doc's' widow Maman Simone ('The Guardian of the Sacred Torch of the Revolution') and Henri Sicalit (Head of the State Agency which provides most of the Duvalier family's illicit income, estimated at \$17,000,000 a year), and the younger and better-educated 'technocrats' whom the new President-for-Life has gathered around him. Immediately after the old dictator's death in 1971 a number of the worst *Tonton Macoute* warlords were dismissed. A new Secretary of State for Interior and National Defence, Paul Blanchet, together with two other young ministers, pursued a nationalist line (largely unsuccessfully) against foreign enterprises which had been attracted by Haiti's cheap labour, and even attempted to enforce the labour laws on minimum pay and working conditions.

It was largely as a part of this competition between the young and the old guard that the new government began to improve the status of the army, while downgrading that of the irregular forces in which the old power-holders were entrenched. Since 1971 the National Security Volunteers have been halved in number, and placed under the operational control of the army. The *Tontons Macoutes* still exist but are considerably less visible, and their worst excesses have been curbed. The army has been given better training, and new *élite* counter-insurgency units (the 'Leopards') have been trained to do what was once primarily a militia job.

The Haitian army's effective political power is still negligible, but its status has been raised considerably relative to the regime's paramilitary forces. It remains an obedient tool in the hands of the President-for-Life, but it is an extremely effective tool for internal control: it contains within itself not only the country's police forces, but also its main telecommunications network. Most of it still has little or no capability for conventional combat, but certain units have been restored to an operational status, and morale and discipline have certainly improved.

Military service remains a respected career, and both officers and men are strongly conscious of Haiti's considerable heritage of military achievement in the early nineteenth century. It is possible to envisage circumstances in which the army would regain its former prominence, and no longer play a subordinate role in Haitian affairs.

STRENGTH AND BUDGET

The strength of the Haitian armed forces is 6550 men, of which the army accounts for over 6000. There is a small aviation corps of about 250 men and a coastguard of about 200 men. Numbers on strength have not changed significantly since the late 1950s, and indeed are quite close to those prevailing a century ago. They amount to only 0.1% of Haiti's population of over 5,000,000.

The principal paramilitary force is the National Security Volunteers, a militia organisation which has been drastically reduced in numbers since the death of the elder Duvalier in 1971. It now numbers an estimated 5000–7000 men, the majority of whom are pursuing their private occupations most of the time. There are also the *Tontons Macoutes*, the not very secret police of the regime, who do not have any formal military organisation. Their numbers have apparently been reduced since 1971, but were not known reliably either then or now: estimates range from 1500 to 8000.

The 1976 defence budget was \$10,800,000, amounting to exactly 25% of total government expenditure of \$43,200,000. This was almost exactly the same share of the total budget it received in 1965, and was just under 1% of the GNP of \$1,100,000,000. As much again, however, was probably spent legally on the paramilitary forces.

COMMAND AND CONSTITUTIONAL STATUS

The President-for-Life, Jean-Claude Duvalier, is the Commander-in-Chief of the Haitian Armed Forces, and appoints all officers. He also has personal control over the two *élite* units in the capital: the Presidential Guard of some 700 men, housed on the ground floor and basement of the Presidential Palace, and the Dessalines Battalion, quartered in the Caserne Dessalines on the grounds behind the palace. Most of the army's main items of ordnance are also kept beneath the palace or in the grounds; there are still machine-gun bunkers along the low walls of the palace, but the anti-aircraft guns have now been removed from the lawn.

The Secretary of State for Interior and National Defence is formally in the chain of command; the present incumbent (since May, 1977) is Aurélien Jeanty. The senior military officer is the Chief of the General Staff, who also serves as Commander of the Armed Forces; he is usually a major-general. In what was believed to be a pre-emptive move to forestall a coup or at least a mutiny in the armed forces, the President abruptly dismissed the Chief of Staff and his deputy in 1978; the new Chief of Staff is Lieutenant-General Roger Saint-Albin; the new deputy is Brigadier-General Pierre Hyppolite. The armed forces have a unified system, with the small air force and coastguard under the same commander; police forces are part of the army. Since 1971 the National Security Volunteers have also been under the control of the General Staff, but the secret police (*Tontons Macoutes*) are not.

World Armies

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

The principal role of the Haitian army for the past century has been internal security, an orientation which is clearly reflected in its organisation and deployment. Only three units, numbering no more than 2000 men at most, are capable of conventional military operations; of those, two (the Presidential Guard and the Dessalines Battalion) are employed in guarding the President-for-Life, while the third (the 'Leopards') is primarily a counter-insurgency unit. The remainder of the army consists of the Port-au-Prince Police Force and constabulary forces distributed amongst the six military departments in rural areas.

Haiti belongs to the UN and the Organization of American States, but has no external defence commitments. The principal external defence concern throughout Haiti's history has been the Dominican Republic with which it shares the island. Since 1960 there has also been a potential threat from Cuba, but Haiti relies on the presence of United States naval forces (based at Guantánamo Bay in Cuba and elsewhere in the region) to prevent anything larger than small boatloads of armed Haitian exiles from reaching its shores from Cuba.

The Dominican-Haitian antipathy goes back almost to the creation of the two States — Haiti conquered its neighbour in 1822 and ruled it brutally for the next 22 years — and has been strengthened by subsequent events. There is a constant source of friction in the large number of impoverished Haitians who enter the Dominican Republic illegally to seek work as cane-cutters (at five times the wages they could command at home). The last major crisis was in 1937 when the Dominican army, under the dictator Rafael Leónidas Trujillo Molina, massacred at least 12,000 Haitian seasonal agricultural workers.

The border between the two countries has been closed for a large part of their history, but in the twentieth century the relationship has been dominated not so much by the fear of invasion as by the fact that each has habitually attempted to influence internal political struggles in the other by encouraging plots and/or providing a base for political exiles from its neighbour. Thus in 1949-51 each country accused the other of aggression through sponsoring plots against the existing government in the neighbouring State (an OAS investigating committee found both charges accurate). Trujillo, who had attempted to overthrow any Haitian government which was not dependent upon him since 1930, tried again in the first year of Duvalier's rule, but external pressures against both dictators soon forced them to sign a secret mutual assistance pact in 1958.

After Trujillo's assassination and the election of the leftist candidate Juan Bosch to the Dominican Presidency in 1962 relations again became extremely bad, with constant charges and counter-charges of political intervention. After the American-assisted right-wing victory in the 1965 Dominican civil war and the election of President Joaquín Balaguer in Santo Domingo the following year the crisis atmosphere evaporated, though tensions have continued.

An actual invasion of one country by the other is not very likely in the late twentieth century, however. Certainly the grossly inferior strength of the Haitian armed forces (which are outnumbered 3:1 by the Dominicans) and the pattern of military deployment in both countries suggest that it is not a prospect taken very seriously in either capital. Political intrigues against the neighbouring government have also stopped since Balaguer's election in 1966, and in 1972 the two countries signed an agreement for the expansion of trade and the improvement of communications between them.

The only recent operations of the Haitian army have been against handfuls of armed exiles seeking to create a guerrilla movement against the regime, and they have been uniformly successful in liquidating all such incursions rapidly. There are well over a quarter of a million Haitians in exile, but they do not represent a mortal danger to the regime in themselves: most are settled abroad and are not deeply involved in Haitian affairs any more, while the relatively few active opponents of the government operating from exile are decisively hampered in trying to found an anti-Duvalier guerrilla movement by the gulf that separates them — mostly middle class by Haitian standards, and with a large mulatto contingent — from the world of the Haitian peasant.

ORGANISATION

Arms of Service

The army is made up of 35 companies of infantry (21 of which operate in dispersed units as District Police in areas outside the capital); six companies of the Port-au-Prince Police Force; the Fire Brigade in the capital; and the Prison Guard Company running the National Penitentiary and Fort Dimanche (for political prisoners) in the capital and five other prisons. There are small units which are trained to handle the few old artillery pieces and light tanks, and there are specialised transportation, medical, engineering and communications units. The communications section is of special importance, since it maintains radio-telephone and telephone links with the headquarters of the six military departments, which in turn have at least telephone links with the military districts, subdistricts and rural sections. In many rural areas the army has the only telephone, and is thus the only direct link with all branches of the government in the local and national capitals.

The aviation corps is a single composite squadron which mans both military aircraft and the civilian airline. Both it and the coastguard come under the control of the armed forces general staff in Dessalines Barracks in the capital, which contains four sections: personnel, intelligence, operations and logistics.

Operational

The army is organised into nine Military Departments. Three are in the capital: the Presidential Guard (four companies totalling about 750 men, quartered in the Presidential Palace); Dessalines Barracks (which includes the Dessalines Battalion and headquarters troops); and the Port-au-Prince Police Force of some 600 men. The rest of the country is divided into six Military Departments: North-West, North, Artibonite, West, Centre and South — amongst which are distributed 21 companies operating as a police force in the provincial towns and rural areas. Each of these commands is divided into military districts and sub-districts, below which are the rural posts, each headed by an enlisted man. The militia force (the National Security Volunteers) is under the operational control of Defence Headquarters, and is organised on lines roughly parallel to those of the regional Military Departments.

The only army units which possess any mobility or capability for tactical military operations are the Presidential Guard, the Dessalines Battalion and the Leopards (three companies of commando troops who have been trained in counter-insurgency operations by a Miami-based private company).

The main aviation corps base is at Port-au-Prince airfield; there are ten other cities with airfields able to accommodate medium-sized transport aircraft. The coastguard has several bases around the coasts.

RECRUITMENT, TRAINING AND RESERVES

Recruitment is entirely voluntary, and there are always many more applicants than vacancies. Military service is a lifetime career offering considerable prestige, with material rewards well above those prevailing in most comparable civilian occupations. For commissioned officers there is also the prospect of rapid social and political advancement, although for the past 20 years the very top positions have been closed to them. Conditions of service are good compared to civilian life, including medical care and pensions equal to half the monthly pay on retirement after 25 years of service. Mandatory retirement age is sixty for officers and fifty for enlisted men.

Officer training is provided at the military academy at Frères, founded in 1941, which offers a 3 year course for about 60 cadets. There is also a training school for non-commissioned officers, the *Camp d'Application*.

There are no army reserves, but the National Security Volunteers, still approximately equal in numbers to the regular army, have all received basic military training.

EQUIPMENT AND ARMS INDUSTRY

The army is equipped with standard American light infantry weapons of somewhat dated models. The artillery consists of a few 75 mm and 105 mm howitzers, and some 37 mm and 57 mm anti-tank guns. Light armoured vehicles include some M-113 APCs, six V150 commando vehicles and nine old light tanks.

The air force has about 30 operational aircraft of almost a dozen kinds, for both military operations and civilian air transport. The only combat aircraft are four F-51D Mustang FGAs and six Cessna 337/0-2A COIN aircraft. There are three C-47 and two C-45 transports; four H-34 and six S-58 helicopters and three T-6 and two T-28 training aircraft.

The navy/coastguard has 11 patrol vessels (of which only five are operational), one LCT and a yacht.

There is no arms industry in Haiti.

RANK, DRESS AND DISTINCTIONS

Haitian titles of military rank correspond to those of the United States army. Army and air force officer insignia are worn on shoulder boards, and consist of one, two or three chevrons for company-grade officers, one, two or three small gold stars for field-grade officers, and one, two or three larger silver stars for general officers. Coastguard insignia on dress uniforms are the usual naval gold bands worn on the sleeve.

All three services have khaki fatigue and garrison uniforms of conventional design except the Port-au-Prince Police, who wear similar uniforms in light blue. *Élite* army units have dress and parade uniforms of dark blue, and officers of all three services have full dress white uniforms. Army officers also sometimes wear green blouses with beige slacks, or with riding breeches and boots.

The *Tontons Macoutes* wear blue jeans or black suits with sunglasses. They do not wear badges of rank.

The principal decorations for valour in combat or in police action, reserved for military personnel, are the Military Medal and the Distinguished Service Medal. There are also long-service medals awarded at various intervals to both officers and men.

World Armies

CURRENT DEVELOPMENTS

President-for-Life Jean-Claude Duvalier was only born in 1951, so no early change in the regime by constitutional means is at all likely. He has now survived half as long as his father in the Presidency, so he has clearly established his own network of supporters and no longer depends solely on the elder Duvalier's adherents. Indeed, in the first years of his rule he made considerable efforts to dislodge some of the latter group from key positions, with some success.

The limits of his power were demonstrated in April, 1976 however, when he was forced to accept a reshuffle of government posts engineered by the old guard. His own choice in the key post of Secretary of State for the Interior and National Defence, Paul Blanchet, was replaced by Pierre Bamby, former private secretary to 'Papa Doc' and a particularly bloodstained functionary who had personally organised several massacres of opposition elements. Duvalier managed to dismiss Bamby in May, 1977 justifying it as a pre-emption of expected American criticism on human rights, and replaced him with one of his own closest aides, former Justice Minister Aurélien Jeanty, but it is evident that there is a somewhat precarious balance of forces between the younger and older generations amongst the ruling family and their associates.

Whichever faction eventually triumphs, it is virtually certain that power will remain within the circle of the present ruling civilian and military *élite*. The Haitian opposition in exile is split into a great many ineffectual and squabbling groups, and there is no organised underground resistance at home (virtually the entire leadership of the Haitian Communist Party was machine-gunned to death by the *Tontons Macoutes* while meeting in a house in Port-au-Prince in 1969). There are very occasionally hit-and-run raids by exile groups — in 1976 a 'commando group' of exile youths landed from North America and killed a dozen *Tontons Macoutes* before escaping across the Dominican border — but they do not represent a serious threat to the regime. In the parliamentary elections of February, 1979 which the President had meant to use to displace some of the more powerful adherents of his mother and the 'Old Guard', the latter emerged triumphant. Mrs Duvalier has also secured the removal of her son's chief adviser, Mines and Energy Minister Henri Bayard. Unusual signs of instability were evident after the election, when there were 10 days of riots in provincial cities and several hundred arrests.

Precisely what role the army might play in the intra-regime competition in the future cannot be predicted, but the focus of the recent power struggle on control of the National Defence Department confirms the impression that the army is now a far larger factor in Haitian politics than it was five or ten years ago. There is no direct evidence that it has yet begun to behave again as an independent actor, but it seems likely that the same generational split exists in the officer corps as in the civilian apparatus of the regime. With its paramilitary rivals substantially reduced in size and influence, it would not be surprising if the army eventually resumed its leading role in Haitian affairs.

None of this is likely to alter the increasingly grim basic fact about Haiti: its terrible and growing poverty. It has long been the poorest and least developed country of the Western Hemisphere: 75–80% of the population are illiterate, and 90% live by primitive subsistence agriculture and receive a cash income averaging less than \$1.00 a week. Most Haitians lead an existence which is close to that in West Africa before colonisation.

All this has been true ever since Haitian independence 175 years ago: what has changed is the population. Haiti is an extremely small country — about 10,000 square miles, of which less than a third is arable land. The population is already over 5,000,000 and growing fast, with the result that the effective population density in the settled rural areas is already over 1500 per square mile. Even advanced agricultural techniques will not easily support such a population. The primitive agricultural techniques in use are rapidly destroying the fertility of the land, while the hills have long been denuded of trees in order to provide firewood and room for coffee planting, leading to a rapid erosion.

Quite simply, the country is rapidly turning into a desert, while the population pressure on the land continues to mount. Already famine is chronic in parts of the north-west, and malnutrition is the norm in most of Haiti. From 5,000,000 people and 3000 square miles of arable land now, the country may reach the turn of the century with 10,000,000 people and virtually no cultivable land. Such a trend virtually guarantees growing political turmoil and suggests that any future government will be critically dependent on the armed forces for its survival.

GWYNNE DYER

HONDURAS

HISTORY AND INTRODUCTION

The Honduran army, despite an apparently lengthy history, is in fact an exceedingly new military institution. For practical purposes it is much the youngest army in Central America, and its rapid growth and politically adventurous character are causing grave concern amongst the conservative military establishments that rule in all three of Honduras's neighbours.

Since their humiliating defeat in the 1969 war with El Salvador, the Honduran armed forces have tripled in size. They are now equal in size to those of the traditional Central American giant, Guatemala (which has twice the population of Honduras), and twice as big as those of any other Central American State. Moreover, during the past 5 years the Honduran army has displayed an increasing inclination towards that brand of military socialism which is associated with the 'Peruvian' or 'Portuguese' models, a potentially infectious development which is even more disturbing to the rulers of neighbouring Central American States.

It may seem surprising that such anxieties might be entertained about a country which has frequently been described as the 'definitive banana republic', and 'the most retarded of the Central American States' — especially since those epithets were entirely true as recently as 15 years ago. In a curious way, however, such facts help to explain the current pattern of developments in Honduras.

While it is perfectly true that virtually all of Honduras's foreign exchange is derived from bananas, for example, the intensive development of that industry by large foreign companies along the northern coast (where there is also a substantial black West Indian minority of more advanced political ideas) was instrumental in the creation of the first real Honduran labour movement. This example spread to other urban workers in the inland capital of Tegucigalpa, and subsequently to peasant organisations as well, during the 1950s and 1960s, and has fundamentally changed the balance of Honduran politics. Even that influence does not begin to compare with the emergence of a cohesive and potentially radical professional military establishment, however. Its radicalism is largely a function of its newness, which in turn derives from the extreme backwardness and lack of central institutions in Honduran social structure until very recently.

At first glance Honduran history from the end of Spanish rule in 1821 seems simply an exaggerated version of the typical Central American pattern: there were 134 coups in the next 134 years, with a rather higher frequency in the nineteenth than the twentieth century. Foreign armies were more often involved in these violent changes of government than was common elsewhere in the isthmus, but this was presumably only a reflection of Honduras's extreme weakness and disorganisation. All of the governments that ruled Honduras were corrupt and conservative, and most of the presidents bore the title of 'general'. But the image this creates of a Honduran military institution with an inveterate disposition to seize power and govern in its own interests is wholly illusory: in fact the first truly *military* coup in the conventional sense only occurred in Honduras in 1957, for the simple reason that there was not any recognisable military institution in the country until about 1950.

There were, to be sure, any number of organisations calling themselves 'armies', but they were purely transitory phenomena. There never developed in Honduras the sort of stable military institution with strong corporate identity and interests that evolved in Guatemala and El Salvador in the nineteenth century. Honduran 'armies' were purely instrumental in politics, as the armed expression of the power of some 'political party' (which in reality was itself simply the personal following of some powerful individual).

This was the natural consequence of the character of Honduran society. Honduras was, and to a large extent still is, a land of small isolated peasant communities. It is a racially homogeneous society (over 90% are mestizo, and the white minority which traditionally dominated politics in its neighbours is an exiguous 1% in Honduras). It also lacks the usual sharply defined class structure (although approximately 600 families owned almost a third of the land, there was not the tight oligarchy of rich land-owners which monopolised national politics elsewhere).

In such a decentralised society, political power was acquired by creating a local guerrilla band, making alliances with similar aspiring politicians, and overthrowing the government. The 'army' that had defended the last bunch of rascals was dispersed, and one's own guerrilla commanders became the officers of the new national 'army'. The newly confirmed generals then returned to civilian life, usually as provincial governors, while the decentralised military structure would be staffed by lower-level leaders of the guerrilla band.

For practical purposes there would be no enlisted men in the 'army' in peacetime, merely militia lists of men in each district who would be theoretically available when it became necessary to fight off the attacks of the next upward-mobile guerrilla band. If the challengers won, then once again the national 'army' would be disbanded and their own forces substituted. Power changed hands by fighting, as a rule, but politics was civilian; while there was always a Honduran 'army' (if not two or three), the personnel would change completely from time to time, and there was no professional military institution.

World Armies

This pattern persisted well into the twentieth century. One unusually far-sighted President, Miguel Dávila, tried to secure his position by founding a Military Academy and an Artillery School between 1903 and 1906 (importing a Chilean colonel and a French sergeant to direct them), but all their graduates were dismissed from the army after the next revolution in 1911, and both schools were frequently closed until the 1920s. The real beginnings of the Honduran military profession had to wait until a period of political stability was achieved under the iron rule of President Tiburcio Carías Andino in 1933–49.

Carías himself achieved power by the traditional route. He was apprenticed to his family's band of guerrillas at the age of sixteen, commanded a detachment fighting for the Nicaraguan *caudillo* José Santos Zelaya in 1907, and eventually had himself made a general of the Honduran army after he had become the most powerful political figure in the country. His decision to create a corps of trained professional officers was manifestly directed towards improving the counter-insurgency abilities of the Honduran armed forces.

As early as 1924 he had been impressed by the counter-insurgency potential of aerial bombardment (a small Honduran Air Corps had been created in 1922), and his first step was to found a Military Aviation School in 1934 with United States aid. By 1942 Honduras had 22 aircraft manned by United States-trained pilots, which proved very useful in maintaining his rule. (This was the origin of the markedly higher status which the Honduran air force still enjoys in the armed forces, by comparison with other Central American States.)

The process of creeping professionalisation, with United States aid, continued with the creation of a Basic Arms School to train both officers and men in 1946, and the founding of the Francisco Morazán Military Academy to train officer cadets in 1952. Large numbers of officers also attended year-long courses at the United States Army School of the Americas in the Canal Zone. Parallel to these military educational developments was a United States Military Assistance Programme to create more mobile formations equipped for conventional combat and counter-insurgency operations in the army, which had hitherto been a wholly regional and militia-based organisation: the First Infantry Battalion was formed in 1947 along United States Army lines, and four further infantry, engineer and artillery battalions followed.

Educational standards were progressively raised at the Military Academy — in 1956 a programme of civilian education leading to a full secondary school-level qualification in arts and sciences was introduced alongside the military subjects — and a military officer's career for the first time became an attractive alternative for ambitious young Hondurans. In the same period entrance standards were steadily raised, which had the effect — given the shortcomings of the Honduran rural school system — of shifting the officer recruitment base from the traditional rural sources to the urban lower-middle class (by 1961 almost half the cadets came from towns of over 10,000, compared with 14% of the general population). This factor undoubtedly explains much of the greater political radicalism of the generation of officers reaching senior rank in the middle 1970s (discussed later), but already by 1957 the army had become sufficiently professionalised to carry out the first autonomously military coup, independent of civilian politicians, in Honduran history.

It was a hesitant intervention, occurring only after 2 years of political chaos and widespread violence. Carías's hand-picked successor had controlled the presidency from 1949 to 1955, but when the strong-man decided to return to power himself in the election of that year his National Party, rotted by decades of power, split in two, allowing the Liberal Party candidate Ramón Villeda Morales to win a clear majority. He was denied his victory by some adroit political chicanery, however, and in 1956 a National Party leader was installed in the presidency instead. Shortly afterwards a group of young officers overthrew him and held new elections for a constituent assembly, which duly installed Villeda Morales as President in late 1957.

The intervention was not motivated by party considerations, though many of the young officers may have been in sympathy with Villeda's liberal ideas. It was an act of institutional self-defence, intended to preserve the newly professional army from the injuries that the turbulent old political system, now apparently returning, had traditionally inflicted on the army's cohesion and status. This was most evident in the 1957 Constitution, which contained an unusual provision that the President's orders to the military were to be obeyed only if given through the Chief of the Armed Forces. It also granted the army the explicit right to disobey executive commands which were viewed as violating the Constitution, gave the Armed Forces Commander the right to appeal Presidential orders to Congress, and stripped the civilian government of all meaningful control over military promotions and assignments (*see* Command and Constitutional Status).

The Villeda Morales government's pro-labour measures and its generally liberal outlook certainly created some hostility amongst more conservative soldiers, but the reason for its overthrow by the coup of 1963 was once again the defence of the new military institution's autonomy. This was threatened by two specific measures: the creation of a paramilitary Civil Guard of 2500 men directly under the President's command in 1959, in a deliberate attempt to counterbalance the influence of the armed forces, and the campaign promise of the Liberal candidate in the forthcoming 1963 elections to remove the offending clauses on military autonomy from the constitution. When it became clear that this candidate, Modesto Rodas Alvarado, would probably win the election, the armed forces under the leadership of air force Colonel Osvaldo López Arellano overthrew the government and cancelled the elections.

This time the armed forces stayed in power; the new Constitution of 1965 repeated the clauses about military autonomy, and Colonel López became President. The rival Civil Guard was abolished, and replaced by the Special Security Corps (CES), which is staffed almost entirely by ex-army men. Although López observed the constitutional ban against a president succeeding himself, and permitted a civilian candidate of the conservative National Party to be elected in 1971, he retained his position as Chief of the Armed Forces 'in the interest of national unity'. The civilian interlude lasted little more

than a year; in December, 1972 the figurehead president was eased out of power in a bloodless coup and López announced that he would serve out the remainder of his 6 year term. Since then all political parties in Honduras have been banned, and government is by decree; the elections originally scheduled for 1977 have been postponed by the army until 1979.

Up to about 1970 the new military domination of Honduran political life can be seen mainly as the defensive action of a recent and still vulnerable profession. The political style was typical of the wave of military interventions that swept Latin America in the early 1960s in reaction to the Castroite guerrilla threat (though there has never been any communist guerrilla activity in Honduras). López's first government was conservative, oppressive, blindly hostile to organised labour (which he characterised as 'an agent of international communism'), and extremely compliant to foreign investment interests.

Two developments have now transformed the perspectives of the Honduran armed forces, however. One was their defeat in the 1969 'Football War' with El Salvador (see Role, Commitment, Deployment and Recent Operations), which has led to a very rapid expansion of the armed forces and a greater emphasis on conventional warfare capabilities. The other was the rise to senior rank of academy-trained officers of urban lower-middle-class background, which has radically altered the armed forces' political stance. The pressures in this direction were already evident during the first years of López's second term, when he changed to nationalist and reformist policies, and since his removal in 1975 the influence of the powerful *peruanista* faction in the officer corps has been ever more evident. (See Current Developments.) In terms both of military strength and of political innovation, the Honduran army is rapidly becoming the most important armed force in Central America.

STRENGTH AND BUDGET

The strength of the Honduran armed forces in 1977 was 14,200 men, of whom 13,000 were in the army and 1200 in the air force. (The tiny coastguard is manned by fewer than 100 army personnel.) This force represents more than a threefold increase on the 1970 strength of 4200 men: air force numbers have remained about the same, despite a substantial re-equipment programme, and virtually all the expansion has been in combat elements of the ground forces. Military manpower is now 0.4% of the total population of about 3,500,000.

There is a paramilitary force of about 3000 men, and a substantial trained and semi-trained reserve which was actually mobilised during the 1969 war.

The 1977 military budget was \$25,300,000, a threefold increase on the 1968 budget. Military expenditure, while rising in absolute terms, took a steadily declining share of the national budget and the GNP between 1940 and 1970, but it has since increased again, and now takes about 2.5% of GNP.

COMMAND AND CONSTITUTIONAL STATUS

The President of the Republic is Commander-in-Chief of the Armed Forces, with the right to declare war and make peace, to send Honduran troops abroad and allow foreign troops to enter the country, and to name officers up to the rank of captain on the recommendation of the Chief of the Armed Forces. Officers of higher rank are appointed by Congress on the joint recommendation of these two persons. The President's authority is severely limited, however, by special constitutional provisions which give the Chief of the Armed Forces the right to disobey Presidential orders which are believed to violate the constitution, and obliges the President to relay all his orders through the Chief of the Armed Forces. In practice, moreover, the Chief of the Armed Forces has full control over all officers' appointments.

There is a Secretary of Defence with cabinet rank, heading the Department of Defence, but he is outside the chain of command and the Department deals only with administrative matters.

More important is the Superior Council of National Defence, an advisory body comprised of the President, the Secretary of Defence, the Chief of the Armed Forces, the Chief of Staff of the Armed Forces, and all the top military commanders. Its principal constitutional function is to select candidates for Chief of the Armed Forces for a 6 year term if the job falls vacant, and to remove incumbents when necessary. This has the effect of removing such questions from the control of the President, since all but two of its members (originally eight, but now reportedly twenty-two) are military officers.

The Chief of the Armed Forces exercises direct operational control over all subordinate commands, and is in charge of all military assignments including those of unit and zone commanders (except for the Presidential General Staff and Presidential Guard).

These provisions were originally designed to ensure armed forces' independence from civilian presidential control; they now function as a means by which the collective leadership of the armed forces can exercise control over a military president. The expanded Superior Council of National Defence has become the principal arena in which armed forces' policy is debated and decided, and the means of guaranteeing that the officer occupying the presidency does not grow over-mighty.

World Armies

To this end, it is essential that the President should not also occupy the office of Chief of the Armed Forces, and it is noteworthy that the first step in removing López Arellano was to deprive him of the latter position in 1974. It is through this body, rather than through the President, that the *peruanista* faction of the officer corps exerts its influence.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Up to 1969 the primary role of the Honduran armed forces was considered to be internal security, but the war with El Salvador in that year has since led to much greater emphasis on external defence. Long-standing border disputes with other neighbours were formally settled with Guatemala in 1933 and with Nicaragua in 1961, but the ideological hostility of both these countries' governments to the leftward trend in the Honduran officer corps has also caused some anxiety in Tegucigalpa.

The internal security task has been largely delegated to the paramilitary CES, now expanded to about 3000 men, which maintains a large force in the capital and small but relatively competent detachments in all provincial towns and cities. Since the disbanding of the Civil Guard in 1963 the armed forces have had total control of the internal security apparatus — most CES officers and men are drawn directly from the armed forces — but there is a deliberate policy of keeping the armed forces proper out of the often distasteful business of dealing with rural unrest, and so preserving a favourable public image of the army. The armed forces are not likely to be drawn into large-scale security operations in the future unless CES units prove inadequate to deal with the task. On the other hand, the army and the air force both run large and highly visible civic action programmes, concentrating on short-term projects in education, health, agriculture and highway construction.

There are army troops deployed throughout the country in six military zone commands, but the bulk of the combat units are concentrated in the 'special army corps', which are headquartered near the two major cities of Tegucigalpa and San Pedro Sula, with substantial detachments along the El Salvador border. There is also a larger than usual concentration of military forces in Gracias a Dios province, at the Atlantic end of the Nicaraguan border, which includes the territory whose ownership was disputed by Nicaragua prior to 1960.

Honduras belongs to the United Nations, the Organization of American States, the Central American Common Market and the Organization of Central American States. It has only once sent troops abroad — a 250-man contingent was dispatched to the Dominican Republic in 1965 as part of the OAS peace-keeping force — and there are no foreign bases on its territory. Honduras's relations with the OCAS and its military sub-organisation, the Central American Defense Council, have been rather cool in recent years, due to the domination of the latter body by the right-wing governments of its neighbours. The CACM has never fully recovered from the 1969 war between El Salvador and Honduras, which was followed by border closure and trade restrictions between these two centrally placed members for a number of years.

The principal recent operation of the Honduran armed forces was the 1969 war, which was triggered by riots against a Honduran football team visiting San Salvador for the World Cup play-offs, and counter-riots against Salvadorean immigrants in Honduras. The real cause, however, was the presence in Honduras of about 300,000 immigrants, many of them illegal, from the overcrowded countryside of El Salvador (where population density is almost ten times as high). There was great Honduran resentment against these immigrants from what is, after all, a somewhat richer country, who made up fully one-eighth of the resident population in 1969, and the government was not above using them as scapegoats. Additional causes for concern were the specific border disputes between the two countries, and much wider expansionist ideas which circulated freely in El Salvador.

The serious fighting in the war lasted only a week, though there were up to 2000 people killed in the fighting and anti-Salvadorean riots in Honduras, and over 100,000 Salvadorean immigrants became refugees. The war on the ground was characterised by steady Salvadorean advances of up to 20 miles against the small and ill-equipped Honduran army along the Pan-American Highway leading east towards Tegucigalpa, and northwards near the Guatemalan frontier towards the Caribbean coast city of San Pedro Sula. Both sides employed air strikes extensively against military and civilian targets, but the most effective attack was the Honduran raid on El Salvador's main oil refinery at Acajutla. The fighting was ended with the introduction of OAS observers, and Salvadorean forces evacuated all occupied Honduran territory within a month. (For further details, see *El Salvador: Recent Operations*.)

Border clashes continued until 1971, when a 2km demilitarised zone was created along the frontier, and various mediation attempts have since failed to produce a comprehensive agreement. There were renewed border clashes in July, 1976 when Honduras accused El Salvador of launching an invasion, and tensions continue to run high. The principal result of the war in Honduras has been a resolve to expand the combat elements of the armed forces rapidly and to undertake a major military re-equipment programme, in order to avoid in the future any possibility of a military humiliation similar to 1969.

ORGANISATION

Arms of Service

The army consists of 10 infantry battalions, one Presidential Guard battalion, two artillery batteries, one engineer battalion

and one signals battalion. This represents an almost complete change from 10 years ago, when the main strength of the army was distributed throughout the country's six military zones in garrison units — roughly one battalion per zone, one company per canton — that received only limited regular military training, and only the so-called 'special units' (the Presidential Guard, three infantry battalions and the First Engineer Battalion) were equipped or trained for regular combat.

The air force is organised as a single composite squadron, based primarily at Toncontín International Airport near Tegucigalpa. Aircraft are also based at La Mesa, near San Pedro Sula, and there is a network of about 85 usable airstrips throughout the country.

Operational

The Presidential Guard is under the personal command of the President. All other army units, and also the six military zone commanders, are under the direct command of the Chief of the Armed Forces, who is assisted by a general staff operating at armed forces headquarters in the capital. The air force is an autonomous organisation, but is also controlled directly by the Chief of the Armed Forces.

RECRUITMENT, TRAINING AND RESERVES

The constitution makes military service compulsory for all male citizens, but during peacetime the armed forces are composed mainly of volunteers, the benefits available to soldiers being more than sufficient to fill the ranks. Citizens are potentially liable for up to 18 months' compulsory service between the ages of eighteen and thirty-two, but the average length of time conscripts actually spend on active service is 8 months, with subsequent reserve training. For many enlisted men military service is their first contact with the modern world and their only experience of formal education. The armed forces therefore provide literacy programmes, and often some trades or agricultural training to servicemen shortly before they return to civilian life.

Until 1957 Honduran officers were almost all promoted from the ranks, but since then the main source of officers has been direct-entry primary-school graduates to the Francisco Morazán Military School in the capital. There are stiff competitive entry examinations, with the ratio of applicants to places as high as 15:1, and the Academy provides a comprehensive 5 year course of military and academic studies. Graduating cadets receive the rank of sublieutenant (2nd Lt.), and most receive scholarships for an additional year of military study abroad, usually at the United States Army School of the Americas in the Panama Canal Zone. Air force pilots, cadets and technicians receive fairly extensive training at the Military Aviation School at Toncontín. Advanced training is provided by the First Infantry Battalion in Tegucigalpa and by comparable artillery and engineer model formations. Officers' staff and advanced technical training is mostly done abroad, primarily in the Canal Zone and the USA, but to a limited extent in Europe as well. The excuse of the disastrous 1969 war was used by the more professional junior officers to purge many of the older and less competent officers, and to introduce a compulsory retirement age.

The reserve system is theoretically all-embracing, and many civilians with virtually no training were mobilised in 1969. The unsatisfactory results of that experience have led to the creation of a more organised reserve system, but the number of trained men actually available for mobilisation is unknown.

EQUIPMENT AND ARMS INDUSTRY

The army is equipped with standard American infantry weapons and light transport vehicles, although the M-1 rifle has now been replaced by the Belgian FN. There are 57 mm RCLs, 81 mm and 120 mm mortars, and 12 75 mm pack howitzers and eight 105 mm howitzers. The army has a small number of light tanks, and in early 1978 ordered Scorpion light tanks from Britain.

The air force has been almost completely re-equipped since 1969, with a heavy reliance on purchases from Israel. It now possesses 12 ex-Israeli Super Mystère B2 fighter-bombers, in addition to four older F-86Ks, nine World War II vintage F-4U Corsairs and one B-26 bomber. Transport aircraft include three Aravas, one IAI Westwind, one C-54 and two Cessna 180s. Trainers include six AT-37Bs, four T-28Es, nine T-41s, one RT-33A and some T-6Gs. A number of these are armed, and available for ground-attack operations.

RANK, DRESS AND DISTINCTIONS

Rank structure generally follows that of the United States army, with the exception that sublieutenant is substituted for second-lieutenant, and brigade and division generals for the equivalent American ranks of brigadier-general and major-general. There are no higher ranks in the Honduran armed forces. Officers' rank insignia are one, two or three gold bars for company-grade officers, one, two or three gold stars for field grades, and four or five silver stars for general officers, in

World Armies

order of increasing seniority. Air force personnel are distinguished only by corps insignia, and by wings worn on the jacket or shirt pocket where appropriate.

The basic service uniform is olive-green fatigues with cloth or garrison caps; with the substitution of a helmet, a canvas belt and khaki leggings, this becomes the field uniform, worn on exercises, guard duty and parades. The service dress uniform is khaki in summer, and olive green in winter. Officers' dress uniforms are navy-blue trousers with a gold stripe, white shirt, black tie, a white or navy-blue jacket according to the season, epaulettes, and a navy-blue hat with black peak and gold chinstrap.

The highest military award is the Decoration for Merit, which comes in several classes. Other distinctions include the Heroic Valour Decoration, the Distinguished Service Cross and Medal, the Flying Cross, the Soldier's Medal for outstanding enlisted performance, and the Conduct Medal.

CURRENT DEVELOPMENTS

The influence of a group of young army officers who favour radical social reforms was already evident early in President López Arellano's second term, when he reversed his previous policies by introducing limited measures of land reform, providing government support for the formation of trade unions, terminating concessions to foreign mining companies and nationalising the foreign-owned lumber industries. Once the Peruvian-influenced faction had established a dominant position in the Superior Council of the Armed Forces, however, it forced López to relinquish his position as Chief of the Armed Forces in March, 1974 to Colonel Juan Melgar Castro, a compromise candidate acceptable to both radicals and the more moderate reformers.

López's position was further undermined by his apparent inability to cope with the task of national reconstruction following the disastrous Hurricane Fifi in late 1974, and allegations that he had accepted bribes from United Brands, a large American-owned company that dominated the vitally important production and export of bananas. López was removed by the army in March, 1975 and his place as President assumed by Colonel Melgar Castro (who was simultaneously obliged to relinquish his office of Chief of the Armed Forces, however).

The new government nationalised the banana industry and embarked on an ambitious programme of agrarian reform. There are three discernible factions in the Superior Council of National Defence, which actually controls the government: conservatives like Melgar Castro, linked to land-owners and commercial interests; reformist colonels who have the support of the Church and the national peasants' union; and a radical group of young *peruanista* lieutenant-colonels who are backed by the rival left-wing peasants' union and the university students.

The allegations of corruption which finally caused the Superior Council of National Defence to unseat López Arellano in 1975 also accounted for President Melgar Castro in 1978. He was accused of involvement, along with other high-ranking officials, in a \$30,000,000-a-year operation smuggling cocaine from Colombia to the USA, and on August 7th, 1978 was removed from power in a bloodless coup. The three members of the *junta* which replaced him are General Policarpo Juan Paz García, Chief of the Armed Forces and Commanding General of the Army, Lieutenant-Colonel Domingo Alvarez, Chief of the Air Force, and Lieutenant-Colonel Amilcar Zelaya Rodriguez, Chief of the Public Security Forces. They are all known individually as being considerably to the right of Melgar Castro politically, but it is not known whether this indicates a shift in the balance of forces within the Superior Council of National Defence. They have confirmed their adherence to the reform programme promulgated in 1975, and affirm that the planned national elections will be held in April, 1980.

Honduras is the second least developed country in the Western Hemisphere, with appalling poverty, an extremely low literacy rate, widespread malnutrition, and only a minute industrialised sector of the economy — not precisely the place where military radicals would be expected to emerge, or to succeed in their efforts at root-and-branch reform. That such a process has actually begun is mainly due to the very newness of the military profession in Honduras, which lacks the conservative traditions and institutional alliances of the older Latin American armed forces. At the same time, the lack of powerful competing organisations has allowed the army to establish rapidly an unusually high degree of control over national life, and (together with the 1969 war) has allowed it to embark on a programme of military expansion and re-equipment whose only Latin American counterpart — allowing for differences of scale — is in Peru.

Should war break out again with El Salvador — which is not inconceivable — the Honduran army would certainly give a better account of itself than in 1969, although victory would by no means be assured. What causes at least as much concern in Honduras is the possibility that the conservative military regimes which surround it might support an attempt to overthrow the present balance of forces in Tegucigalpa, possibly even with armed force.

GWYNNE DYER

HUNGARY

HISTORY AND INTRODUCTION

Although Hungary emerged as a fully independent State only at the end of World War I, she had a long and colourful national tradition which looked back as far as the coronation of St. Stephen on Christmas Day, 1000. Centuries of Hapsburg dominance were unable to suppress Hungarian nationalism, and the establishment, in 1867, of the Dual Monarchy gave Hungary a large measure of autonomy within the Hapsburg Empire. Certain matters, notably defence and foreign affairs, were the responsibility of common, rather than national, ministries, but even in these fields Hungary made significant contributions to the Empire as a whole. Hungarian influence helped prevent Austrian interference in German affairs, while in the sphere of defence Hungary provided the Imperial and Royal armies with large numbers of troops, among them the light cavalry for which Hungary was rightly famed. It is interesting to note that, just as Polish military dress served as the basis for lancer uniforms in other European armies, so the costume of Hungarian light horsemen became institutionalised as hussar uniform.

Hungary suffered severely as a result of her involvement in World War I. She was dismembered as the Hapsburg Empire collapsed: Slovakia was occupied by the Czechoslovakians, and Transylvania by the Romanians. A Republic was declared in November, 1918 under the presidency of Count Mihály Károlyi, who resigned in March, 1919 when it became clear that the Allies intended to strip Hungary of her national minorities. Power passed into the hands of the Communist Béla Kun who, confident in Russian support, formed a Red Army and tried to recover the lost territories by force. The expected Russian help was not forthcoming, and Béla Kun fled to Austria on August 4th, 1919; the Romanians took Budapest 2 days later.

Romanian occupation of Hungary's capital was short-lived. The Allies were, though, not prepared to conclude an agreement with the conservative regime which succeeded that of Béla Kun, and it was not until November that an acceptable provisional government was formed. The Treaty of Trianon deprived Hungary of most of her non-Magyar elements, which were given to Czechoslovakia, Romania, Yugoslavia and Austria: well over two-thirds of historic Hungary was lost. The new parliament, elected in January, 1920 annulled all measures enacted by the previous post-war regimes: the monarchy was restored, and on March 1st Admiral Miklós Horthy was elected Regent and entrusted with the powers normally exercised by the Crown. The former Emperor Karl made two attempts, in March and October, 1921 to claim the throne, but was thwarted by the Allies as well as by anti-legitimists within Hungary.

The Hungarian economy, aided by a substantial loan from the League of Nations, made an excellent recovery. The decade commencing in 1921 saw the dominance of Count István Bethlen, under whom Hungary became an authoritarian, but not totalitarian, State. Many of the country's serious social and economic problems remained unsolved, and Bethlen's fall, itself a consequence of the financial crisis, was followed by a period of unrest from which intense right-wing anti-semitic radicalism emerged. Gyula Gömbös, who became Prime Minister in October, 1932 pursued a policy of *rapprochement* with Germany, motivated by a desire to recover Hungary's historic frontiers with German assistance as well as by certain ideological sympathies with Nazism. Gömbös died in October, 1936 and his successors brought Hungary more closely within the sphere of German and Italian influence. Count Pál Telecki took over as Prime Minister in early 1939. He was initially fortunate: Hungary re-acquired Ruthenia in March, 1939 and was not compelled by Germany to join her when war broke out. Telecki's luck could not last: in the spring of 1941 German troops passed through Hungary on their way to attack Yugoslavia, and Telecki, fearing that this would drag Hungary into the war, committed suicide.

Hungary sent a small force to assist the Germans in their invasion of Russia, but soon came under pressure to increase this military involvement. Horthy, convinced that the Allies would ultimately win the war, appointed the liberal Miklós Kállay Prime Minister in March, 1942 but 2 years later Hitler forced Horthy to appoint an overtly collaborationist government. Thousands of Hungarian Jews were deported, and Hungarian forces on the Eastern Front, badly mauled at Voronezh in January, 1943, were reinforced with hastily trained drafts. In October, 1944 Horthy concluded an armistice with the Russians, but was seized and deposed by the Germans as soon as he announced the news. Soviet liberation of Hungary was completed in April, 1945. A provisional government, formed at Debrecen in December, 1944, took over the running of the country, having signed an armistice by which all territorial gains since 1938 were renounced. The peace treaty of February, 1947 restored the 1920 frontiers, with a minor variation, in Czechoslovakia's favour, in the north; it also placed certain limits upon the size of the Hungarian armed forces.

Although the provisional government contained only two communists, increasing pressure from the parties of the left led to the formation in June, 1948 of the powerful Communist 'Workers' Party', which gained an overwhelming majority in the May, 1949 elections. Hungary was proclaimed a People's Republic, and real power was concentrated in the hands of the Party's First Secretary, Mátyás Rákosi. In 1949 there was a struggle for power within the Party, the victory of whose Soviet-inspired faction was accompanied by a purge within the army, civil service, judiciary and church. Rákosi remained

World Armies

dominant until July, 1953 when Imre Nagy became Prime Minister in his place. Rákosi, however, remained Party Secretary, and in the spring of 1955 he secured the dismissal of Nagy, whose reforms had been bitterly opposed by Hungarian Stalinists. Rákosi himself survived only a year, and was forced to resign in July, 1956. He was succeeded by his political associate Ernő Gerő, whose policy of repression led to the revolt of October 23rd, 1956. The Hungarian army proved unwilling to resist the demonstrators, and Soviet troops were forced to leave Budapest. Nagy was swept into power at the head of a coalition government: numerous reforms were promised, and hundreds of political prisoners were freed. Hungary's new-found freedom was short-lived. Soviet reinforcements began to enter the country in late October, and on the night of November 3rd/4th the military leaders of the revolt were seized as they negotiated with the Russians. At dawn on November 4th, Soviet forces swept into action, and the revolt was snuffed out within a matter of days.

The Soviet offensive was accompanied by the establishment, behind Russian lines, of a new government headed by János Kádár, and it was this body which assumed power in Budapest following the collapse of the revolt. Kádár was Prime Minister from late 1956 until 1958, and again from 1961 until 1965. He remained Party Secretary throughout, and continues to hold this office today. Despite its origins, the Kádár regime has proved more stable and less austere than those of Rákosi or Gerő, and numerous economic reforms have been instituted, notably in 1968.

STRENGTH AND BUDGET

Population: 10,551,000
Army and River Guard: 83,000, with 130,000 reserves
Air force: 20,000; 176 combat aircraft
Border guards and security troops: 20,000
Workers' militia: 60,000
GNP (1976 estimate): \$23,100,000,000
Defence expenditure (1977): \$590,000,000

COMMAND AND CONSTITUTIONAL STATUS

Command

Officers are appointed, and may be dismissed, by the Presidential Council, but the Minister of War is *de facto* Commander-in-Chief of the Armed Forces. The minister is assisted by a number of deputies: his ministry is divided into several directorates, and controls two main branches (Ground Forces, and Air and Air-Defence Forces) together with the 500-man River Guard. Hungary is divided into four military districts, which have their headquarters at Budapest, Debrecen, Kiskunfélegyháza and Pécs.

Constitutional Status

Hungary is a People's Republic, governed according to the Constitution of August, 1949 as amended in April, 1972. Parliament, elected every 4 years, is the highest organ of State power. It elects the Presidential Council, composed of the President, two vice-presidents and seventeen other members. The Presidential Council exercises power when Parliament is not in session. It also recommends the election or removal by Parliament of the Council of Ministers, the highest organ of State administration. The Prime Minister heads the Council of Ministers. The Prime Minister is also a member of the Central Committee of the Hungarian Socialist Workers' Party, whose First Secretary is János Kádár. The Party exercises a high degree of control over all social, political and economic activity: this control is, in the case of the armed forces, exercised through a political directorate within the Ministry of Defence. All individuals have a constitutional liability for military service: the Constitution states that 'military service and the defence of their country are the duties of all citizens'.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role and Commitment

The armed forces have the dual role of maintaining internal security and defending Hungary against foreign enemies. It is most improbable that they could undertake independent military operations outside the borders of Hungary. They would, in the event of a major conflict, form part of a joint Warsaw Pact force under Soviet control.

Deployment

The army comprises one (or two) tank divisions, and five (or six) motor-rifle divisions, one of which is at cadre strength.

These forces are all stationed within Hungary, the tank divisions in west Hungary and the motor-rifle divisions in central Hungary. The Soviet Southern Group of forces, consisting of two tank and two motor-rifle divisions, together with a tactical air army, is stationed in Hungary and has its headquarters at Budapest.

Recent Operations

Elements of two Hungarian divisions participated in the invasion of Czechoslovakia in 1968. They operated under very rigid Soviet control, and it has been suggested that their performance was not impressive. Hungarian troops take part in the normal run of Warsaw Pact exercises. During the 1960s they operated mainly with Bulgarian and Romanian forces in the relatively unsophisticated 'Southern Tier' exercises, but they now participate in fully integrated manoeuvres.

ORGANISATION

Arms of Service

These are similar to those of the Soviet ground forces.

Operational

Units and formations are organised on the Soviet pattern.

RECRUITMENT, TRAINING AND RESERVES

Recruitment and Training

About 60% of Hungarian servicemen are 2 year conscripts; the remainder are extended service and regular NCOs, and regular officers. There is compulsory pre-conscription military training, the length of which was increased by legislation in early 1976. Training has much in common with that of the Soviet ground forces, and includes substantial amounts of political education.

Reserves

Approximately 163,000 reservists with recent military service are available, and this number could be greatly increased by the mobilisation of former conscripts still of military age. The Workers' Militia is lightly equipped, and carries out part-time training.

EQUIPMENT AND ARMS INDUSTRY

Equipment

The overwhelming majority of Hungarian military equipment is of Soviet design, although some items are produced, with modifications, within Hungary.

Small arms: M-48 SMG 7.62 mm short, copied from the obsolete Soviet M-41 PPSH; 7.62 mm assault rifle (similar to AK-47, but has hollow plastic butt and pistol grip); other small arms are of Soviet design

Artillery: of Soviet pattern: about 300 76 mm, 85 mm and 100 mm, 250 122 mm and 125 152 mm; 500 medium and heavy mortars; and 100 multi-barrelled rocket-launchers

Armour

Tanks: about 1500 medium tanks, mainly T-54/55s and T-62s

Reconnaissance vehicles: 130 PT-76 light tanks, and about 600 BTR-40 BPs, FUG M-1963s and FUG M-1966s; the latter two vehicles are also used by the Polish and Czechoslovakian armies, where they are known as OT-65s and OT-66s; they are designed and produced in Hungary; FUG M-1963 is turretless, while FUG M-1966 mounts a turret containing a 23 mm cannon and a 7.62 mm MG

APCs: BTR-40s, BTR-60s, BTR-50 PKs and BTR-152s

Aircraft: 108 combat aircraft: nine interceptor squadrons with MiG-15s, -17s, -19s and 21s; about 30 An-2, Il-14 and Li-2 transports; about 25 Mi-1, -4 and -8 helicopters

Naval vessels: about 20 gunboats and minesweepers

Missiles: about 35 Frog and Scud SSMs with HE warheads; two air-defence battalions with 100 SA-2 Swatter, Snapper and Sagger anti-tank missiles

World Armies

Arms Industry

The Hungarian arms industry lags well behind that of Poland. The FUG series of reconnaissance vehicles and the Csepel range of trucks are Hungary's main military products.

RANK, DRESS AND DISTINCTIONS

Rank

Officers (worn on the epaulette)

Hadseregtábornok	Four silver stars on gold braid epaulette
Vezérezredes	Three silver stars on gold braid epaulette
Altabornagy	Two silver stars on gold braid epaulette
Vezerőrnagy	One silver star on gold braid epaulette
Ezredes	Three silver stars on partially braided epaulette
Alezredes	Two silver stars on partially braided epaulette
Órnagy	One silver star on partially braided epaulette
Százados	Three gold stars on epaulette
Főhadnagy	Two gold stars on epaulette
Hadnagy	One gold star on epaulette
Alhadnagy	One silver star on epaulette with vertical strip of gold braid

Note: all officers' epaulettes are edged with twisted gold braid

Regular NCOs (worn on the epaulette)

Főtörzsőrmester	Three silver stars above horizontal braid band
Törzsőrmester	Two silver stars above horizontal braid band
Őrmester	One silver star above horizontal braid band

Note: all regular NCOs have an edging of twisted silver braid to their epaulettes.

Long-service NCOs (worn on the epaulette)

Főtörzsőrmester	} As for regular NCOs, but without braid edging to epaulette
Törzsőrmester	
Őrmester	
Szakaszvezető	Three small stars in inverted 'V'
Tizedes	Two small stars, side-by-side

Conscripts (worn on collar)

Szakaszvezető	Three small silver stars in inverted 'V'
Tizedes	Two small silver stars, one above the other
Őrvezető	One silver star
Honvéd	No badge of rank

Dress

Parade dress consists of a light-brown single-breasted tunic and trousers of the same colour, worn with a Soviet pattern steel helmet. Walking-out dress is similar, but a light-brown peaked cap replaces the helmet, and shoes, rather than boots and anklets, are worn. A short khaki blouse replaces the tunic for walking-out in summer. Officers may be seen in a special gala walking-out dress with white peaked cap and white tunic. Khaki denim blouse and trousers, with a soft khaki peaked cap, are worn in barrack dress. Two types of dress may be encountered in the field: one closely resembles barrack dress, and the other consists of a mottled green and brown jacket and trousers. Boots and webbing anklets are black; equipment, NBC protective clothing and tank suits are of the Soviet pattern.

Arm-of-service badges are worn on the collar in parade and walking-out dress. These insignia are in yellow metal and are, in the main, self explanatory. Arm-of-service colours are worn, in the same order of dress, on collar patches and cap piping; they also form the background colour of officers' epaulettes. Most arms and services wear green patches and piping. Armoured troops wear black, while generals, field artillery and air-defence artillery wear red. All ranks wear a shield bearing the letters MN in silver on the upper left arm of all except barrack and combat dress.

Distinctions

Most of the decorations currently awarded were instituted in March, 1953. The senior order is the Order of Merit of the People's Republic of Hungary, conferred on both soldiers and civilians.

CURRENT DEVELOPMENTS

It undoubtedly took the Hungarian army a considerable time to recover from the effects of the 1956 revolt. Although only a few units actually joined the rebels, many soldiers took advantage of the disturbances to go home without leave, and some participated as individuals in the fighting. The damage done in 1956 was probably repaired by the mid-1960s, and the Hungarian army is now reasonably well-trained and politically reliable. Its less than distinguished performance during the invasion of Czechoslovakia might reflect a conscious unwillingness to suppress a popular movement, or might simply have resulted from inadequate training. It is, in any case, unreasonable to use such an operation as an index of an army's fighting qualities; there is no reason to believe that the Hungarian army would not perform creditably in a war against foreign enemies.

RICHARD HOLMES

INDIA★

HISTORY AND INTRODUCTION

The Army of the Indian Republic traces its descent in unbroken line from the armies raised and maintained by the British in India, at first through the agency of the East India Company, and then under the British King—Emperor and his Government of India.

Although in the ancient Hindu empires there were standing armies, and regular troops organised into corporate bodies, the conventional method of raising troops in India, when the European merchant adventurers arrived in the sixteenth century, was the *jagirdari* system. This, like the feudal system in Europe, was a system of military tenure, except that in India the assignee, or *jagirdar*, held not the land, but the right to collect the tax produced by the land allotted to him. With the proceeds of this wealth he was required to maintain a stated number of armed troopers and horses, and to pay their wages for a specified limited time if they were called up for government service. This system was used by the early Muslim conquerors, the Sultans of mediaeval Delhi and south India, by their neighbouring Hindu kingdoms, and by the Mughal empire and its successor States. As was the case with the European feudal system, as long as the central Government was powerful enough to enforce its authority over its powerful fief-holders, the *jagirdari* system was economic and simple to operate, but when the central power declined, these vassals tended to become independent rulers setting up their own dynasties, and to use their military contingents as their own personal forces.

The type of army produced by this system was very like the feudal arrays of mediaeval Europe. The main fighting arm was the cavalry, yeoman landholders with their sons and retainers, and their own (or their proprietors') horses and weapons, armed with sword, lance, shield and dagger, and possibly a matchlock for artistic effect. Each trooper was the business end of a weapons system, consisting of grooms, grass-cutters, tent-pitchers, armourers and so on, forming a vast dismounted element. The central government provided a nucleus of full-time professional troops, including the artillery park, and a few disciplined infantrymen employed as bodyguards and household troops.

As the Mughal empire declined in the early eighteenth century, its various provinces turned into independent successor States, each contending with the other for control of land and sources of wealth. India once more became prey to invasion by armies from Afghanistan. In the north-western plains, the militant Sikhs of the Punjab began to carve out their own kingdoms. In central India the renascent Hindu power of the Maratha confederacy established new dynasties, and the Rajput kingdoms also threw off the yoke of Muslim domination. The European trading companies with settlements in India imported Europe's wars into the already war-torn sub-continent, and by diplomacy, gold, bluff and sheer military power, established themselves as minor Indian powers on their own account.

Against the old fashioned hordes of individual Indian horsemen, the disciplined fire-power and parade-ground manoeuvres of well-trained European infantry and field artillery were bound to be victorious. Only the lack of manpower held them back, until the French, followed by the British, discovered that Indian soldiers, dressed, trained and equipped in the European way, were a passable substitute for the home-grown product, and were cheaper and easier to raise.

The battle of Palasi (Plassey) in 1757, where 900 British soldiers and 2000 Indian sepoys overthrew a combined Indian host of 50,000 in a morning, and where the greater part of that host never came into action at all because the British had bought off its commanders, showed equally the moral and military bankruptcy of the existing Indian system. Britain's naval supremacy, and the involvement of her European rivals in wars at home, left her the only real European power in India after 1763. By 1822 the British had become not merely a major power in India, but the paramount power. In 1858 they abolished the titular remnants of the Mughal dynasty, and the British Crown replaced the East India Company as the agency of British rule, a process formally completed in 1877 when Parliament sanctioned the Queen of England, adding the style 'Empress of India' to her titles.

By the middle of the nineteenth century the superior military organisation and technology of the British had given them direct control over the most fertile and populous areas of the sub-continent. The only areas to avoid direct annexation were those composed of jungle, desert or mountain, which were both unprofitable to govern and unsuitable for European tactics. While the ferocity of Indian soldiers, the ability of their commanders and the weight of their numbers often made the British pay dearly for their victories, and at times even scored local success, the only native armies to meet the British in the plains on level terms were the Marathas and the Punjab kingdom of Lahore, both of which, and especially the latter, maintained standing armies in imitation of the British system, with good field artillery, and trained by European military advisers.

From the earliest times, the British forces in India were divided into three separate and independent armies: those of Bengal, Madras and Bombay, the three 'presidencies' from which the British had extended their rule over provinces of

* See also Appendix 2.

India. Bengal was directly ruled by the Governor-General of India, and the Bengal Army was directly under the Commander-in-Chief, India. The other two presidencies and their armies had their own Governors and Commanders-in-Chief who were only indirectly controlled by the Government of India, in Bengal. Each army was made up mainly of Indian units under European officers, but also included a few units in which all ranks were recruited from the United Kingdom for permanent Indian service. These were all employees of the East India Company, but each army also included a small contingent of units from the regular British army, stationed in India and periodically relieved by other units from the UK or elsewhere in the British empire. During their tour of duty in India, the pay and other running costs of British army units were provided from the revenues of the Government of India, not by the British tax-payer. The reason for this was that these soldiers were defending India, and if they were not required there they could be disbanded and the British taxpayer spared the cost of maintaining them.

The great watershed in the political and military history of British India was the great Mutiny of 1857–8. The contributing causes of the Mutiny were varied. It was, as evidenced by the degree of support given to it by many Indian princes and ordinary people, in part a protest against the seemingly endless, and often unjustified, annexation of Indian States by the British. It was also a protest against the way in which the British, as they took over territory, interfered with ancient, if inhumane, religious customs, and brought in modern inventions and modern practices, undermining the rigid system of caste division on which Hindu society rested. Paradoxically, excessive respect for caste division was one reason for the rotten state of discipline in the Bengal Army. Another reason was the vicious system of giving extra pay for duty at frontier stations or for civilian employment, which encouraged officers to transfer away from their own regiments, and resulted in regiments in rear areas, where the Mutiny broke out, having few officers actually in post.

The peculiar frightfulness of this Mutiny, which was virtually confined to the Bengal Army and the north Indian plains, was that it took place in a settled area. Not only did the mutineers, supported by local mobs, murder European officers and civilians, but also their wives, and most horrible of all in the eyes of the British soldiers (far away from their own families), their little children as well. The Mutiny was fought, and quelled, with all the ferocity associated with servile wars, the innocent suffering with the guilty, and never again was there so trusting a relationship between Briton and Indian as had previously been enjoyed.

The native element of the Indian Army was reduced in size from 226,000 to 150,000. The European element was raised from 40,000 to 75,000, all from the 225,000 strong British Regular Army, into which the East India Company's European troops were incorporated. Indian artillery was reduced to a handful of mountain batteries, officered by the Royal Artillery, and Indian sappers and miners were placed under the Royal Engineers. The East India Company was abolished, and its Indian troops, with their British officers, became servants of the Crown controlled by the newly established India Office, whose Secretary of State sat in the Cabinet in London. The India Office was in fact an amalgam of the East India Company's home establishment, and the Board of Control for India was a government agency through which the Company's political affairs had been effectively regulated by Parliament since 1784. The Indian Army, including its British contingent, was controlled by the Secretary of State for India, not the Secretary of State for War, and the Commander-in-Chief, India, was responsible to the Governor-General of India and the India Office, not to the Commander-in-Chief of the British army. Two out of the three Commanders-in-Chief of the local Indian armies (Bengal, Madras and Bombay) were provided by the British army, and when a post was given to a general of an Indian army, his successor had to be from the British. Troops from the Indian establishment could be used for overseas campaigns unconnected with Indian defence needs, but in such cases they were paid for from British, rather than Indian, revenues.

With only 150,000 men to recruit from a population of 400,000,000 people, in a country where military service was generally regarded as an honourable and desirable profession, the British could afford to be very selective. During the late nineteenth and early twentieth centuries, they increasingly restricted recruiting to certain classes and communities, predominantly from the Punjab and northern frontier areas. One reason for this was the historical fact that the mutinous Bengal Army had been defeated with the aid of new troops raised from the recently conquered province of the Punjab. The men from this part of India are generally taller and sturdier in physique than men from the central and southern areas. The Punjab is also the home of the Sikhs or 'disciples', originally a peaceful religious group, whose members were driven by Mughal persecution to adopt warlike practices, and who had many old scores to settle with the last Emperor in Delhi, where the mutineers set up their capital. From their record in the Mutiny, the Punjabis were deemed to be more trustworthy and better soldiers than the men of the U.P. (Uttar Pradesh — the north India plain) who had formed a majority of the old Bengal Army. When that army was reformed, the Punjab units filled up the vacant places in its list, and the number of 'Hindustani' units was gradually reduced. A similar process occurred in the two smaller armies. The poor performance of some Bombay units during the Second Afghan War, and some Madras units during the Third Burma War, resulted in a sweeping condemnation of the material from which these armies were recruited. Critics included officers of the larger Bengal Army, smarting from the airs adopted by officers and men of the two armies which had not mutinied. It was argued that in India there were many communities. Some were naturally warlike, brave and manly. Others were timid, weak and effete, either from the effects of generations of conquest and oppression or from the enervating effects of a tropical climate, or because years of peace under the British had made them unaccustomed, and therefore unfit, to bear arms. Most 'martial' classes, as defined by this theory, came from the Punjab and the northern borders, where there was a long history of fighting and other disturbances, whereas the 'non-martial' classes included almost by definition the majority of the population of western and southern India, the areas allotted to the Bombay and Madras Armies, respectively.

World Armies

What the advocates of this theory failed to remember was the adage that there are no bad troops, only bad officers. As long as the Bombay and Madras armies were restricted to their own districts, the chance of active service, and in particular frontier service, was minimal. This state of affairs, while reflecting great credit on the political management of the country, was unpopular with the British officers of those armies, for although the soldiers did not wish to serve far away from their home in peace-time, the officers had little chance of distinction unless they did so. Accordingly, the best officers tried to join the Bengal Army, and the worst were content to stay in the peaceful south. Under such officers, several units proved unfit for combat when the chance came, and their failure was made the pretext for the gradual restriction of recruitment to an ever-narrowing number of communities. The so-called martial classes, on analysis, proved to be essentially agricultural peasant proprietors, among the educationally most backward and (perhaps on that account) politically the most inert, in the whole of the Indian empire.

The reform of the Indian Army in 1902 under Lord Kitchener attempted to remedy the situation by bringing all units into a common sequence, and abolishing the terms Bengal, Madras and Bombay. (The separate armies and commanders-in-chief had been abolished in 1895.) Every unit became liable for peace-time service anywhere in India, including the north-west frontier, where skirmishes with the Pathan tribes were always liable to occur. This was used, however, as a pretext to reduce still further the number of 'down-country' regiments, and replace them by men of the desired 'martial classes'.

Kitchener's reforms produced an army intended primarily for the defence of India's north-west frontier against aggression by local tribal, or European (i.e. Russian), forces. Internal security (the actual occupation and holding down of India) was given secondary consideration in view of the apparent stability of the British position, although units were to be given equal practice in both roles. The field army consisted of nine infantry divisions and eight cavalry brigades. The divisions were each to have an Indian cavalry regiment, a field brigade and a mountain brigade of artillery, three infantry brigades of one British and two or three Indian battalions, a pioneer battalion, sappers and miners, and medical units. As had been the case since 1857, the Indian troops carried firearms of a pattern discarded by the British on re-arming with better weapons.

It was this army, designed and trained virtually as a colonial auxiliary of the powerful British forces, that was flung into the holocaust of World War I. Two army corps were in action against the Germans in France and Flanders by November, 1914, and by their sacrifice helped the small band of British Regular and part-time Territorial soldiers hold the line until Kitchener's New British Armies could be trained and sent to the front. Another Indian Expeditionary Force went to Mesopotamia, to fight a bloody campaign against the Turks. Others fought in Palestine, East Africa and Salonika. By 1918, more than half a million Indian soldiers were under arms. Although officers and men endured the test and stood the strain, the system which supported them did not. The low number of British officers in each unit (eight to a battalion instead of twenty-four in the case of the British army) meant that a small number of officer casualties had a serious effect on the fighting capacity of units — especially as they could not easily be replaced in the esteem, or even the comprehension, of their soldiers. The careful balance of classes and communities between the troops and companies of a unit, created over a period of years, could be wiped out in an hour by the mass destruction wrought by modern weapons. Indian officers and NCOs from one community could not easily be posted to command men of another, even within the same regiment. A system built to withstand the casualties, suffered by tens and twenties, in a frontier war, collapsed when asked to deal with casualties suffered by the hundred. The favoured martial classes were unable, sometimes unwilling, to meet all the demands made on them by recruiting parties. High prices on the farm, high wages in the factories, both proved strong counter-attractions to young men whose first priority was to feed their own family rather than fight for a distant King-Emperor in a cause they dimly understood. The valour, determination and good conduct of those who did join up, and who fought in distant lands for the British, even though their own homes, families and liberties were not threatened, and who endured the risk of wounds, disease and death in every unpleasant and extreme form, must always be a shining example of what the ordinary Indian soldier (the sepoy or *sipahi*) can achieve.

A number of reforms were introduced in the post-war period. Units were renumbered and regrouped, the cavalry reduced in number and the infantry formed into large regiments each with a number of battalions able to send reinforcements to one another. The ancient *silladari* system, whereby the trooper (or *sawar*), in return for a higher rate of pay, supplied a cash deposit and paid monthly dues to his commanding officer for the supply and upkeep of horse and clothing, was at last abolished. However, the army still looked towards the north-west frontier, now fearing the red dawn of Soviet Russia, and ignored the north-east, where the rising sun of Japan was to be the real enemy. Although in the stress of war many classes had been regarded as at least temporarily martial, the small peacetime army once again denied their young men the chance of service, and restricted entry to the traditional groups. What could not be changed was the forward pace of political development. Despite official attempts to portray the leaders of the nationalist movement as agitators and ringleaders, whom the British and Indian soldiers were defending against assault by real and savage enemies, political discontent grew steadily. Troops were increasingly used to quell civil disturbances, to the detriment of their training for war. By 1939 the one-third of the British regular army normally stationed in India was little more than a garrison force, unable to be withdrawn for service elsewhere for fear of weakening the British hold over the country.

A further reform was conceded only reluctantly, under pressure from Indian public opinion. This was the 'Indianisation' of the officer corps. Before World War I, the commissioned officers of Indian units were all expatriate Britons, educated as cadets at the Royal Military College, Sandhurst with their British army contemporaries. Indian officers did not hold

commissions, and were promoted only after long service in the ranks. They acted as sub-unit leaders and as advisers and assistants to their British squadron, company or battery commanders.

From the early years of the twentieth century, Indian nationalists began to ask why, when Indians were able to enter the highest ranks of the judiciary, the civil service and other branches of government employment, they were excluded from service as commissioned officers in their own army. The victories of the Japanese forces in the Russo-Japanese war had shown that Asian officers could successfully employ the techniques of modern war, and there was no reason why Indian officers should not be as good as the Japanese.

The British argued that the young men of the martial classes lacked the necessary Western education, and that the sons of the middle-class urban intelligentsia, who were educated, were non-martial. The martial classes replied that they had shed their blood in the British cause, and had been promised commissions during the Great War, and that it would be unwise for the British to alienate those on whose support the British position rested. The urban *élite* pointed out that war experience had shown that men of all classes could be brave, and that an independent India would be one nation, not a collection of communities. The British dragged their feet, partly on grounds of the ultimate security of their rule, partly because the Indian Army officers had traditionally been drawn from the less affluent end of the British middle class. Every one of the limited number of vacancies given to a young Indian meant one less for a young Briton, at a time of world recession and large-scale unemployment. A further difficulty was the imagined reluctance of British officers to serve under men of a different race and colour. Nonetheless a small but steadily increasing number of Indian cadets of 'martial' and 'non-martial' background, were commissioned, until the outbreak of World War II swept away such scruples, and large numbers of Indians were granted war-time commissions.

A further subject of controversy between the British and Indian politicians was the type of armament issued to Indian soldiers. Nationalist spokesmen asked why, if the British really meant to see India a self-governing dominion, Indian soldiers had to be worse armed than their British comrades. The answer was, again, military security, but as this was at variance with declared policy, the British had to yield. The first batteries of Indian field artillery were formed in 1936, and anti-aircraft batteries were raised shortly afterwards. By 1945 the Indian artillery consisted of more than 80 regiments of all natures. In the case of the cavalry arm, a combination of 'horse' tradition, demands for internal security and the cost of new vehicles, resulted in the Indian cavalryman being even slower than his British counterpart to convert to a mechanised role. During the 1930s, Afghanistan and Iran, who were still regarded as the most likely enemy, each had more tanks than the Indian Army. When the first Indian cavalry was motorised, it was given unarmoured lorries to drive it to the battle, and trained to dismount and fight on foot. The collapse of many Indian units before the Japanese onslaught in Malaya and Burma was due in part to a feeling of having been let down by their British rulers, in the inferior nature of their equipment. Of the 60,000 Indian officers and men taken prisoner, one third joined the Indian National Army, a force raised by the Japanese to fight for an independent India and spearhead the march on Delhi. In the event this force achieved little, but it was a serious warning to the British that Indian soldiers shared the aspirations of their fellow citizens, and their blind support could not be taken for granted.

During World War II the Indian Army rose to a strength of 2,500,000 men of all classes. It saw service in north Africa, Eritrea, the Middle East, Europe, Burma, Malaya, and elsewhere in south-east Asia. It operated the most complex mechanical and electrical equipment, and the most modern weapons, tanks and artillery. The collapse of the 'martial class' theory was hastened by this expansion, for it was the urban, educated soldier who proved most useful in a modern army, and the backward farm boys who had to struggle to achieve the desired standard. As in World War I, although the traditional martial classes fought well and bravely, men from other backgrounds proved their valour too.

In 1947 the Indian empire and its local forces divided into the two Dominions of India and Pakistan, each with its own army. Of the 500,000 men then under arms about one-third went to Pakistan, two-thirds to India. Wherever possible unit identities were preserved, often by posting Muslim and Hindu or Sikh soldiers between units to ensure a religious homogeneity. Pakistan made it clear that no non-Muslims were acceptable in the army of a State whose whole existence was based on a desire to defend the Islamic way of life; but India, a secular State, accepted Muslim soldiers from her own territory with open arms.

After independence the Indian army emerged as a long-service all-volunteer regular army of about 280,000 men. This was by no means an inevitable or natural development, for many argued in favour of a short-service conscript army, to build national unity, on the Japanese model. Others advocated a militia system such as the Chinese Communist People's Liberation Army. Some felt that the survivors of the Indian National Army, who had fought for independence, should have a place in the new army. There were even suggestions that the army, which had after all been a tool of the imperialist oppressors, should purge its guilty past by massive civil-aid projects alongside the workers and peasants, digging ditches, reaping the harvest and building roads (Gandhi even advocated cleaning sewers).

The forces of military conservation withstood these attacks, and many senior officers encouraged the continuity of pre-independence institutions (such as the officers' mess system) in order to maintain high standards of efficiency and *esprit de corps*. British Indian military traditions were maintained not because they were British, but because they were the Army's, and the Indian Army continued to commemorate victories won over Indian enemies as well as those won over Afghans, Turks or Germans. Political respectability was won as early as 1948, when the army went into action in defence of the new India. A short action in Hyderabad ensured the incorporation of that State into the Indian Union. In Kashmir, Pathan tribesmen, carried in Pakistani army lorries, under Pakistani army officers, and finally with regular Pakistani army

World Armies

support, waged a major old-style frontier campaign against Indian troops hurriedly brought up from the plains. In 1961 a 'walk-over' in Goa against the unresisting Portuguese nevertheless revealed serious logistic weaknesses — the result of 14 years' continuous neglect of the army by politicians committed to non-violence and neutralism.

In 1962 Sino-Indian border disputes in the Himalayas led to serious fighting in which the Indian army suffered a major defeat, with 3000 of its soldiers killed or missing, and 4000 taken prisoner. Indian troops found themselves with their Lee Enfield bolt-action rifles against AK-47 assault rifles, their pack howitzers outranged by heavy mortars, their thin cotton uniforms against Chinese quilted clothing. And, whereas the Chinese were acclimatised, Indian soldiers went down in droves from the effect of altitude sickness and frostbite. While the men fought bravely when they had the chance, poor generalship and bad staff work made their sacrifice of no avail. There was slackness at lower levels too — signallers opening on the same frequency every day so that they could be easily jammed, axes and digging tools forgotten, anti-tank weapons left behind. Above all the logistic problems of fighting a campaign in the Himalayas with inadequate communications had been gravely underestimated.

The Indian army arose from this defeat like a phoenix from the ashes. The politicians abandoned non-alignment and bought weapons from whoever would sell. Public opinion supported the expenditure of scarce resources on military hardware. Ten new mountain divisions were formed (the British, for all their fighting on the hills of the north-west frontier, had never formed Indian mountain troops other than their pack batteries). Regular army strength was doubled to 750,000 men, incompetent generals were removed, and the army, under new leaders, adopted a new spirit of urgency and realism.

In September, 1965 India and Pakistan waged a conventional war against each other in the plains of the north west. Fighting lasted about 21 days, both sides being trained and equipped in Western style. The major engagement, the tank battle of Sialkot, lasting over 2 weeks, was the largest tank battle at that time since the end of World War II. Pakistani Patton tanks, though technically better than India's Centurions, proved too complicated for their crews to maintain. The battle was a drawn one, each side losing about 300 tanks, 4000-5000 men, and 50 combat aircraft. Indian infantry proved less effective than the Pakistanis' at patrolling and infiltration, and the Royal Pakistan Artillery and Royal Pakistan Air Force scored notable successes against Indian field and light air-defence batteries. One of the most important lessons was that India could not rely on British resupply in such emergencies. The British government, in the interests of 'neutrality', cut off the supply of spares and ammunition for the British-built equipment it had sold to India. Severing links forged over many years, the Indian army turned away from dependence on the British, and made up its deficiencies with Soviet-designed material, much of it from Czechoslovakia.

In 1971 India intervened in the struggle for independence then being waged in East Pakistan. Within 12 days the Indian army smashed its way across the plains and rivers of east Bengal to Dacca. The Pakistani garrison, some four and a half divisions well provisioned and supplied, were completely overwhelmed by the three Indian corps (each of two or three divisions, mostly mountain troops) opposed to them. Many Pakistani units fought fiercely, but it was clear that with the whole country opposed to them they could do no more than fight a delaying campaign hoping for foreign intervention or successes in the west. The speed, ferocity, and flexibility of the Indian attack, including a parachute brigade drop, brought about a more rapid and spectacular victory than either side anticipated.

On the western front both sides fought a tank war, as in 1965. Infantry held defensive positions along rivers and minefields while the armoured troops manoeuvred between them. Indian Special Forces harassed the Pakistani rear areas more successfully than in 1965, and the Pakistani air force, not trusting its mainly Bengali ground crews, ceded air supremacy to the Indians. Pakistani offensives were contained by the Indian army, which counter-attacked and seized objectives of local tactical value. When Dacca fell, Pakistan had taken no bargaining counters in the west, and the whole campaign must be counted a victory for Indian arms.

STRENGTH AND BUDGET

Population: 622,375,000

Army: 950,000

Navy: 46,000; 40 major vessels, including one aircraft carrier, two cruisers and eight submarines; 37 smaller vessels

Air force: 100,000; 670 combat aircraft

Paramilitary forces: 300,000

GNP (1975): \$89,700,000,000

Defence expenditure (1977-8): \$3,450,000,000

COMMAND AND CONSTITUTIONAL STATUS

Supreme command is vested in the President of the Republic of India. Political control is exercised by the Minister of Defence, but policy is determined by the Political Affairs Committee of the Cabinet, of which that minister is a member. It is chaired by the Prime Minister. Internal Defence Ministry policy is determined by the Defence Minister's Committee,

which consists of, besides him, the Minister of Defence Production, the three Service Chiefs, the Defence Secretary, the Financial Adviser (Defence) and the Scientific Adviser. A parallel committee is the Defence Minister's Production and Supply Committee on which additional civil servants sit. The ministry is a tri-service organisation, and its activities are co-ordinated by the Secretary, a civil servant, and his secretariat. It provides the secretariat for the Defence Minister's Committee, and the Production and Supply Committee and the Chiefs of Staff Committee. It also oversees the main interservice organisations, the Production and Inspection Organisation, Research and Development Organisation, Directorate-General of Medical Services, National Cadet Corps, Historical Section, Joint Cipher Bureau and the interservice colleges and academy.

A special branch of the Ministry of Finance, namely the Ministry of Finance (Defence), under the Financial Advisers, controls military expenditure and advises the Minister of Defence on financial aspects of defence policy. Its head is a subordinate of the Minister of Finance.

Ministers are Members of Parliament (which has its own parliamentary consultative committee on defence) and they are required to answer to parliament on defence policy, particularly during the regular defence debates.

There is a history of disagreement between the Chiefs of Staff (particularly the Army Chief of Staff) and the Minister of Defence, originally occasioned by the low standing of the Defence Minister in the hierarchy of the ruling Congress Party, which was traditionally anti-militarist in outlook, and the lack of experience of its nominees to the post. A subsequent over-compensation when the able and strong-minded Krishna Menon was appointed in 1957, led to personal and policy disagreements with the equally strong-minded General Thimmaya, who was retired in 1961, and to his replacement by a General Kaul, whom the army felt to be a Menon protégé. The *débâcle* of the China-India War of 1962 led to Menon's demotion and eventually to Kaul's retirement. More recently the Congress Party and the army appear to have developed a warmer mutual regard and a smoother system for the management of defence.

Although the three Chiefs of Staff are co-equal, the Army Chief of Staff (formerly the Commander-in-Chief) was historically superior and continues to enjoy effective primacy within his own Army Headquarters in the Ministry of Defence; he is assisted by four Staffs, which bear the traditional British titles of: the General Staff (of which he is directly Head), the Adjutant-General's Branch, the Quartermaster-General's Branch and the Master-General of the Ordnance's Branch. They are responsible, respectively, for operations, personnel, supply and procurement. Each supervises a number of Directorates, the Heads of which are administrative superiors of their own arm of service or of a particular military function. Thus the Director of Military Operations and the Director of the armoured corps, infantry and other fighting arms both answer to the Chief of the Army Staff (as Chief of the General Staff), the Director of Supplies and Transport answers to the Quartermaster-General and the Director of Ordnance Services answers to the Master-General. The State Commands, and the field formations, are under direct command of the Army Chief of Staff.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

Under the British, the Indian army was trained to fight wars, particularly minor imperial wars, rather than to maintain internal security, for which the police, or, their efforts failing, British or Gurkha units, were principally employed; only in emergencies were Indian units used to quell political riots or communal disturbances, it being considered, understandably, that such duty put the army's national, caste or religious loyalties under too great a strain. The coming of independence and the movements of population concomitant on partition having largely removed the old causes of political and communal unrest, the army has not often, despite its inheritance of the internal security role, been called upon to exercise it. It has remained a 'war fighting army' however, and has been obliged to take up the role of tribal pacification which the British exercised right to the end, though now in Assam rather than the north-west frontier. It has also been an instrument of national unification, the Princely States (particularly Hyderabad) and the foreign enclave of Goa having been incorporated into India by the (peaceful) action of the Indian army. The army has been one of the United Nations most valuable sources of troops for its peace-keeping work and it is a duty to which it attaches great importance. It has not, however, undertaken to any extent a 'nation building' role, for reasons which its peculiar and limited recruitment explain (*see* The Bangladesh War, 1971). Nor does it devote any particular effort to civil assistance work — road building or civil engineering — except in areas of military importance. In many respects, indeed, the army remains what the British left it: a highly trained and dedicated military instrument, concerned principally with the defence of the borders of India.

Commitment

India is an unaligned State. No foreign troops are stationed on its territory and, since the withdrawal of the army from Bangladesh in 1972, none of its own is stationed abroad (except for individuals in the UN Emergency Force, as already mentioned).

World Armies

Deployment

India is divided into five Commands: Southern (HQ Poona), Western (HQ Simla), Central (HQ Lucknow), Eastern (HQ Calcutta) and northern (HQ undisclosed). Southern Command covers the area of the States of Rajasthan, Gujarat, Maharashtra, Mysore, Andhra Pradesh, Kerala and Tamil Nadu. Central Command covers Madhya Pradesh, Uttar Pradesh, Bihar and Orissa. Eastern Command covers West Bengal, Assam, Tripura, Manipur, Nagaland and Arunachal Pradesh (North-East Frontier Agency). Western Command covers Jammu and Kashmir (Indian sector), Haryana, Punjab and Himachal Pradesh. Northern Command has been created by dividing Western Command; its exact area is undisclosed. All border on foreign territory: Southern on Pakistan; Western (and Northern) on Pakistan and China; Central on China and Nepal; and Eastern on Bhutan, China, Burma and Bangladesh (which it almost surrounds). The frontier with Nepal, Sikkim, Bhutan and Bangladesh is militarily inactive, but there are major concentrations of forces on the Pakistan and Chinese borders, as well as a large internal security force in Assam, Nagaland and Mizoram. The exact allocation of forces between commands is not published, but it is believed that Western Command contains three corps (I, XII and XV) each of six divisions, including 1st Armoured Division and seventeen other divisions, some of which are mountain divisions; that Central Command contains II and XXXIII Corps with four Divisions (4th, 9th, 20th and 23rd); Eastern Command contains some mountain divisions and the 8th and 57th Divisions on internal security duty, with the Assam Rifles in Nagaland; the remainder of the fighting formations, including the 6th Armoured Division, are in Southern Command, whose forces constitute a central reserve.

Recent Operations

Since independence in 1947 the Indian army has become one of the most experienced and combat-tested armies in action. Before this its units had been engaged in three major fronts — Burma, north Africa and Italy — against the Japanese, Germans and Italians, respectively for most of World War II. Unhappily much of the Indian army's warfare since 1947 has been of a semi-fraternal character, against the Pakistani army — its 'other half', many of whose senior officers are former brothers-in-arms of their Indian counterparts.

The Indian army's major campaigns are as follows.

Kashmir 1947–8

A princely State whose population was ruled by a Hindu Maharaja, it attempted to remain independent of both Pakistan and India on partition. A Muslim uprising obliged the Maharaja to call for Indian aid, in return for which he acceded to the Indian Union on October 22nd, 1947. But the success of the Indians in driving the insurgents and their Pakistani *Azad* (Free) *Kashmir* allies out of positions which penetrated Pakistan's Punjab frontier prompted the Pakistan army to intervene and led to a direct India–Pakistan conflict during 1948. The fighting, however, was on a small scale and of sporadic nature and was eventually brought to an end by United Nations negotiations in December, 1948. The ceasefire left India in possession of the Vale of Kashmir and the Pakistanis in possession of the mountains.

Nagaland 1956–present

The Nagas, a tribal people living astride the mountainous border of Burma, were reluctant to accept the transfer from British to Indian rule, even though the Indians maintained the policy of minimal interference in their affairs. Demands for independence from India were voiced, and rejected, and in 1956 open insurrection broke out. The original number of Naga 'effectives' was 1500–2500, but many more joined the rebellion, obliging the Indians to increase the strength of the local paramilitary Assam Rifles (now 18 battalions strong and largely Gurkha in recruitment) and to commit regular troops. In 1966 a sympathetic rebellion erupted among the Mizo hill people of Mizoram. The temperature of the fighting, which continues, has fluctuated but at any one time engaged the presence of 20–30 battalions of troops. Their problems are compounded by the access 'hostiles' have to sanctuary on the far side of the Burmese frontier, in an area not under the control of the Burmese government.

Himalayan Conflict with China, 1962

The Sino–Indian border east, and west of Tibet followed a line which the Chinese regard as having been arbitrarily imposed on them by the British during the era of Chinese weakness in the nineteenth and early twentieth centuries. It had been declared Chinese communist policy before their seizure of power to recover the 'lost' territories and to occupy ('liberate') such former feudal dependencies as Tibet. Tibet was occupied by China in 1950 and thenceforward the communists inherited a policy of aggressive control of the *de facto* frontier, which led to sporadic conflict with the troops with which the Indian government in their turn began to reinforce the Himalayan regions. The two main areas of confrontation were east and west of Tibet, the North–East Frontier Agency, Himachal Pradesh and Ladakh, respectively, and on October 20th, 1962 the Chinese opened large-scale attacks in both sectors. The Indian forward positions were very

quickly overrun, a penetration of 30 miles made into Ladakh and in the N.E.F.A. the whole Indian 4th Division were effectively disabled with the loss of its 7th Brigade. India appealed for help to Britain and America, who hastily ferried equipment, but on November 20th the Chinese announced a unilateral ceasefire and their intention to withdraw 20km north of the MacMahon Line (the disputed line of demarcation) in Ladakh, and of the 'line of actual control of November 7th, 1959' in the N.E.F.A. The withdrawal was completed by January 15th, 1963.

The debacle, which led to the removal of the Defence Minister, Krishna Menon, and the Chief of Staff, General Kaul, provoked national outrage, and led to an immediate and large-scale expansion of defence investment and of army numbers, and to a reorganisation of the army for mountain warfare. The development of the Indian Army as a modern fighting force dates from this episode.

Indo-Pakistani (Undeclared) War, 1965

India's humiliation in the 1962 war led to a worsening of her relations with Pakistan, which was thereby emboldened to harden its own attitude to the policing of its disputed frontiers with India in Kashmir and the Rann of Kutch (south of Karachi). There was an increase in the number of troops on the ceasefire line and in April-May, 1965 a series of clashes between regular troops in the Rann of Kutch which led in September to the outbreak of a 22 day 'undeclared war' along the western frontier. It was precipitated by the incursion on August 5th of 3000 Muslim freedom fighters into Indian Kashmir, which prompted the Indian government to send regular troops to destroy their 'staging posts' in Pakistani Kashmir. In response President Ayub Khan launched a tank attack in the Chamba sector on September 1st, and 3 weeks of fighting followed. It was again brought to an end by United Nations intervention, reinforced by the imposition of an Anglo-American embargo on arms shipments to either side. The military result was a territorial stalemate, minor gains or losses on each side of the ceasefire line cancelling each other out, but the fighting saw the largest-scale tank battle since the end of World War II — from which the Indians emerged winners in numbers of tanks destroyed — and it also testified to a considerable level of military efficiency on both sides, and, it was said, to a marked improvement in the quality of the Indian army since 1962.

Mizo Uprising, 1966

A minor insurrection among the Mizo hill people of southern Assam required the intervention of the army and added to its internal security responsibilities in the area. Unrest continues.

The Bangladesh War, 1971

The Indo-Pakistani conflict was brought on by a declaration of independence by the 'eastern wing' of Pakistan. Its Bengali population had long found themselves the poor relations of their Punjabi compatriots in the 'western wing' and the triumph of the secessionist Awami League in the 1970 elections provided the opportunity to break the links between them. West Pakistan, fearing economic hardship and international demotion should secession succeed, reinforced the units of the Pakistan army in the country and embarked on suppression. Between March and December, over 1,000,000 Bengalese fled from East Pakistan ('Bangladesh', as its Awami league leaders had proclaimed it) and had to be succoured by the Indians in refugee camps near the border. Some of them, with Bengali elements of the East Bengal Rifles, instituted their own campaign against the West Pakistanis and their Bihari allies in Bangladesh, and the fighting between these 'Mukti Bahini' and the Pakistan army soon took the form of a guerrilla war. After much diplomatic activity by both India and Pakistan, the former seeking international recognition for Bangladesh, the latter foreign support for its campaign of repression, India invaded Bangladesh on December 4th. At the same time fighting broke out on the West Pakistan frontier. In the east, where India deployed eight divisions against Pakistan's four, and could also count on the assistance of 50,000 Mukti Bahini, the campaign was short and completely successful. Within 13 days the whole of Bangladesh had been overrun by concentric advance from 20 starting points and all western troops made prisoners (about 85,000 in all). In the west the war opened on the evening of December 3rd with a Pakistani air strike on Indian airfields, modelled on the pre-emptive strikes with which Israel had assured its success against the Arabs in 1967. India had, however, taken precautions against just such an attack and its effects were small. Pakistan's ground attack which followed was equally unsuccessful: although Pakistani forces fought on unequal terms elsewhere, equality prevailed in the west (12 divisions to 13) but they were unable to cut Indian communications into the Vale of Kashmir, regarded by both sides as the key sector, and were actually obliged to yield ground in Sind. At the ceasefire, declared unilaterally by India on December 16th, and accepted by Pakistan the following day, India held 2750 square miles of Pakistani territory. In human and material casualties Pakistan was also the loser, having lost 8000 men killed to India's 3000, 220 tanks destroyed to 83, and 83 aircraft destroyed to 54; at sea 22 ships (including 2 submarines) to India's 1. In the words of the Institute of Strategic Studies Survey for 1971, 'The outcome was a triumph for the reorganisation of the Indian army after the 1962 Chinese invasion (which) had hardly got under way by the time of the 1965 war... It resulted in a complete transformation of the military equation in the sub-continent'.

World Armies

United Nations Peace-Keeping Duty

India has taken a major part in UN operations since 1948. She has maintained observers on the Egypt–Israel border, in Lebanon and in Yemen, sent a contingent to West Irian in 1962–3, a large force to the Congo (Zaire) 1960–4 and a field ambulance to Korea, 1950–3. Senior Indian officers have also served as individuals in UN peace-keeping forces.

ORGANISATION

Arms of Service

The domestic organisation of the army, virtually unchanged from the British–Indian, is strongly ‘regimental’ in character. Most of the infantry and cavalry regiments trace an unbroken ancestry into the mid-nineteenth century and some into the eighteenth (via a web of amalgamations which only experts understand). The infantry regiments are ‘family’ units, not operational units, their several battalions (six to fifteen in number) rarely serving together in the same formation. The cavalry regiments are equally ‘family’ bodies but are of a single battalion-sized unit only. Both are generally raised on a ‘community’ basis (i.e. from the same territorial/linguistic/caste group), a practice again inherited from the British, and officers and men serve throughout their regimental career in the same regiment (though officers not necessarily in the same battalion). In the corps, ‘community’ recruiting is not the rule; but the engineers preserve the old ‘Presidency’ division into Madras, Bengal and Bombay groups and recruit accordingly, and the artillery tends to recruit still from the ‘martial races’ (communities) favoured by the British.

The infantry regiments inherited from the British in order of place in the line are: Punjab Regiment (formerly 2nd Punjab Regiment; senior battalion raised 1751); Grenadiers (1779); Mahratta Light Infantry (1768); Rajputana Rifles (1775); Rajput Regiment (1798); Jat Regiment (1803); Sikh Regiment (1846); Dogra Regiment (1887); Garwhal Rifles (1891). During World War II the following were raised: the Madras Regiment; the Kumaon Regiment; the Assam Regiment; the Bihar Regiment; the Mahar (Machine-Gun) Regiment; the Sikh Light Infantry; the Parachute Regiment. Since independence the Brigade of Guards and the Jammu and Kashmir Rifles have been raised. A Naga Regiment was raised in the late 1960s and also the Ladakh Scouts (*see* Paramilitary Forces).

The Indians divided with the British the 10 regiments of Gurkha (now spelt Gorkha) Rifles, retaining the 1st, 3rd, 4th, 5th (Frontier Force), 8th and 9th. They subsequently raised the 11th, to accommodate the surplus of Gurkhas who did not wish to transfer to the British army.

The cavalry regiments in order of precedence are: President’s Bodyguard (formerly the Viceroy’s Bodyguard; raised 1775); 1st Skinners Horse (1803); 2nd Lancers (1809); 3rd Cavalry (1841); 4th Horse (1857); 7th Light Cavalry (1788); 8th Light Cavalry (1787); 9th Deccan Horse (1854); 14th Scinde Horse (1839); 16th Light Cavalry (1776); 17th Poona Horse (1817); 18th Cavalry (1842); 21st Central India Horse (1858). Raised since independence are: 61st, 62nd and 63rd Cavalry. These regiments together form the Armoured Corps. The Training Regiment, Armoured Corps Centre, Ferozepore, is the 15th Lancers.

There are in addition to these combatant regiments a number of paramilitary forces under the control of the central government, the Ministry of External Affairs, or of the States, which descend from the frontier constabulary, the Frontier Scouts and the armed elements of the Indian Police of British days. The most important are the Assam Rifles (not to be confused with the Assam Regiment) which is under the control of the Ministry of External Affairs and is responsible for internal security in Assam, and the Border Security Force.

The corps of the Indian army are: Regiment of Artillery; Corps of Engineers (Madras, Bengal and Bombay Groups); Corps of Signals; Army Service Corps; Army Ordnance Corps; Corps of Electrical and Mechanical Engineers; Remount, Veterinary and Farm Corps; Corps of Military Police; Army Educational Corps. The Medical Corps forms part of the tri-service Armed Forces Medical Service.

Operational

The organisation of units and formations is on British lines, through corps, divisions, brigades and battalions/regiments. There are two armoured divisions, seventeen infantry divisions, ten mountain divisions, five independent armoured brigades, one independent infantry brigade, one parachute brigade and fourteen independent artillery brigades, including about 20 air-defence regiments. Corps, divisions and independent brigades identified in the 1971 war were: I, XI, XV, II, IV, XXXIII Corps; 1 and 6 Armoured Divisions; 2, 4 (Mountain), 5, 6 (Mountain), 7, 8, 9, 10, 14, 17, 19, 20, 23, 26, 27 and 57 Infantry Divisions; 1 and 2 Independent Armoured Brigades; 191 Independent Infantry Brigade; 50 Parachute Brigade.

Paramilitary Forces

The British–Indian Empire maintained large paramilitary forces, consisting of three main elements: armed units of the Indian Police, which were organised on a provincial basis; the Frontier Constabulary, which maintained law and order on the ‘administered’ side of the troublesome northern (particularly north-west) frontier; and the Frontier Corps or Scouts,

which, under the control of the Indian Political Service of the Home Affairs Department, exercised influence on the 'unadministered' side of the frontier. The Scouts were wholly Muslim in composition and all the Frontier Corps — Northern Scouts, Gilgit Scouts, Chitral Scouts, Khyber Rifles, Kurram Militia, Tochi Scouts, South Wazierstan Scouts, Zhob Militia, Pishin Scouts, Makran Levies and Chagai Levies — went to Pakistan on partition.

The (independent) Government of India preserved the police structure and its remaining elements intact. Each State has its complement of armed police (e.g. the Rajasthan Armed Constabulary which played a part in the opening stage of the war with Pakistan in 1965). The government has created its own equivalent to the armed constabularies in the Central Reserve Police Force, now 60 battalions strong, distributed between 17 Group Centres (it has also assumed the functions of the old railway police) as well as a Central Industrial Security Force, which polices 'public sector undertakings'. In 1965, following the border war with Pakistan, the government created a Border Security Force: its composition is unclear — it obviously fulfils the role of the old Frontier Constabulary and it may have absorbed the Armed Constabularies of the States on the borders; it numbers 100,000. A separate force, the Assam Rifles, now 21 battalions strong and largely recruited from Gurkhas, comes directly under the Ministry of Home Affairs. The Ladakh Scouts, raised in the 1960s and fulfilling the function of the old Frontier Corps which went to Pakistan, is an army unit operating in the high Himalayas.

RECRUITMENT, TRAINING AND RESERVES

Recruitment

Recruitment to the Indian army is an extremely complex, and nowadays politically sensitive, matter. It can be understood only in historical terms, in particular in terms of the nature of the Indian mutiny of 1857. That uprising of the Bengal army against the British was put down largely through the loyalty to the British of the Bombay (and to a lesser extent of the Madras) army and of the various irregular forces, foremost among which was the Punjab Irregular (later Frontier) Force. The Bengal army was chiefly recruited from high-caste Hindus of Oudh, whereas the other forces were not. In consequence, and in the aftermath, the British resolved to diversify recruiting and to favour those tribes, castes and sects which had sided with them. These so-called 'martial races' were chiefly people of the north-west and north — Punjabi Muslims, Sikhs and Gurkhas. The reorganised Indian army came therefore to consist of regiments which were composed either of a single 'race' of proved loyalty and fighting worth (e.g. Gurkhas, recruited from outside British India) or of a mixture (organised into separate companies in squadrons within the regiment) of other 'martial races'. In time, the issue of loyalty receded but the value-judgement of 'martial worth' gained strength. The British came to consider the peoples of south, central and eastern India to be of little military value (inexplicably since it was with soldiers of these regions that they had conquered the sub-continent) and recruited preponderately from the Punjab, Rajputana, United Provinces, Baluchistan and other north-western and northern areas, and chose only those of high-caste (if Hindu) or of established military reputation (if Muslim). Thus, of the technically casteless Sikhs, the British preferred Jat Sikhs, whose ancestors were high-caste Hindus, to Mazbi Sikhs, whose ancestors were low-caste.

Independent India is avowedly a secular State, which does not favour one caste at the expense of another (unless to attempt to improve the lot of its low-caste and untouchable citizens through 'scheduled caste' legislation). Nevertheless, by 1947 so ingrained had the belief in the desirability of recruiting the 'martial races' become in the army itself — most of whose Indian officers (KCOs) were themselves of the 'martial races' — that it has proved impossible significantly to alter the system. In January, 1949 orders were officially issued to abolish recruitment by classes (the British euphemism for 'martial races') in all arms of service. This is explained in an Indian government publication* which goes on to say, 'For administrative reasons arising out of previous commitments and locations of troops, it was not possible to implement this decision immediately in the case of the infantry and the armoured corps' (i.e. the bulk of the pre-partition army and that providing its combat edge). 'Regiments composed of particular classes, through several decades, developed a certain kind of cohesion and while steps are taken to broadbase their composition, it is essential to ensure that the sentimental attachment arising out of such composition is not suddenly disturbed.' In practice, it has not even been gradually disturbed. The Indian army preserves intact the composition of the historic 'class' and 'class company' regiments; an example of the first sort is the Sikh Regiment, while the Punjab Regiment is an example of the second. However, in the regiments raised during World War II and since, the army with the warm encouragement of the government instituted an eclectic recruitment policy. The Madras Regiment, for example, enlists Indians of every religion and language of southern India, and the Mahar Regiment, which originally recruited only Mahars, recruits 'scheduled castes' (i.e. untouchables). It seems probable that other technically 'mixed' regiments, like the Brigade of Guards and the Parachute Regiment, are effectively selective, but in the reverse direction, favouring the 'martial races' once more.

It would be unfair to suggest that the army is not attempting to unfreeze the 'community' character of its fighting regiments (as it has certainly unfrozen that of the services, which are manned from a wide range of 'communities'). Since 1963 there have been deliberate efforts to introduce new 'community' representations into single or restricted 'community' regiments, but it seems that the pattern of recruiting at present is as follows:

* Veukakeshwaran, A.L., *Defence Organisation in India*, Government of India, New Delhi (1969).

World Armies

'Pure'

Mahratta Light Infantry: high-caste Maharashtra Hindus
Jat Regiment: middle-caste Hindus of Rajasthan and Uttar Pradesh
Sikh Regiment: high-caste Sikhs
Dogra Regiment: Dogras (high-caste northern Hindus)
Garwhal Rifles: Garwhalis (Himalayan foothills)
Kumaon Regiment: Kumaonis (Himalayan foothills)
Assam Rifles: Assamese*
Gorkha Rifles: Gurkhas of Nepal

Mixed Company

Punjab Regiment: Sikhs and Punjabi Hindus, high-caste Maharashtra Hindus and Muslims
Rajputana Rifles: Jat, Hindu and Muslim companies
Rajput Regiment: some battalions purely Rajput (high-caste Rajasthan Hindus), others Bengali
Jammu and Kashmir Regiments: Kashmiri Sikhs, Dogras and Muslims

Totally Mixed

Brigade of Guards: in fact consists of separate battalions of Rajputs, Punjabis and other 'martial' communities
Parachute Regiment: separate battalions of 'martial' communities
Madras Regiment: south Indians, completely mixed
Bihar Regiment: eastern low-caste Hindus and Christians
Mahar Regiment: 'scheduled caste' northern Hindus

The armoured corps is generally recruited from the 'martial races' (particularly Jats, Sikhs, Dogras, Rajputs and Maharashtras, and to a lesser extent this also applies to the artillery. The Madras, Bengal and Bombay Groups of the Corps of Engineers (under the British, respectively, the Madras, Bengal and Bombay Sappers and Miners) recruit within their own regions and fairly widely through the communities. The services are all of mixed recruitment.

The recruitment of officers is officially not influenced by 'community' considerations. In fact, the Indian Kings Commissioned Officers of the British-Indian army were 'martial' almost to a man, and the proportion remained high for many years thereafter; in 1954-5 about one-third of the army cadets at the National Defence Academy were Punjabis and 15% came from Delhi and its region, while West Bengal and Andhra Pradesh ('non-martial' regions) supplied less than 1%. Since 1962, when the great expansion of the army began, recruitment has broadened, aided by a fall in officers' living standards and a rise in the frequency and duration of postings to the Himalayan frontiers; in consequence many traditionally military families have chosen to send their sons into better-paid and less-onerous careers. It seems probable, however, that within the infantry, cavalry and artillery the officers still come predominantly from the martial communities. Community does not, however, determine with which regiment an officer will serve, nor does language — the 'command' language of the army is Hindi (though English is much spoken).

There is some difficulty in recruiting officers, standards of selection remaining high. By contrast there is none in recruiting soldiers, about 10 applicants presenting themselves for each vacancy. The prestige of the 'jawan' remains very high in rural India, and his economic status enviable. Nevertheless, there is considerable recruiting outside India: it is estimated that the army, the Assam Rifles and the Border Security Forces contain about 90,000 Gurkhas.

Training

Infantry recruits are trained in the training battalions of their regiment, others in training units of their corps. Advanced training for officers, JCOs and NCOs of the various arms and services is provided at the Armoured Corps Centre, School of Artillery, College of Military Engineering, School of Signals and Army Signals School, Infantry School, Army Services Corps School, Army Ordnance School, Electrical and Mechanical School, Intelligence Training School, School of Physical Training, Army Educational Centre and School, Army Air Transport School, School of Mechanical Transport and the Corps of Military Police Centre and School. Mountain regions training is provided at the School of Mountain Warfare, Darjeeling.

There are a number of tri-service schools for specialist and higher studies, e.g. Land/Air Warfare School, School of Foreign Languages and the Armed Forces Medical College.

Officer training is at three levels: pre-cadet, cadet and staff. In order to improve officer recruitment, the Indian government, developing an idea originating with the British, has created a number (in 1962 eleven) of 'Sainik' schools, which provide a British public-school education for would-be applicants to the National Defence Academy. The Army Cadet College at Nowgong provides similar preparation to suitable serving soldiers. The National Defence Academy (age of entry 15-17 years, length of course 3 years) is situated at Khadakvasla, near Poona, and educates cadets of the three

* The Assam Rifles is almost completely composed of Gurkhas.

services. Army cadets then proceed to the Indian Military Academy, Dehra Dun (age of entry eighteen; length of course 1 year). The I.M.A. is also open to 'Direct Entry Cadets' from high school or university and to technical graduates. Special-to-arm training is given to freshly commissioned officers in the centre or school of his arm. Staff training for captains and majors who pass the competitive examination is given at the Defence Services Staff College, Wellington, south India (course 1 year) and senior staff training at the National Defence College, Delhi, a tri-service institution (course 1 year; civil servants also attend). Indian officers regularly attend overseas staff colleges.

Reserves

Under British rule, India had three reserve forces: the Regular Reserve of the Indian army, composed of time-expired soldiers; the Auxiliary Force (India) — the A.F.I., a volunteer force of Europeans and Anglo-Indians, most of the latter railwaymen as the titles of their units revealed (e.g. The Great Indian Peninsular Railway Regiment); and a small Territorial Force (raised 1920), for Indian volunteers.

The military value of both the Auxiliary and Territorial Forces was small and they disappeared at independence, understandably so in the case of the A.F.I., since its principal role was as a buttress of British power. In 1951, however, the Indian government decided to re-raise a Territorial army, but it proved difficult to recruit and in 1956 an amending act was passed to draft certain categories of government servant into its ranks. Meanwhile, in May, 1955 the government decided to set up a National Volunteer Force (*Lok Sahayak Sena*) to give basic military training to 500,000 men, who would not be liable for military service. The idea seems to have been to create a peoples' militia on the Chinese pattern: the force was not to be under control of the army. In 1965, however, the *Lok Sena* was disbanded, on the creation of a Home Guard, 1,000,000 strong, in the villages, and at the same time the Territorial Army was reorganised and strengthened. It is claimed that 100 units of the T.A. were embodied in 1971.

India now has two reserve forces, the regular army reserve of 200,000 trained soldiers, and a Territorial Army of 40,000. Additionally, there exists a National Cadet Corps, training in which is compulsory for male students in all government colleges.

EQUIPMENT AND ARMS INDUSTRY

Arms industries have been long established in India. The Moghul, Mahratta and Sikh States had their own, the Sikhs in particular producing artillery pieces of the first quality. The East India Company was also quick to establish arms and ammunition factories, a gun foundry being established at Dinajpur in 1768. After the Mutiny of 1857, however, the government instituted a policy of restricting the quantity and nature of arms issued to Indian units: the Indian infantry and cavalry received weapons of an older generation than those carried by the British, and Indian artillery units (except for a few light mountain batteries) were disbanded altogether. The production of weapons in India consequently declined and it was not until the winning of World War II, when the impossibility of equipping the greatly expanded Indian army from British factories became evident, that belated efforts were made to increase the military productivity of the sub-continent.

The Indian army at independence in 1947 was therefore ill-equipped and lacked the means to re-equip itself fully from existing factories. It was to persist in that state for over a decade, as a result of the policies of eschewing foreign military aid (part of the diplomacy of non-alignment) and of concentrating investment in civil projects. These policies, admirable as they were in a developing country, were overturned by China's attack on India in 1962. Strategic necessity and popular outcry compelled the government both to accept foreign (largely Russian and British) military assistance, both in the form of goods and cash, and to increase its own investment in military plant.

There are now over 20 defence plants in operation: Jabalpur (vehicle plant), Chandigarh, Shahjahanpur, Kanpur, Bhandara, Varangaon, Nasik, Kirkee, Bombay, Ishapore, Calcutta, Koraput, Secunderabad, Hyderabad, Bangalore (aircraft and electronics), Avadi (tank plant), Vishakhapatnam, Tiruchirapalli, Khamaria, Ambajahari, Aruvankadu, Ambarnath and Muradnagar. India produces most of its own small arms, artillery, ammunition, assembles its own military transport vehicles, builds its own tank, and manufactures high-performance combat aircraft, soon to its own design. It is not yet militarily self-sufficient, but may well become so within the next decade. The cost has been grave; about 20% of government expenditure goes on defence.

Pistol: 9mm Browning HP (Belgium)

Sub-machine-gun: 9mm Sterling (Britain; Indian manufacture)

Rifle: 7.62mm Ishapore (Indian version of Belgian type)

Machine-gun: 7.62mm LAA4 (British Bren; Indian manufacture) and 7.62mm MAG 58 (Belgian FN)

Mortars: 81 mm MI6A1 (Britain; Indian manufacture) and 4.2in Brandt (France; Indian manufacture)

Anti-armour weapons: 57 mm RCL (USA; infantry platoon anti-armour weapon); 106 mm RCL (USA; equips the support company of the infantry battalion); SS-11 ATGW (France; equips the support company of the infantry battalion); ENTAC ATGW (France; equips the support company of the infantry battalion); 100mm anti-tank gun (USSR; equips the support company of the infantry battalion)

World Armies

Air-defence weapons: 40 mm L60/70 gun (Britain; equips the light-air-defence batteries); 3.7 in gun (Britain; equips the heavy-air-defence batteries); Tigercat SAM (Britain; equips the missile-defence batteries; 40 in service)

Artillery: 75 mm pack howitzer (USA; obsolescent); 75 mm howitzer 75/24 (India; equipping mountain batteries); 76 mm mountain howitzer (Yugoslavia; equipping mountain batteries); 25-pounder gun-howitzer (Britain; Indian manufacture; divisional artillery under replacement by Indian gun); 100 mm gun (USSR; divisional artillery); 105 mm (USA; under replacement); 105 mm pack howitzer (Italian-British; divisional artillery); 105 mm Abbot SP gun (Britain; equips the artillery of the armoured division); 130 mm gun (USSR; divisional medium artillery); 5.5 in (Britain; under replacement); 152 mm gun (USSR; divisional medium artillery); 203 mm howitzer (USA; corps heavy artillery); 203 mm gun (USA; corps heavy artillery)

Armour:

APCs: BTR 50/152 (USSR), OT-62 and OT-64(2A) (Czechoslovakia) (about 700 in service; equip the infantry of the armoured divisions)

Light tank: PT-76 (USSR; equips the corps reconnaissance regiments; 120 in service) and AMX-13 (France; equips some of the armoured regiments; 130 in service)

Medium tank: T-54/55 (USSR; equips some of the armoured regiments; 900 in service); Centurion (Britain; equips some of the armoured infantry; 100 in service) and Vijayanta (India; equips some of the armoured regiments; 700 in service)

Aircraft: Krishak and Auston 9 (Hindustan Air; equip the air observation posts of the artillery; 60 and 15 in service, respectively)

RANK, DRESS AND DISTINCTIONS

Rank

India has preserved the unusual rank structure inherited from the British, who divided the officers of their units into three groups in ascending order: NCOs; native officers (later Viceroy's Commissioned Officers — VCOs); and British officers (later when Indians were admitted to the group, King's Commissioned Officers — KCOs). The intermediate rank of VCO originated from the earliest days of the British-Indian Army, when British officers were few in number and native gentlemen of military experience were naturally employed to fill officers' posts. The system was then retained for reasons of economy and efficiency, and survives into independence through the force of tradition. VCOs are now known as Junior Commissioned Officers (JCOs); they are always promoted from within the ranks of the regiment, in which they fill the majority of junior command appointments (Platoon Commander, etc.). The senior JCO (Subedar-major) acts as principal assistant to the commanding officer.

Officers

*Field Marshal	Asoka lions badge, crossed batons in wreath
General	Asoka lions badge, three stars, crossed swords
Lieutenant-general	Asoka lions badge, two stars, crossed swords
Major-general	Asoka lions badge, one star, crossed swords
Brigadier	Asoka lions badge, three stars
Colonel	Asoka lions badge, two stars
Lieutenant-colonel	Asoka lions badge, one star
Major	Asoka lions badge
Captain	Three stars
Lieutenant	Two stars
Second-lieutenant	One star

JCOs

Subedar-major	Asoka lions badge on cloth backing
Subedar	Two stars on cloth backing
Naib subedar	One star on cloth backing

NCOs

Havildar	Three chevrons
Naik	Two chevrons
Lance-naik	One chevron
Sepoy	—

* The rank was created for General Manekshaw, the victor of the 1971 war and the then Chief of the Army Staff.

In the cavalry, the title of subedar is replaced by *risaldar*, havildar by *dafadar* and sepoy by *sowar* (rifleman in rifle regiments). Private soldiers are collectively known as 'jawans'.

Dress

Dress is strongly 'regimental', each regiment jealously preserving its particular distinctions (colour and shape of turban, etc.) which have been inherited from the British-Indian Army, and remain, with the removal of imperial symbols, identical. The every-day order of dress is khaki drill, cut to traditional British Indian Army patterns. The President's Bodyguard retains the scarlet ceremonial uniforms worn in Viceregal days.

Distinctions

Servicemen who won British or British Indian awards before independence retain them, but India has instituted its own system of decorations: the Param Vir Chakra, equivalent to the Victoria Cross, for outstanding bravery in the face of the enemy; the Maha Vir Chakra and the Vir Chakra for acts of lesser bravery; and the Asoka Chakra, class 1, 2 and 3, for bravery other than in the face of the enemy. They are awarded without regard to rank.

Indian infantry regiments (rifles excepted) carry two Colours on parade, the President's and the Regimental; cavalry regiments carry a standard or guidon.

CURRENT DEVELOPMENTS

The Indian army, for over a hundred years before 1947 the most important implement of military power in south and south-east Asia, has staged a remarkable recovery from the decline it underwent in the first two decades of independence. Its triumph in the 1971 Bangladesh war has shown it to be markedly superior to the Pakistani army (with which it nevertheless retains a curious step-brotherhood through their common parentage); its ability to police and, if necessary, defend the Himalayan frontier with China since its expansion, re-equipment, reorganisation and retraining after 1962, appears distinctly credible.

Its life is, however, not problem-free. The cost of maintaining an army of 900,000 throws an increasing strain on the Indian economy and budget, particularly in view of its need to match, largely from domestic resources, the equipment of neighbouring armies which are either militarily self-sufficient, like China, or the beneficiaries of generous foreign aid, like Pakistan. It has a particular problem in recruiting sufficient officers of the right quality, difficult to understand in view of the graduate and middle-class unemployment prevailing in the country, but nonetheless real for that. It has a more general recruiting difficulty, in that the government, and it itself, are committed to the principles of secularity and equality of opportunity for all communities of the Indian population. 'We are all Ksatriyas (members of the martial caste) now', said Defence Minister Chavau in 1965, but its component units have particular recruiting traditions, which they are unwilling to modify. The solution of that particular problem must wait, however, upon a general transformation of Indian society. In the shorter term, it is threatened by the danger of its induction into the political life of the country. The Imperial Indian Army was notably 'apolitical' — given of course, that its British officers were instruments of British imperial rule. That army nonetheless successfully transmitted to the army of independence, chiefly through the careful selection and training of Indian officers at Sandhurst and the Indian Military Academy, the belief that the political and military careers are absolutely separate. As a result, and almost alone among the armies of ex-colonial States, the Indian army has remained wholly uninvolved in domestic politics, but that has also been due to the central government's success in ruling largely by consent. In consequence such internal disorders as have occurred have not exceeded the ability of the strong and disciplined armed police forces to repress them. The assumption of emergency powers by Mrs Gandhi's government in 1975 threatened to set in train events which might have brought the Indian army's admirable apoliticality to an end. As it happened, the 'emergency' was ended by an electoral reverse and, in the subsequent settling of accounts, the army was again untouched by criticism of its role during that controversial period.

[History and Introduction: T. A. HEATHCOTE]

INDONESIA

HISTORY AND INTRODUCTION

The Republic of Indonesia was proclaimed somewhat hesitatingly by Mr Sukarno and Dr Hatta on August 17th, 1945. Within a few weeks it was involved in a struggle for existence which lasted for some 4 years, and during those weeks the various elements which were eventually to make up the Indonesian army exploded into action all over Java and Sumatra. These fighting units frequently were very different in their origins and subscribed to very different political ideologies. They were in many cases ill-disciplined and for some time many sections were not really under the control of the army commanders. For these reasons they added elements of tumult and additional conflict to the already turbulent and complex pattern of the Indonesian revolution; but there was more than this to be noted about the armed forces in the revolution. Sometimes sections backed particular political parties and so entered into the disputes over leadership and political strategy, while at others the army or major parts of it played an independent role at odds with the civilian government. There was, as a result of this, no unity of outlook in the army, no sense of any subordination to civilian powers, but rather a tradition of being involved in politics, and above all a sense that the army was at least equal to political parties in its contribution to the direction and ultimate success of the revolution. The struggle for independence produced an attitude of mind as a consequence of which the army came to believe that it had as much right (or perhaps a greater right) to help in shaping society as any other group or institution; but it also produced an army that was far from agreed about how society should be shaped.

During the colonial period the Royal Dutch East India Army (KNIL) had controlled the archipelago. In 1940 it was just under 40,000 strong, but was mostly officered by Europeans and Eurasians. A very large section of the rank and file and NCOs were recruited among the Christian population of Menado and Amboina. This continued to be the case when the war with Japan ended, and the KNIL was rebuilt and used in the fighting against the nationalists in Java and Sumatra.

In 1950, shortly after independence, the KNIL was disbanded, 26,000 out of the total strength of 65,000 being incorporated into the Indonesian army, the remainder being either demobilised or becoming members of the Netherlands army. Those who joined the Indonesian army were not given positions of prominence, even where their training might have suggested it. Thus, the Indonesian army has no institutional links with the KNIL, but there were some individuals who had been officers in the KNIL in 1940 and who joined the revolution, and they did have a disproportionate influence. One such was General Nasution who had been to the Bandung Military Academy, but more commonly Indonesian army officers had been NCOs in the KNIL and later received training as officers by the Japanese. President Suharto comes into this category.

The purpose of the Japanese in giving Indonesians military training was to create local defence forces for their own purposes, not to provide local peoples with an instrument to further their national ambitions. Nevertheless, a large number received some sort of training. Those who were officers were imbued with the Japanese 'fighting spirit', and in addition many of them were indoctrinated with a fanatical hatred of things Western. The result was that when the war ended, while there was nothing that could strictly be termed an army, there was a mass of fighting potential. It was led by young men, often very young, fanatically brave and reckless, and determined to use it to prevent the re-establishment of colonial rule, but with very little sense of discipline and little understanding of military organisation or strategy. It has been estimated that in the early years of the independence struggle, perhaps 500,000 men were in some way or other linked with a fighting unit.

The most important of the organisations set up by the Japanese was the PETA (Fatherland Defence Force). Eventually it numbered 37,000, organised in 69 battalions (in Java and Bali), and was officered by Indonesians up to the level of battalion commander. Some 3000 officers were trained altogether, amongst them being President Suharto who rose to be a company commander, and a former Commander-in-Chief, General Jani, who was murdered in the abortive Gestapu coup of 1965, and was a platoon commander. In addition there was the Hei-ho, a sort of Home Guard numbering just over 26,000, but entirely Japanese officered, and various paramilitary organisations from which derived the guerrilla forces known as 'Lascars'. The latter were often uncontrollable, and gave more than their fair share of trouble to all concerned, friend or foe. Much more important, qualitatively, were the officers trained in guerrilla tactics at three special centres set up by the Japanese, and who, according to Pauker, were the hard core of the resistance to the Allies when they returned in 1945.

Battalion commanders were drawn overwhelmingly from the traditional *élites* — the minor aristocracy and Islamic leaders — rather than from the Western educated. Officers of more junior rank were very young and frequently students, and they tended to be particularly influenced by the values of their Japanese teachers. One effect of this was to make much of the army unsympathetic to political leaders like Sjahrir and Hatta who were striving for a settlement, and were thought to be too willing to accept the point of view of the Dutch. Twice, a part of the army went as far as rebelling against the Republic's political leaders, and on the first occasion there was widespread sympathy with the rebels. In July, 1946 the 3rd Division of General Sudarsono kidnapped Sjahrir (who was Prime Minister at the time) in an attempt, in alliance with Tan

Malakka's Fighting Front (PP), to wrench the Republic on to a more radical course. Sjahrir had been involved in a political struggle with the PP for some months. He was well aware of the sympathy of important sections of the army to PP, and built up the Siliwangi Division which was controlled by men who were Dutch trained. Together with the Mobile Police Brigade, they were responsible directly to him, and it was units from these forces that rescued him. A real danger of civil war within the army existed, until Sukarno persuaded the Commander-in-Chief, General Sudirman, to come off the fence and leave Tan Malakka without significant army support. Two years later, army units were again involved in an attempted left-wing coup, when the 4th Division supported the proclamation of a communist government at Madiun, in September, 1948. Once more the Siliwangi Division was instrumental in restoring the situation. On this occasion, Sudirman was firmly loyal to the government, but even so it was estimated that 35% of the army supported the People's Democratic Front (FDR). One reason for the rising, or at least its timing, was a plan of the Prime Minister, Dr Hatta, to rationalise the army, reducing it from its large and rather unwieldy form to one appreciably smaller, and most importantly, more disciplined, centrally organised and controlled. This would have undermined the influence of the communists and other radicals, although the main intention of the government was to deal with the military weaknesses which had been only too apparent at the time of the 1st Dutch Police Action of July, 1947. The reduction would have involved a rapid reduction of the army from 360,000 to 160,000, but it was far from complete when the 2nd Dutch Police Action led to the overrunning of the Republic's remaining territory in Java, and the capture of most leading Republicans.

Political authority was transferred to Republican leaders in Sumatra who were still at liberty, but in the months after the 2nd Police Action it was the army in Java which kept the spirit of Indonesian nationalism alive through a guerrilla campaign which made life difficult for the Dutch. It is perhaps an exaggeration to say that this compelled the Dutch to negotiate, but one can understand the army's pride in its achievements, and also its feeling that the politicians came to terms too readily when accepting the Roem-van Royen Agreement. Many of them would have preferred to have fought longer, and gained more favourable conditions in the financial area, and a more satisfactory settlement over New Guinea. They may have been wrong in this, but their belief that it was true has shaped their relations with the civilian leadership to a very significant degree.

So far the analysis has been confined to what happened in Java, and this is reasonable for it was the area within which the drama was to a very large extent played out. Nevertheless Sumatra was also very much involved. It had been controlled by the Japanese 7th Army whose headquarters were at Singapore, and this meant that although a policy similar to that of the 6th Army in Java and Bali was followed, and analogous organisations set up to train Sumatrans in self-defence, the revolution in Sumatra was somewhat apart and followed a course which had its own, and rather different, logic. The links with Java were somewhat tenuous, and in the case of military units there was, as a consequence, a quite independent development. Essentially there were two armies. In contrast, in east Indonesia (Kalimantan, Sulawesi and the eastern islands) the Japanese navy had been in control and followed a more conservative policy, not training local groups. Here the Allies regained control with relative ease and handed power back to the Dutch in an orderly way, and therefore these islands did not contribute any units to the Indonesian army (except, of course, for those members of the KNIL who were absorbed in 1950). It is therefore clear that when independence came at the end of 1949, the Indonesian army was no more than the sum of its parts, and these parts differed in many ways from each other according to whether they were guerrilla or 'regular' units, whether they originated (and remained based) in Sumatra or Java (and indeed which part of Java), whether their officers were predominantly Dutch trained or Japanese trained, and where their political loyalties lay. One should note finally that throughout the struggle for independence, operations had tended to be at battalion level, a tendency encouraged by the need to conduct guerrilla operations after the 1st and, even more, the 2nd Dutch Police Actions. Thus the army had a somewhat nebulous existence at higher levels; above battalion or brigade level, it had hardly operated as an army, its senior officers had not handled large units and had a limited appreciation of strategy. Independence would require a formidable measure of consolidation and unification to be carried through.

STRENGTH AND BUDGET

Population: 135,770,000

Army: 180,000

Navy: 39,000 (including 12,000 marines)

Air force: 28,000; 39 combat aircraft (about 170 others held in store)

Paramilitary: 12,000 armed police (Police Mobile Brigade); 100,000 militia

GNP (1977 estimate): \$43,100,000,000

Defence expenditure 1978-9: \$1,690,000,000

The armed forces in 1966 numbered about 500,000 and the military budget represented almost 5% of the GNP. Since then the number has been reduced to 320,000 (1971-3) and then further to 247,000 (1977). The army's size has declined rather less, and in 1977 was 180,000, almost three-quarters of the armed forces. The defence budget was at first cut back even more severely and in 1970-1 was only 2.25% of GNP, but since then it has crept up again and is now about 3.5%. The total defence expenditure budgeted for in the 1978-9 financial year is \$1,690,000,000. During the period of retrenchment, the

World Armies

reason for which was the priority given to economic development, the naval and air forces suffered worst, with the result that much of their more sophisticated equipment became unserviceable and no replacements occurred. These two services were permitted in the mid-1970s to order ships for coastal defence, and aircraft for surveillance and reconnaissance, transport, ground attack and counter-insurgency work. This new equipment was either absolutely central for the defence of a vast archipelago, or intended for use in close collaboration with the army and thus enhancing its efficiency. It should be noted, however, that in 1977–8 the air force was allowed to order 12 F-5E, four F-5F and eight Hawk aircraft at a total cost of \$130,000,000, marking a sharp break with previous policy, and probably indicating a need to raise the morale of the service. The same applies to a lesser degree to the navy.

COMMAND AND CONSTITUTIONAL STATUS

The unity of the armed forces has been a fundamental concern of *Orba* (the military government period). Once the services had been purged of those considered disloyal or worse, a number of organisational changes took place aimed at reinforcing unity. In 1967 separate service ministries disappeared and in 1969 separate Commanders-in-Chief also went. At the top is the Ministry of Defence and Security, at first headed by President Suharto, and then from 1973–8 by General Panggabean who also held the position of Commander-in-Chief of the Armed Forces. He was replaced in March, 1978 by General Yusuf. In place of the separate Commanders are largely managerial Chiefs of Staff for each service.

It is perhaps appropriate at this stage to note the current terminology used for the armed forces and its component services. The armed forces are known collectively as ABRI (Angkatan Bersenjata Republik Indonesia), and consists of four services. These are:

- The army, ADRI (Angkatan Darat Republik Indonesia),
- The navy, ALRI (Angkatan Laut Republik Indonesia),
- The air force, AURI (Angkatan Udara Republik Indonesia),
- The police, POLRI (Kepolisian Negara Republik Indonesia).

The first three, the fighting services, are known as the TNI (Tentara Nasional Indonesia). This jargon, and much similar to it, is used almost to the exclusion of more normal language in Indonesian military studies.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role, Commitment and Deployment

It was a fundamental belief of *Orba* that economics is supreme and this is probably still true. It governed its diplomacy to a considerable extent, in that the pressing need for aid and private investment in the late 1960s and early 1970s inevitably entailed a peaceful and essentially pro-Western policy. It also led to self-denial over re-equipment on the part of the armed forces, though, as we shall see, this has ceased to be so to a quite significant extent in the last 2 or 3 years. This emphasis on the pursuit of economic success came from a belief that it is the most important factor in avoiding conflict in society, the basic aim of *Orba*. Experience has resulted in some doubts as to whether it is as simple as this, and this is a question we shall have to return to in the final section. The virtual elimination of political party activity has the same motivation. A prosperous, depoliticised society is a united one, the argument runs, and in turn a united society helps ensure the unity of the armed forces. As we shall see a number of organisational changes have been introduced to the same end. Here, of course, the argument comes full circle for a united army is the ultimate guarantee of all the policies leading to national unity.

In practice the army has displayed few, if any, differences about ultimate goals, but there have been disputes about means. In the years after Gestapu, when policy lines were more fluid, a distinctly different line was advocated by General Dharsono of the Siliwangi Division — which may be termed a more openly anti-Sukarno line and a more Western approach. Dharsono fell out of favour, and power and influence became concentrated particularly in the hands of Diponegoro officers. This division has its base in central Java and its officers were more compromising, more indirect in their approach to their ends, more traditional and less Western in their attitudes. Suharto shared this approach, as indeed did Sukarno. It is one of the factors which gave a unity of outlook to the *Orba* and armed forces leadership during the crucial early years.

The Siliwangi–Diponegoro split, although it still exists in some senses, is far less significant than it was in the 1960s. There is an obvious difference of attitude between the Javanese divisions, and it is almost inconceivable for a Diponegoro general to be appointed to command the Siliwangi, but it is no longer valid to refer to them as having totally different cultural attitudes. There are certainly differences in society between Westernisers and traditional Javanese, and representatives of both will be found in the army, but it is not institutionalised any longer. It would be more important to point to the antipathy of ABRI to those who wish to bring Islam into politics and government.

The Indonesian army has had a fairly active life in the operational sense; it has however been even more constantly engaged in politics. The intensity of its involvement in political matters during the independence struggle made it unlikely

that it would readily accept a subordinate role in which it was the mere instrument of the government. This was true even when a smooth working arrangement with the cabinet existed in the earliest days, for as Herbert Feith argues, army leaders emphasised that '... the army was and would remain a political body... composed of nationalists who had joined the force from political conviction, not to earn a living, and could not therefore be stripped of political influence... Withdrawing their subordinates from politics at regional and local levels implied a *quid pro quo*. That *quid pro quo* was a great amount of influence for themselves as army leaders in all such affairs as affected the army's interests and tasks.'

During the early 1950s they came to feel not only that they did not have the influence that they expected, but that they were being prevented from carrying out their tasks effectively by the way in which parliament and the political parties operated. They were not free to deal with Darul Islam in the way they would have preferred because of the influence of some Islamic politicians. Policies agreed on for re-equipping the army were not carried through, and although at the beginning some measure of modernisation and reorganisation was achieved, further steps were frustrated. Not only was this so, but political parties sucked the army into their own conflicts, which had the effect of both deepening political divisions inside the army and even worse dragging its affairs through the mire.

In 1952 Parliament, with Sukarno playing a Macchiavellian role in the wings, frustrated policies aimed at reorganising the army through the elimination of those who were unable to meet the standards demanded in a modern army. This threatened those who continued to hold to the more inspirational approach of the 'fighting spirit', among whom were many friends and allies of the President. A number of army leaders including the Chief of Staff, Nasution, had already been thinking of an anti-Parliamentary coup, and now in a confused episode in October, 1952, they attempted what is probably best construed as an attempt to press Sukarno to bring about constitutional change. It was frustrated by the President and used by him to replace Nasution by a member of the opposition PETA group, Bambang Sugeng.

He could not hold his position, and a further crisis in 1955 brought Nasution back, as Major-General, to the position of Chief of Staff. His return was to have a decisive impact on constitutional development and in shaping civil-military relations. Although he was not undisputed master of the army for a year or so, his views, certainly from 1957, can be said broadly to be those of the army. They may be summarised as follows. He had a profound antipathy to political parties for the way in which they encouraged disputes and opened up differences, and through their activities in parliament and elsewhere caused indecision, inefficiency and, worst of all, subversion of the unity of the nation and the army. Parliamentary government encouraged the political parties in these undesirable activities, and it was therefore preferable to have a Presidential system of government with an executive to some extent insulated from both parties and the assembly (which should be at most consultative).

Elections held in 1955 made the system of parliamentary government even more difficult to operate than before, and as the deadlock continued both army and President determined that there should be a fundamental change in the constitutional arrangements. Before this was achieved the nation went through a serious crisis with its climax in the civil war of 1958, and in this the army was divided even more than the nation. The divisions in Sumatra and the other islands had never been integrated with those of Java or controlled very effectively from the centre. In 1956-7 a number of regional grievances surfaced, particularly concerned with restrictions on trade, and army units in the outer islands took the lead in organising smuggling on a large scale. It is not going too far to talk of *de facto* economic autonomy. A year later in 1958 this regional discontent joined with political opposition to the constitutional plans of the President and discontent about his economic policies, and resulted in the PRRI rebellion.

Nasution had during 1957 devoted a lot of energy to conciliation of regional commanders, but once rebellion was proclaimed he seems to have had no doubt about the need to crush it. He acted swiftly and decisively, and in restoring unity so rapidly brought the army back to the position of power and influence it had had in 1949. His own standing was also greatly enhanced, and as a result much was done to remedy the unsatisfactory situation which had developed in the early and middle 1950s. The army's own command structure was changed so as to weaken the position of commanders in the regions, and for the first time a really unified army existed. It was inevitably dominated by the Javanese divisions, particularly the Siliwangi and the Diponegoro (based on Central Java), and ideas emanating from Java consequently guided its progress and development.

In addition to this the army ensured that when Sukarno's conception of guided democracy was given constitutional form, the position they required for themselves was institutionalised. The new system provided for the army (and other national institutions) to play a direct role in political life as a functional group, allocated seats to it in the People's Consultative Assembly (theoretically the most powerful organ of government), and allowed it to be represented in the Cabinet. In its role as a functional group it had a duty to be politically active in securing the aims of the national ideology and the national purpose. At the same time, of course, the army was still considered as an instrument of government for the maintenance of security, and in this way we have the emergence of the concept of the army's Dual Function.

The army was already involved in the economy, having taken over control of the Dutch enterprises following the expulsion of the Dutch in 1957 in order to forestall the communist trade unions. With its new view of an extended role in society, the army sought further economic influence to remedy the rather poor performance of previous years. But by far the most important enlargement of its area of involvement in society came from the formulation of the new defence policy, Territorial Defence, and its corollary Territorial Management. These ideas, based on the experience of 1945-9 and influenced by foreign doctrines of 'total' national defence by the whole population, were put forward as the only logical defence policy for a poor under-industrialised country which at the same time insisted on following an independent,

World Armies

non-aligned foreign policy.

The defence scenario envisaged falls into three phases. In the first phase the enemy was if possible to be prevented from making a landing, but given the weakness of the navy and air force this was likely to fail. The second phase would be dominated by the army which, using tactics involving the maximum flexibility and mobility, would inflict constant damage on the enemy while avoiding any action likely to involve its own destruction. During this phase preparations would be made for a counter-offensive in the final phase to drive the enemy out. The success of this policy, particularly in Phase II, would depend upon there being total national resistance. This meant that the army would need the full co-operation of the civilian population who would need to be prepared to advance. The army was only too well aware that, in the various insurgencies of the 1950s, it had not been very successful, and had not been able to rely upon civilian assistance even where it should have been possible to gain it. This led to a wide ranging analysis of its relations with the population as a whole, and to the conclusion that it was an essential part of its tasks to assist in land reform and agricultural improvement, the development of co-operatives or of local industry, and the construction of roads, schools, mosques or whatever was needed by the villagers. These ideas were first used in the successful campaign of the Siliwangi Division against the Darul Islam which led to its final defeat in 1962.

On the grounds that it was a prerequisite of national defence, these policies were made the basis for a national programme of Civic Action. No one was naïve enough to ignore the fact that in undertaking a Civic Action programme, the army was engaging in a socio-political campaign which in an area like Central Java competed with the activities of the Indonesian Communist Party (PKI). To take it one stage further, Civic Action might be of value in national defence, it was even more likely to be important in the case of conflict between the army and the PKI. Not surprisingly the PKI was intensely hostile to the whole concept, but at the beginning the army was able to impose considerable restrictions on what the PKI could say and do. The fact that it managed to survive, and from about 1962 to re-emerge as a serious political force, was due to President Sukarno's need to break out of the straight-jacket of consensus imposed on him by the army. To gain freedom of action he did everything he could to build up the parties and particularly the PKI, and then to act as a pivot around which the parties and army moved. This balance of forces he termed NASAKOM — involving national, religious and communist blocks each of which represented a significant section of the nation, and therefore could not be ignored. NASAKOM represented a consensus totally alien to that which the army had created in 1958–9 and one which it greatly disliked. It had never forgiven the PKI for the stab in the back in 1948 at Madiun, quite apart from its rejection of its social and political philosophy.

The change in the army's fortunes paradoxically came about through the two military campaigns of the 1960s, the West Irian conflict and Malaysian Confrontation. The former greatly strengthened the President's position, for he was closely associated from the beginning with the demand for a transfer of sovereignty, and his diplomacy brought it about. The PKI as the most vocal of anti-imperialists also benefitted. In the case of the services, the Navy and Air Force gained most from the West Irian affair in that they were considerably expanded and received much modern equipment. Their political weight increased, and they were encouraged to use it in an independent way by Sukarno. This division in the services was made more worrying to the army by the fact that radical influences grew in all services, particularly in the air force. Confrontation had more far reaching effects, for the PKI was very much in the forefront, demanding more and more effective action, accusing the army of being lukewarm, and using the whole episode to demand changes of policy and changes in society which would strengthen its position and open up new possibilities. As in 1957 the army took over foreign enterprises to pre-empt the communist trade unions and so again extended its economic influence, but the PKI mounted a violent campaign for land reform, and a noisy and sustained one for the creation of a Fifth Force to consist of armed peasants and workers. This would take over the task of Confronting Malaysia from the other four services. It was a demand which the army equally strenuously resisted, but it indicated the extent to which the PKI was on the rampage.

In contrast the army was on the defensive, uncertain of its path and itself divided. Those who had seen the extent to which the West Irian affair had changed the political scene must have been concerned about another glorious war of liberation. If Britain chose to stand her ground the prospects were somewhat uninviting, and indeed promised little but trouble; while victory, if West Irian were a guide, seemed likely to advance the fortunes of the army's rivals rather than its own. But many were far from cautious, looking forward much more to the expected glory, and unattracted by the alternative of Civic Action. Equally, it was difficult to withstand Sukarno's vivid flow of oratory denouncing the Malaysian concept as an OLDEFO (Old Established Forces, a Sukarno acronym for Western imperialists and their lackeys) plot to frustrate the democratic wishes of the North Kalimantan people. The split in the army was symbolised by the promotion of General Yani as army Chief of Staff in place of Nasution who was given the somewhat empty post of Chief of Staff of the Armed Forces in June, 1962. Nasution was steadily reduced in stature over the next 2 years, and increasingly Sukarno was apparently able to impose his will.

Nevertheless the overt moves of the PKI to increase its power met with solid army resistance, and it was probably this which led to the Gestapu plot with its elimination of several of the key figures of the army. Gestapu showed the extent of the PKI's penetration of the services. Not only was the Chief of the Air Force deeply involved and the Halim air base the scene of the mutilation of the generals, but the army itself was seen to have been affected. Considerable sections of the Diponegoro Division had been subverted, and it has been stated that 430 officers had eventually to be purged.

More fundamentally, the events immediately following, involving the massacre of hundreds of thousands of communists and their supporters, showed how deep and bitter the divisions in Indonesian society had become. Sukarno did his best

to protect them against the wrath of the army and the knives of Muslim youths and others, but failed and in failing brought about the collapse of the political structure on which his dominance had been based. For a while those who still sympathised with him or held him in some awe prevented his removal from office. But after March 11th, 1966 when General Suharto, the victor of Gestapu, was granted wide ranging executive powers, the office did not mean much. It meant nothing at all a year later when Suharto was sworn in as Acting President. In this way began *Orba* (*Orde Baru* — new order), the third period of constitutional history since 1949, and one this time entirely shaped by the army.

Constitutionally there were no fundamental changes. The establishment of a Presidential Constitution in 1958 had, as we have seen, been brought about with Nasution's approval, and the institutions of Guided Democracy had provided a place for the armed forces. That place was now to be much larger, and those forces in society which had perverted Guided Democracy were in contrast to have no place. But the legal relationships between institutions were unaltered. The People's Consultative Assembly (MPR) which lays down policy lines and elects the President was to consist of 920 members, 460 being Members of Parliament and a further 112 being selected in proportion to party strength, 131 coming from provincial assemblies, 10 representing less successful parties, while 207 were nominated by the President from the armed forces and other functional groups. In Parliament, of the 460 members, 100 were nominees of the President again from the armed forces and functional groups, and 360 elected. Elections held in 1977 resulted in the government sponsored group (*Sekber Golkar* — Joint Secretariat of Functional Groups) winning 231 seats. Thus in Parliament the government could rely on the support of 331 representatives of functional groups, and in the MPR it could rely on an even higher percentage. The other parties represented in Parliament and the MPR are the Partai Pesatuan Pembangunan (PPP) which is the most significant of them and represents Islam, and the Partai Demokrasi Indonesia which combines Christians and those of a secular disposition. One writer has contrasted the NASAKOM structure of Sukarno with the NASAGOLAB as he terms it, i.e. National plus Religious plus *Golkar* plus Armed Forces. The last two are obviously overwhelmingly preponderant, and reflect the almost total dominance of government by the armed forces and those groups which identify with the armed forces. The way in which the electoral laws were designed to suit the armed forces, and the election campaigns of 1971 and 1977 were managed by them in favour of their chosen instrument, *Golkar*, equally reflected the power of the army and its determination that that power should be sustained.

However, in *Orba* the armed forces have penetrated into society in many other ways than simply the constitutional and political, indeed there is no significant aspect of the nation's life with which they are not concerned. Territorial Defence and Territorial Management have been enormously expanded into what the former Minister of Defence, General Panggabean, named 'Total People's Defence and Security'. The logic of this concept is that defence and security involve the whole people as well as the armed forces, and that the effectiveness of the people (and the armed forces) depends upon the economy, the educational system, the social structure, the moral and cultural vitality of the nation, and so on. Ultimately it is difficult to make any fundamental distinction between the two functions of the armed forces, that of serving defence and security, and that of acting as a social force. Indeed critics of this development have said that Dual Functionalism (*Dwi Fungsi*), as it is known, has no meaning whatsoever in the current context, and there is only one function, that is, there is total control of society by ABRI.

At the highest level, military personnel are found in charge of economic enterprises, the most obvious example being that of Pertamina which was built up by General Ibnu Sutowo, running local government — provincial governors are members of the armed forces — and in control of public utilities. ABRI recognises this as being a vital part of its activities. Officers who undertake these tasks have to resign from the active list, and they then come under the classification of *Kekaryaan* (Civilian Duties). There is a *Kekaryaan* section at HANKAM (Department of Defence and Security) with a Chief of Staff overseen by a *Kekaryaan* Committee of some considerable power, which is concerned with the placing of ABRI personnel in the economy and public life. Not only is this so, but the highest military academic institution, the National Defence College (LEMHANNAS), has recently become rather more like a National College of Administration than its name would imply, and is training senior officers of the rank of brigadier and above for their civilian tasks, rather than being centred on defence studies. It is now virtually a requisite for appointment to top administrative positions to have passed through it.

At one time the rationale for *Dwi Fungsi*, especially in the economic sphere, was that the armed forces were the *Samurai* of Indonesia, but in the last few years this view has been looked at rather sceptically. One reason has been the evident failures, above all the heroic misjudgements of Ibnu Sutowo in the management of the national oil conglomerate Pertamina, which piled up such enormous debts that it required the Bank of Indonesia to use all its resources to rescue the company, and indeed the State. It is argued that there is no obvious evidence that members of ABRI are abler in managerial terms, although it is accepted that ABRI is the most significant modernising force in the country. *Dwi Fungsi* brings with it the dangers of abuse of power and of corruption, and critics say that the negative sides of *Kekaryaan* are at least as prominent as its more positive ones.

When one turns to look at the Civic Mission in its more traditional form as envisaged by Nasution, army units are seen to be involved at various levels. In rural areas they build roads, schools and mosques, and help in small irrigation projects. Sometimes, and this is particularly the case in the outer islands, they are involved in more ambitious schemes. In Central Sulawesi there is an enormous project for bringing 17,000 ha of land into cultivation, though, one should hasten to add, this is not being managed even primarily by the army. One army battalion has a specific amount of land allocated to it, which it is bringing into rice cultivation. Further north, in Menado, numbers of Bailey bridges have been erected to improve

World Armies

communications.

Two features of the Civic Mission must be stressed. One is the way the army is integrated at every level into local society. The Provincial Liaison Committee at the Daerah (Province) level is headed by the KODAM commander (see later, p.321), and at each level downwards the same is true. Every village in the country has its village NCO who works closely with the local police and the village head, and puts up proposals to the KODIM (see later, p.321) for implementation. The other is the extent to which the army prepares its officers for these activities and organises itself for them. As will be seen, much time is spent at Staff College in analysing the social situation, and training officers for carrying out the civic mission (see later, p.322). In addition the army staff organisation besides having four branches which deal with such standard military matters as operations, intelligence, personnel and logistics has a fifth branch known as *territorial*. On the one hand this devotes itself to the specific defence aspects of territorial defence, but it is also concerned with the Civic Mission as such. This pattern of organisation is found at all levels from the KOWILHAN (see p.321) to the smallest administrative unit. It need hardly be added that such a system, besides preparing for territorial defence, provides an internal intelligence network covering every island and every village.

Recent Operations

The Indonesian army was involved in fighting almost before it was born. It was often necessary in August and September, 1945 to fight the Japanese for arms, although the severity of the fighting varied considerably. Admiral Mountbatten had ordered the Japanese not to surrender to unauthorised persons, an order often disobeyed or impossible to carry out. He also ordered them to hold certain key towns where prisoners of war and internees (APWI) were concentrated, and severe fighting occurred at Bandung and Semarang. When British forces landed, they moved to protect the APWI where possible and a number of actions took place, notably a series of running battles on the road from Djakarta to Bandung and in the Semarang – Magelang area of central Java. At Surabaya a major battle occurred in which the Indonesians fought fanatically against the 5th Indian Division, incurring 5000 casualties of whom probably 2000 were killed. This battle is considered by some to have been decisive in dissuading the British from making an attempt to conquer Java, although in fact all the evidence points to their never having had such intentions. Apart from this, it was the first major battle and the most bloody encounter of the war for independence, and in consequence November 10th is celebrated in Indonesia as Heroes' Day. The whole campaign pinned down three British (Indian Army) divisions from October, 1945 until May, 1946 when they began to withdraw, which is a tribute to the tenacity of the Indonesians. It could also be argued, however, that it left them less able to withstand the Dutch Police Action of July, 1947 which resulted in the rather rapid seizure of the economically significant areas of Sumatra and most of Java apart from the central area. Resistance could only take the form of guerrilla action, and this was a constant problem for the Dutch. Preparations had been made to continue this in central Java, and when the Dutch did overrun this area in December, 1948 they did not find their occupation a very comfortable one. Nevertheless, it was not crucial, international pressure being far more important in persuading the Dutch to grant independence eventually.

The army was involved in a number of small operations in 1950, when the Republic destroyed the federal structure. In the process it, like Indonesia itself, established a new unity. The most important operation was that undertaken against the South Moluccan rebellion, which was extinguished easily enough apart from a prolonged guerrilla struggle on Ceram island. In addition the Darul Islam rebellion in west Java also was a thorn in its flesh. The army which still contained so many guerrillas was not at all successful in dealing with its problems of guerrilla war. In 1958, it was divided among itself, with much of the army in Sumatra and Sulawesi joining with pro-Western politicians and experts in the PRRI – Permesta rebellion. General Nasution dealt with these swiftly and efficiently, even though they involved air- and sea-borne landings. At the same time it must be added that the rebels showed little appetite for battle and even less tactical skill in preparing to defend airfields or beaches. They had hoped not for a war but for a political deal. But, as in the previous cases, the Permesta guerrillas in Sulawesi held out for several years after the main forces had been destroyed. Not until the Siliwangi had adopted a more socio-political approach, later as we shall see developed into the doctrine of Territorial Management, was it to find a solution to guerrilla war. By 1962 the Darul Islam had at last been eliminated as a result of what across the Straits of Malacca was called a 'hearts and minds' campaign.

By 1960 the Dutch were once more the real enemy and the scene of activities was west New Guinea. The army had little chance to show its ability, however, since the Dutch had sufficient control of sea and air to prevent all but scattered landings. In any case Sukarno relied more on isolating the Dutch diplomatically, and force was threatened and used only so far as it was necessary to jog the USA into a 'mediating' position. It may have been that he had similar intentions when mounting the Confrontation of Malaysia, but it did not work out that way. Britain and Malaysia were not forced into a diplomatic corner. Militarily the Indonesian army was pulled into a campaign it did not want and was not technically equipped to deal with. 1963 and early 1964 showed that the Borneo dissidents trained in Indonesia were ineffective politically and militarily. The weakness of the Indonesian air and naval services prevented any but the most trivial action against the Malaysian peninsula. And so in the latter part of 1964 and throughout 1965, the Indonesian army engaged the British and Malaysian armies in a furtive war along the long frontier between Kalimantan and Sarawak/Sabah. The Indonesians fought competently and bravely, but could not match the experience, particularly of the Gurkha battalions, nor did they have the helicopters or logistic back-up which enabled so few British units to cover such a large territory. By

the time Sukarno was fatally weakened by the Gestapu affair, the TNI recognised that it had been neutralised and was anxious to end the affair.

Since then, there have been actions in 1965–8 to deal with the supporters of Gestapu, with PKI guerrilla activities in north-west Kalimantan and central Java, and the rather more important involvement in Timor. Indonesian units, reputedly volunteers, were landed in Portuguese Timor on December 7th, 1975 after pro-Indonesian parties had called on them for help against the left-wing Fretilin forces which controlled much of the half-island. The Indonesian forces were not well organised and suffered considerable casualties. Ten years of concentration on internal security and the civic mission at the expense of training and preparation for such operations are considered by many to have been an important reason. They did not find it difficult to control the bulk of the half island, but remnants of Fretilin formed guerrilla forces which 2½ years later were still in existence. The army had evidently forgotten the lessons of the early 1960s and lost the abilities they showed during Confrontation, and it has taken 2 years to re-learn them. Both there, and in West Irian to a smaller extent, heavy handed sweeps, burning of villages and similar actions were commonly used, and as usual were counter-productive. A high percentage of combat forces have now had a spell of duty in Timor and combat training has also been increased in the various commands. This is one of the reasons why there is confident talk of the imminent end of the Timor guerrilla war, though West Irian remains a problem, and a more intractable one to which there is no military solution possible, only a political one.

ORGANISATION

A considerable number of army personnel, estimated at about a third of its total strength, are believed to be involved in civil and administrative duties at any given time. Combat forces consist of 14 infantry brigades and two air-borne brigades, together with an armoured cavalry brigade. In addition to this there is an independent tank battalion and seven independent armoured cavalry battalions, together with four independent battalions of para-commandos. Of these, six brigades are under KOSTRAD: three infantry brigades, the armoured cavalry brigade and the two air-borne ones. These are capable of being deployed as two divisions, and while at present they are all stationed in Java, there is talk of some deployment in the outer islands.

The armed forces are organised according to a territorial system. There are four regional commands (originally six) known as KOWILHAN, covering Sumatra and north-west Kalimantan in the case of KOWILHAN I; Java, Madura and Nusa Tenggara (Lesser Sunda Islands) in that of KOWILHAN II; Sulawesi and the remainder of Kalimantan in that of KOWILHAN III; and the Moluccas and west Irian in that of KOWILHAN IV. Army generals command the first three, the fourth being under an Admiral, but each is a combined headquarters. Beneath, there are separate organisations for each service. In the case of the army there are 17 KODAMs (Daerah Military Commands). These are two-brigade strong in the three Java KODAMs and in Jakarta Command and are then headed by major-generals. Elsewhere they are of brigade strength or the equivalent. Beneath them are KOREMs (in Java), KODIMs at district, i.e. *Kabupaten* level and KORAMILs at the sub-district (*kecamatan*) level. These territorial commands, besides being concerned with simple defence matters, are also involved in quasi-political affairs, being responsible for intelligence, internal security and liaison with elected bodies and officials in carrying out the mission of the armed forces. It should be noted that these KODAMs (and in the case of the navy and air force the eight KODAERALS and five KODAVs, respectively) are the highest level at which individual services function separately. Apart from the ordinary Combat Commands there is also KOSTRAD, the Strategic Reserve Command. It was from his position as Head of KOSTRAD that General Suharto was able to organise resistance to the Gestapu plot, and it can be seen as a strike force directly under central command.

The Daerah Military Commands (KODAM) are:

- I Iskandarmuda (Aceh)
- II Bukit Barisan (north Sumatra)
- III 17 Agustus (west Sumatra)
- IV Sriwijaya (south Sumatra)
- V Jaya (Jakarta)
- VI Siliwangi (west Java)
- VII Diponegoro (central Java)
- VIII Brawijaya (east Java)
- IX Mulawarman (east Kalimantan)
- X Lambung Mangkurat (south Kalimantan)
- XI Tambun Bungai (central Kalimantan)
- XII Tanjungpura (west Kalimantan)
- XIII Merdeka (north and central Sulawesi)
- XIV Hasanuddin (south and south-east Sulawesi)
- XV Pattimura (Maluku)
- XVI Udayana (Lesser Sundas)
- XVII Cendrawasih (west Irian)

World Armies

The Fourth Service: The Police

The police are the second largest service in terms of numbers and include a Mobile Brigade. They do not have a territorial organisation as the other services, and are not represented at the KOWILHAN joint service headquarters. The highest level of command is the KOMDAK, of which there are seventeen, coinciding with the KODAM. The police in these are responsible to the Governor of the Daerah, and through him to the Home Minister, and less significantly to the elected Daerah assembly. They wear medium-brown uniforms with similar insignia to those of the army.

RECRUITMENT, TRAINING AND RESERVES

The Indonesian army is essentially a volunteer army. Conscription exists in theory and occasionally specialists such as doctors, engineers and lawyers are conscripted for limited periods. Recruits undergo a basic training of 3–4 months at the regimental centre of the KODAM, followed by a further period of perhaps 4 months of specialist corps training at the appropriate national corps centre. They are then posted to the KODAM for battalion service, and after 1–2 years they rise to the rank of corporal or sergeant, the criterion for promotion being essentially length of service or skill, not leadership qualities. NCOs attend courses and have to pass promotion subjects, and each KODAM has a regimental centre for training, although this is primarily infantry training. The centres are generally well run.

Officers have to pass through the various academies. Entry is highly competitive, and is open only to those who at the age of 18 years have had 12 years of schooling and have the appropriate leaving certificate. The demand for places is so great that it is possible to cream off the most able in society — 100,000 apply each year. There are four academies, of which the most important is the Magelang Academy. It is at one and the same time the Army Academy and the general Academy, and all ABRI cadets spend their first year at the general Academy, only then going on to the specialist (Army, Navy or Air Force) Academies where they study for a further 3 years. They come together again at the end of the course when they graduate as second-lieutenants or the other service equivalents.

Officers serve 2–3 years before promotion as lieutenant, a further 3 years before becoming captains, and then 4 years before achieving the rank of major. Only after achieving that rank is promotion by ability and personal character. Before looking at the Staff College system, it is worth noting that there are two other ways to gain commissions. There is the Officer Candidate School at Bandung which provides a path for NCOs to become officers. This is an extremely tough course, mentally and physically, and lasts 9 months. Candidates have to have reached the rank of sergeant, and so they graduate at about the age of 23 or 24 years. It is an avenue of promotion particularly for administrators and technicians. There is, secondly, professional entry direct from the universities to provide doctors and engineers as required.

Staff College organisation was reshaped in 1974, prior to which there were four Staff Colleges (SESKO). They were brought together under the title of SESKOABRI (Armed Forces Command and Staff Colleges). In practice, however, the services still run their own colleges, to which officers go with the rank of major, but it is necessary to emphasise the Joint Wing Staff College (SESKOGUB). This has a particular significance in that it takes rather more senior officers, at the level of lieutenant-colonel, and it is fairly clear that it is preparing the middle to senior rank officers who have already passed through their own special colleges for their role in civil affairs. No foreign students have so far been admitted to SESKOGUB. Even in the case of the SESKO army course (SESKOADRI), a considerable amount of time is taken up in studying the social background and it is necessary to emphasise the way both military training, and training for the civic mission and for Kekaryaan, are built in to officer training, and increasingly so at the senior levels. In 1974 the Army Staff College was busily preparing its officers for the elections to be held in 1977 and providing them with ideological viewpoints, e.g. a bias against Islam in politics. As noted before it is by no means easy, nor would the Indonesians consider it desirable, to make any fundamental distinction between military training and training for the role in society. It can bring its problems, and some have argued that it has meant that officers are less well prepared to carry out their professional military tasks, a view which many observers of the Timor operation would whole-heartedly endorse.

EQUIPMENT AND ARMS INDUSTRY

Indonesia has a local small-arms industry and manufactures 7.62 mm and 9 mm ammunition. The army's heavy equipment is imported. Most is British, French or Russian, but since the breach with the Soviet Union the Russian equipment is short of spares. It is known that much equipment is out of service but, as there is little current operational need for equipment heavier than small arms, this is not a serious military impediment.

Rifle: 7.62mm BM-59 (Italy; made at Bandung arsenal)

Sub-machine-gun: 9mm PM Model VIII (Indonesia; made at Bandung arsenal)

Machine-gun: 0.30in Madsen (Denmark; made at Bandung arsenal) and 7.62mm DPM and SMG (USSR)

Mortar: 120mm M-43 (USSR; 200 in service)

Anti-armour weapons: 3.5in rocket launcher (USA), 106mm M-40 recoilless rifle (USA) and ENTAC guided missile (France)

Air-defence weapons: 40mm L60/70 Bofors (Sweden; Britain) and 57 mm M-50 gun (USSR; 200 in service)

Artillery: 76mm M-48B-1 pack howitzer (Yugoslavia; 50 in service), 105 mm M-101 howitzer (USA; 40 in service) and 122 mm M-55 gun/howitzer (USSR)

Armour: Ferret scout car (Britain; 55 in service); Saladin armoured car (Britain; 75 in service); Saracen APC (Britain); BTR 40 and BTR 152 (USSR; 130 in service); M-5 Stuart light tank (USA; obsolete), PT-76 light tank (USSR; 75 in service) and AMX-13 light tank (France; 150 in service)

Aircraft: two military transports (C-47s); seven Alouette III helicopters; about 25 light aircraft. The air force operates eight C-130s and 12C-47s, as well as about 55 other transports and observation aircraft

Two further comments must be made about the heavy equipment. While all the armour can be used to control student unrest and for similar internal purposes, the only really serviceable armoured vehicles are the AMX-13s which are being rebuilt and of which about fifty were ready in mid-1978, and 100V-150 wheeled armoured cars mounting either 90mm cannon or twin 30mm machine-guns, which have recently been purchased. The artillery branch suffers desperately from lack of ammunition which prevents proper training of gunners, while poor maintenance in all fields is recognised as a serious problem. The bottleneck here is lack of trained technicians, something of which ADRI is only too conscious.

RANK, DRESS AND DISTINCTIONS

Ranks and Insignia

Working and combat uniforms are of an olive drab colour. The insignia worn by the various ranks are as follows:

General	Four stars
Lieutenant-general	Three stars
Major-general	Two stars
Brigadier-general	One star
Colonel	Three emblems which are a stylised version of a nut
Lieutenant-colonel	Two such emblems
Major	One such emblem
Captain	Three bars
Lieutenant	Two bars
Second-lieutenant	One bar
Candidate officer (equivalent to cadet)	One bar in outline
First assistant lieutenant (equivalent to WO1)	Two zig-zag bars
Second assistant lieutenant (equivalent to WO2)	One zig-zag bar

The above insignia are in yellow metal. In the case of ceremonial and service dress they are worn on epaulettes on both shoulders. On combat uniforms generals wear them on both collar tips, all other commissioned officers and assistant lieutenants wearing them on the right collar tip only.

Sergeant-major	Four yellow chevrons
Chief sergeant	Three yellow chevrons
Sergeant class I	Two yellow chevrons
Sergeant class II	One yellow chevron
Corporal class I	Two red chevrons
Corporal class II	One red chevron
Private class I	Two red bars
Private class II	One red bar

These badges of rank are worn on both arms in all dress, and are of cloth.

CURRENT DEVELOPMENTS

It has been suggested earlier that economic success has not automatically meant the avoidance of conflict, indeed some aspects of the way in which economic growth has been achieved have increased conflict. Members of ABRI, notably those who are involved in economic activities, have been accused of corruption, as indeed have those in a position to place lucrative contracts. Their links with businessmen, particularly Chinese businessmen and with other foreign interests, have

World Armies

been particularly commented on. The Chinese are considered to have made an absolute killing out of *Orba*, and there is also widespread hostility to foreign capital, particularly Japanese and American. Part of the revival of the Sukarno cult comes from those who agree with his former demand to stand on one's own two feet.

There is also a sense in which the army does not really seem confident that economic success does produce unity, and when any criticism occurs, far from taking a relaxed attitude and waiting for economic growth to take care of the problem, it overreacts to it. This could be seen most clearly in January, 1974 when the visit of Prime Minister Tanaka of Japan led to the Malari riots, and, more recently, at the beginning of 1978 when the students demanded that someone other than Suharto should stand for President. Their demonstrations were met by a very heavy-handed response, most notably at the University of Yogyakarta. It is interesting to note that General Dharsono, the former Siliwangi commander, who became the first Secretary-General of ASEAN, lost that position when he came out in favour of the students, accepting their argument that economic disparities had grown under *Orba* and that there was need for action. Dharsono's dismissal was an example of over-reaction, but it is significant that he and those who shared his views to some extent, such as Nasution, were brushed aside without difficulty.

Generally ABRI has managed to handle its crises reasonably well. General Sumitro, who at the time of the Malari riots was Head of KOPKAMTIB (Command for the Restoration of Peace and Order) and whose policy of allowing more open discussion and the expression of differences was considered to have encouraged the violence, was retired with no serious repercussions. And when the affairs of Pertamina led to the need for a stupendous rescue operation to deal with the debts run up by Ibnu Sutowo, Sutowo was removed from his office and replaced with the minimum of disturbance. It has, of course, to be admitted that it did nothing to boost the image of ABRI as the source of infallible and dynamic tycoons. It would be too much to expect 15 years to pass without some differences between leading figures, or the occasional hiccup (even if Pertamina was more of a violent spasm), but it is not apparent that these differences have led to any fundamental divisions within ABRI.

It is frequently asked whether there is a serious division between the old guard, the generation of 1945, and the new Magelang generation, that is to say those who are the products of the academies and do not have the nationalist and political background of their elders — and, if so, what is the difference. The Magelang generation could be expected to be more professional, and there have been rumours of discontent about the handling of Timor amongst them. This generation includes all those up to the rank of colonel and some above, and they must in any case begin to take over the senior positions to a considerable degree in the next few years. It does seem unlikely that the new men will readily abandon the power held by their elders, but the prospect of change gives scope for the most interesting speculation, particularly since it will come as President Suharto draws to the end of his third term.

ACKNOWLEDGEMENT

The writer wishes to acknowledge the help of the Nuffield Foundation in making possible a visit to Indonesia in August, 1978, which enabled him to discuss many of the issues of current importance.

STUART DRUMMOND

IRAN*

HISTORY AND INTRODUCTION

The history of modern Iran since 1921 has been utterly dominated by two powerful and autocratic Shahs, each of whom climbed to a position of total control mainly by means of an intimate alliance with the Iranian army. With the exception of the period 1941–53, during the troubled early years of the present Shah's reign, the relationship between Shah and army has been the key to Iranian politics.

The prestige of the old Persian army, and eventually the larger part of Iran's independence, were destroyed in the course of the nineteenth century by the arrival of Russian and British influence in the area. Russian military power appeared on the Caucasian frontier when the Tsar accepted the Georgian crown in 1800, and in the first major military clash in 1827 the Persian army, though it fought well, was utterly defeated by Russian forces. The treaty of Turkomanчай in 1828 fixed the present Russian–Iranian border, but without the counterweight of British pressure there is little doubt that Russian imperial forces (which also arrived on Iran's north-eastern borders later in the century) would have made further substantial incursions into Persian territory. As it was, the middle and later parts of the nineteenth century in Iran saw a continuous Anglo–Russian struggle for influence which preserved the country's territorial integrity, but virtually extinguished its independence. Central authority steadily diminished, the Persian crown became hopelessly indebted to foreign (mostly Russian) creditors, and the old Persian army ceased to be a serious military force.

The ancestor of the modern Iranian army was the Cossack Brigade, founded by Nasir-ed-Din Shah after he had been impressed by the Cossack guard of honour provided him on his way through the Russian Caucasus during his second European trip in 1878. It was not only trained but also commanded by Russian officers, and was the first military force in Iran to be organised and equipped on European models. By the early twentieth century the old army was in headlong decline, and the Cossack Brigade, plus a gendarmerie trained and commanded by Swedish officers, were the only efficient forces of order available to the Iranian crown. They were far too small, however, to make any impact on the problems of external pressure and internal fragmentation that beset the Persian government.

The first nationalist reaction of a recognisably modern type to Iran's plight was the Constitutional Movement of 1906. Though its motives were mixed and its strategy confused, it was principally an attempt by the tiny handful of educated Iranians to rescue their country from its humiliations by reforming its domestic institutions to make them able to resist foreign pressures more successfully. They drew support from the less articulate anger of the Persian masses against foreign arrogance and domestic decay, but their own programme was typical of such a time and place, putting its faith in the direct transplant of the liberal democratic political institutions of contemporary Europe as a means of restoring Iran's power and prosperity. The Court, traditionalist and despotic, but also bankrupt and militarily helpless, gave in to their demands, and granted a constitution and an elected national assembly (*Majlis*) in October, 1906.

Whatever hope of national regeneration such a programme ever offered, however, was immediately dashed by the Anglo–Russian Entente of 1907. As part of the alliance-making process leading up to World War I, Britain and Russia composed their differences along their imperial borderlands in Asia and thereby ended the rivalry which had been Iran's sole guarantee of independence in the previous 75 years. The two empires agreed to divide Iran into spheres of influence, and northern Iran, including the capital, Tehran, fell into the Russian sphere.

The Russian imperial government rightly regarded the Constitutional Movement as a nationalist threat to its dominant position in its agreed zone of Iran, and immediately began to incite and assist the new Shah in attempts to suppress the *Majlis*. By June, 1908, using the Russian-officered Cossack Brigade as his weapon, he had succeeded, but further turmoil ensued. In July, 1909 Bakhtiyari tribesmen and other revolutionary forces marched on Tehran in defence of the Constitution, defeated the Cossack Brigade outside the city and deposed him (he took refuge in the Russian Embassy), after which the *Majlis* did enjoy nominal control over his 11-year-old son Ahmad Shah. But the revolutionaries soon fell into disagreement, and in 1911 Russian troops were introduced into Iran to overthrow their influence. The northern part of the country remained in virtual Russian military occupation up to 1917.

Iran remained neutral in World War I, though it was inevitably sympathetic to the Central Powers who were fighting its British and Russian tormentors. The government remained a helpless onlooker as Turks and Russians fought repeatedly on its soil, a German equivalent to T.E. Lawrence called Wassmuss raised the Qashqai tribes in revolt against British forces in the province of Fars, and both Britain and Russia raised large forces on its territory. In 1916 the Russians expanded the Cossack Brigade to divisional strength and re-equipped it to fight the Turks, while Britain raised the South Persian Rifles, a mixed British–Indian–Persian force, to control the south of the country.

In early 1917, however, came a stroke of great good fortune for Iran: the revolution in Petrograd. Over the summer of

* See in particular the Addendum entry.

World Armies

1917 the Russian armies in Iran melted away, and with them the semi-colonial status to which the country had been reduced. The Bolsheviks subsequently renounced all the privileges the Tsarist regime had gained in Iran in the Irano-Soviet treaty of 1921 (though Article 6 did give them the right to send troops into the country if it should ever become a base for anti-Soviet activities, and subsequently provided the legal pretext for the 1941 invasion). The only obstacle to Iranian independence still remaining was the British position in the country.

The British government, now free at last from Russian rivalry, concluded a comprehensive agreement with Ahmad Shah in 1919 to consolidate its influence in Iran. There were to be British advisers in the economic and military fields, Britain would monopolise the sale of arms to a new Persian army which it would also help in organising, and there were the usual provisions for a foreign loan. The agreement was kept secret for some time, in knowledge of the storm of nationalist protest which it would unleash. As a first step the Russian officers of the Cossack Brigade were all dismissed in October, 1920 and Persian members of the force (some of whom had been allowed to serve in junior officer ranks) promoted to take their places.

This proved to be the undoing of British plans for Iran, for it led directly to a military coup by the Cossack Brigade less than 5 months later. The storm of protest awakened by the revelation of the British agreement led to several plots by Iranian nationalists against the government, and one of them, headed by a politician called Zia ed-Din Tabatabai, succeeded in gaining the support of the new Persian commander of the Cossack Brigade, Reza Khan. In February, 1921 Reza marched his troops to Tehran and seized power; Tabatabai became Prime Minister, and Reza Minister of War and Commander-in-Chief of all Iranian forces. The agreement with Britain was formally denounced at once.

It is clear that there was an element of military self-interest in this on the part of the newly promoted Persian officers of the Brigade, who understandably disliked the prospect of British officers taking the places of the recently departed Russians. But it is equally clear that Reza Khan, at least, was moved not only by personal ambition but by a powerful sentiment of nationalist resentment against foreign domination.

Reza was then 42 years old, and had spent all his adult life up to that time in the Cossack Brigade. He was a man of modest origins and no formal education, but endowed with immense will and skilled in intrigue. Within a few months he had forced the civilian Tabatabai to flee abroad. By August of 1921 he had more than tripled the military budget (which thus grew to exceed civilian expenditure four-fold). He then embarked on a programme to expand the army (based on the Cossack Brigade) in order to restore central control in outlying parts of Iran, a task which was largely accomplished by 1924.

Reza Khan did not choose to become Prime Minister until 1923, and there was further hesitation (he considered the possibility of a republic) before he forced the abdication of the reigning monarch and had himself declared Shah in 1925, taking the family name Pahlavi for his new dynasty. He ruled Iran for the next 16 years as a total autocrat, brooking no opposition and delegating virtually no authority.

Reza Shah saw himself as a nationalist moderniser in exactly the same tradition as his neighbour Atatürk (the only visit he ever made abroad was to Turkey in 1934), but he was a far less sophisticated man, and Iran was then a much more backward place. The army always came first in his scheme of things, not only because his dominant goal was the creation of an armed force strong enough to maintain internal control and deter foreign aggression, but also because his position was directly dependent on the loyalty of his senior military commanders. He introduced universal conscription and spent heavily to equip the ever-growing army with modern weapons, and even in his projects to improve communications, the educational system, etc. the army's needs got first priority. He changed the titles of military rank from the Turkish of the Zajar dynasty to Iranian (said to be drawn from the Old Persian of the Sassanid period) and emphasised the great military tradition of Iran's distant past. Throughout his reign, the army held the dominant position in all Iranian communities, the civilian authorities in practice being subordinate to the local military commanders.

Under Reza Shah Iran was more unified and tranquil than it had been for over a century, and a certain amount of material progress was achieved, but he grew ever more tyrannical and jealous of opposition. Several hundred political murders may be laid to his account, as he systematically eliminated all possible rivals in political life, and he amassed a vast personal fortune. When the army he had so painstakingly created collapsed after only a couple of days' resistance to the Anglo-Soviet invasion in 1941, his credit with it collapsed. He abdicated, and died in exile in South Africa in 1944.

Iran stayed neutral when war broke out in Europe in 1939, but considerations of trade, anti-Russian sentiment and the Shah's strong anti-Communism inclined the government to be pro-German. When the Soviet Union entered the war in 1941, Iran became the only available year-round route by which supplies could be sent to it from abroad. By that time too, Britain, contemplating the expansion of German influence into the Arab Middle East, had become concerned for the safety of its vital oil-fields in Iran. When Reza Shah failed to comply with the terms of an Anglo-Soviet ultimatum, British and Russian troops invaded on August 26th, 1941. Reza's 22-year-old son Muhammad Reza Pahlavi came to the throne with a shattered army, a country wholly under foreign occupation, and a doubtful future.

The young Shah had no real political experience, having spent 5 years in school in Switzerland and then several years in the Iranian Military Academy, from which he had only recently graduated. He at once freed political prisoners and gave his father's wealth to the nation, in order to strengthen his own precarious position, but for the next 12 years his power remained severely circumscribed by the Constitution (which his father had been able to ignore).

During the wartime occupation successive civilian governments came and went rapidly, unable to contend with the uncontrollable inflation and growing loss of central control. A 1942 Anglo-Russian-Iranian treaty purportedly legitim-

ised the occupation and provided for all foreign troops to be withdrawn within 6 months after the war's end, but the Soviet occupiers exploited their position to foster the growth of a Communist party — Tudeh — and of separatist movements in the areas near the Soviet border. Throughout 1946 they supported 'independent' governments in the Azerbaijani and Kurdish regions of north-western Iran.

Both Shah and army gained considerably in popular prestige from the re-entry of Iranian troops into Azerbaijan in 1946 (though the success had much to do with strong American pressure on the Soviet Union), but mass civilian parties continued to dominate the political scene. A strong Communist movement and an even stronger ultra-nationalist movement alternately competed for power by the most demagogic means, and collaborated against the dominating position of the hated Anglo-Iranian Oil Company which controlled the oilfields. The crisis came when Dr. Muhammad Musaddiq, a radical nationalist, became Prime Minister in April, 1951. Within days he nationalised the oilfields, beginning a two-year crisis with Britain that led to a worldwide boycott against Iranian oil and a rupture of diplomatic relations with London in October, 1952. Musaddiq also became Minister of War in July, 1952 and at once began purging the army of officers he believed loyal to the Shah. Within two months, 25 generals had been dismissed, the Guards Division in Tehran was split into independent units, and plans were made to strip the Shah of his powers as Commander-in-Chief. Both the Shah and his army commanders concluded that the entire existing order was threatened, and so did the United States, which had now replaced Britain as the dominant Western power in Iran.

On August 13th, 1953 the Shah dismissed Musaddiq and named General Fazlullah Zahedi as Prime Minister in his place. At first the stroke miscarried: the Imperial Guard officer who delivered the firman of dismissal to Musaddiq was arrested by forces loyal to the Prime Minister, General Zahedi went into hiding (reputedly in the United States Embassy), and the Shah discreetly fled abroad, his throne apparently lost. But on August 19th General Zahedi led a military coup that overthrew Musaddiq, and became Prime Minister. The Shah returned, and Musaddiq, having been duly court-martialled, went to jail.

It took the founder of the Pahlavi dynasty only 4 years to climb to absolute power with the help of the army; it took his son 20 years, but from August, 1953 the path was smooth. The regime each year quite rightly celebrates the 'momentous' date of August 19th as marking the true beginning of the Shah's rule.

The corresponding enhancement in the army's position was instantaneous (though a massive purge of Tudeh and other pro-Communist members of the army began only a month after the coup, leading to the execution of scores and the imprisonment of hundreds of officers and men). The defence budget, which had been \$43,000,000 and falling in Musaddiq's last year in power, rose steadily to \$144,000,000 in 1965. The army was re-equipped and expanded, offering ample scope for promotion, with the help of substantial amounts of American aid, and an American training mission was attached to it. Political life was also purged by the end of 1954, to the accompaniment of thousands of arrests, and the Majlis subsided into its subsequent state of ceremonial powerlessness.

The latter 1950s were characterised by two trends: Iran's increasing involvement in Western defence arrangements, and the gradual consolidation of the Shah's control over the army. A new oil agreement was reached with Britain and America in 1954, and the following year Iran joined the Baghdad Pact (now CENTO). In March, 1959 a bilateral defence pact was concluded between the United States and Iran, by which the former promised to use appropriate means, including armed force, in the event of aggression against Iran.

Immediately after the 1953 coup there is little doubt that the Shah was directly dependent on the goodwill of his senior army officers, but he at once began to work to extend his control over them, using in particular his control over all senior appointments. By April, 1955 Zahedi resigned as Prime Minister, and the Shah began to take a more active role in the administration. There were attempts by the army to resist this trend — in 1958 General Vali-i Zanani was arrested when a plot was uncovered — but by the early 1960s the Shah's control was virtually complete.

Iranian army officers enjoy very extensive privileges, the armed forces continue to expand, affording rapid promotion, and collectively the officer corps is still the foundation and guarantee of the regime's power. But many senior posts are occupied by officers closely connected with the Royal Family by marriage and/or business interests, and the officer corps as a whole is under close supervision by several competing and highly efficient internal security organisations — SAVAK is merely the best known — which are also engaged in watching each other.

Operating from this base of power, the Shah embarked on a successful campaign to break the power of all the powerful conservative institutions in the land in the early 1960s, in order to clear the way for the rapid modernisation and industrialisation of Iran which was as much his own goal as his father's. The key strategy was the White Revolution (now renamed the Shah-People Revolution), inaugurated in 1962. Its centrepiece was a partial land reform, though it also included such things as a literacy corps of volunteer school-leavers sent out to instruct in the villages (even now illiteracy is 55%). The general tenor of the enterprise was, and remains, a sort of monarchical populism, whose propaganda saturates every area of Iranian public life.

By the middle of the 1960s the Shah's power was virtually untrammelled, and he was able to embark on the ambitious foreign policy and headlong State-directed industrialisation programmes which have characterised the past decade. In March, 1975 the political façade of the regime was adjusted, when the controlled two-party system was abruptly abandoned in favour of a one-party State in which the new Rastakhiz (National Resurgence) Party monopolises political activity. The army continues as the ultimate guarantee of the Shah's power, just as he is the author of its enormous expansion and heightened prestige, but it is a relationship of mutual dependency in which the monarch is now unquestionably the dominant partner.

World Armies

STRENGTH AND BUDGET

The strength of the Iranian armed forces is 413,000, of which 285,000 are army. A large proportion of the army's strength is conscripts, but almost all officers and non-commissioned officers are regulars. The population of Iran is 36,365,000.

The navy has 28,000 men, and the air force 100,000, of whom a smaller proportion are conscripts. They were first organised as branches of the army in 1924 and 1927, respectively, but were elevated into separate services equal in status to the army in 1955. The paramilitary Gendarmerie of 70,000 men, almost all volunteers, is organised on a regimental basis. It is equipped with light aircraft, helicopters and 40 patrol boats.

The revised Iranian military budget for 1977-8 was 562,000,000,000 rials (\$7,900,000,000), just under a quarter of total government expenditure, which actually represented a 24% decrease on the 1975-6 defence expenditure. The latter figure, however, was a 41% increase over the preceding year's budget, and overall Iranian military expenditure has increased approximately ten-fold since 1971. The initial expansion was occasioned by the British withdrawal of military forces from the Persian Gulf in 1971, and the subsequent even more rapid growth was made possible by the five-fold increase in the price Iran has received for its oil since 1973. Military expenditure has remained fairly constant as a proportion of government expenditure, however: since 1971 it has usually taken about a quarter of the budget, thus returning to the pattern of the late 1950s and early 1960s after a temporary decline to around 14% of the budget in the latter years of that decade.

In recent years between 50 and 80% of Iranian military expenditure has been devoted to foreign exchange purchases: since 1972 Iran has bought approximately \$18,200,000,000 of arms from the USA alone. Western inflation, a 15 month freeze on oil prices, and falling oil consumption in the industrial countries brought about the reappearance of a deficit in the Iranian balance of payments in 1976, which accounts for the fall in the 1977-8 defence budget. (It was originally planned to be \$10,550,000,000.) By the end of 1976 Iran was actually pressuring foreign contractors on defence projects and potential suppliers of sophisticated military equipment to accept barter payments in crude oil, with only partial success. The principal effect of the fall in expenditure has been to delay the construction of Iran's extremely large naval and air base at Chah Bahar on the Indian Ocean.

But the long-term ability of Iran to sustain approximately the present pattern of military expenditure is not in doubt, as it represents only about 14% of GNP, which even in 1976 grew at 17%. The implications of this level of expenditure for the eventual scale of Iran's armed forces becomes clear when it is observed that it is equivalent to one-twelfth of the American defence budget, and almost the same as that of France or Britain. The government, moreover, has announced its intention to restore the recent cuts in the defence budget as soon as Iran's income from oil exports rises again: the 1978-9 budget, at \$9,935,000,000, already recovers over half the lost ground.

COMMAND AND CONSTITUTIONAL STATUS

The Shah is Supreme Commander of the Iranian Armed Forces, and is also in direct command of the army corps based in Tehran. He personally approves all senior military appointments in all three services and reviews the lists of lesser ranks. The Royal Family is in the care of the Imperial Guard. The Shah has the power to declare war and conclude peace, and exercises operational control of the forces through the Supreme Commander's Staff, a tri-service joint staff organisation. He takes a close personal interest in all military affairs.

The three services are partly integrated under the Ministry of Defence, whose Head, as in the case of other Ministers and the Prime Minister, is appointed by the Shah. The Ministry of Defence is primarily concerned with legislative, budget and fiscal matters, and the Minister (currently General Reza Azimi) is not in the chain of command.

A committee at the highest government level meets on national security matters, but its organisation is informal and its meetings *ad hoc*. The chain of command runs directly from the Shah to the Chief of the Supreme Commander's Staff, the senior officer of the armed services and usually a full general. His office includes a vice-chief and staffs for personnel, intelligence, operations, logistics, plans, communications and fiscal matters (comptroller).

Operational control passes directly from this staff to the chiefs of the three services, who do not themselves have any joint organisation or authority although they meet frequently on service matters.

The army predominates in the joint staff organisation, and in the armed forces as a whole.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

The Iranian army has three principal roles in external policy, corresponding to the three main threats to Iran's security perceived by the Shah. In approximate order of importance, these latter are: the 1100 mile border with the Soviet Union; the lengthy frontier with the radical Iraqi regime, which has repeatedly come near to conflict with Iran; and the stability of the small Arab shajhdoms on the southern side of the Persian Gulf, which potentially dominate the vulnerable sea route along which almost all Iran's trade, including oil exports, must travel.

The corresponding military tasks are: to maintain at least a minimum deterrent force against a Soviet attack; to establish

and maintain military superiority over Iraq; and to maintain a quick-reaction intervention force for use in the Gulf. In accord with these priorities, the three main Iranian army headquarters are located at: Tehran, controlling forces on the Soviet border; Kermanshah, controlling those on the Iraqi border; and Shiraz facing the Gulf.

Lesser or at least less-urgent duties falling on the armed forces include counter-insurgency operations against the dormant Baluchi separatist movement in the barren south-east, the creation of a degree of Iranian air and maritime superiority in the western Indian Ocean and the maintenance of an overall military balance with the rapidly expanding forces of Saudi Arabia. There are no perceived security threats along the Pakistan or Turkish frontiers.

The April, 1978 coup which brought a leftist, pro-Moscow government to power in Afghanistan has reportedly occasioned a limited increase in the forces deployed in Iran's sparsely populated north-east along the Afghan border. Tehran's anxieties, however, centre much more on the possible destabilisation and disintegration of Pakistan due to Afghan intrigues, and on the presence of about a million Afghan immigrant workers in Iran, than on the unlikely contingency of a direct military confrontation with Afghanistan.

Though the Soviet threat to Iranian security is potentially far more serious than any other, relations with Moscow have been consistently good since the Shah first visited the Russian capital in 1965. The volume of Russo-Iranian trade is quite large, and Tehran has even bought a considerable quantity of arms from the Soviet Union. But the Russians have invaded Iran three times in this century, and if the Penkovsky papers are to be believed they had contingency plans to try it again as late as the Cuban missile crisis of 1962. However firm the American defence guarantee may seem at the moment, moreover, the Shah seems conscious of the possibility that American political will could conceivably be weakened at a critical moment in the future by some domestic preoccupation or foreign fiasco.

As a consequence, he views the present deployment of considerable Iranian armed forces facing the Soviet frontier not as an impenetrable defence — which it certainly is not — but as a trip wire ('a lock in the door', he calls it) which would hold up a Russian invasion long enough for the West to demonstrate its determination to defend Iran and its oil. For the more distant future, when Iranian armed forces will be much larger, it is possible that he foresees an independent Iranian deterrent.

When Iran's present and already planned arms orders will have been delivered, less than a decade from now, the country may dispose of up to 3500 tanks and approximately 1000 ultra-modern combat aircraft, with other weapons and defensive systems on a similar scale and level of sophistication. Such armed forces do not compare with the Soviet Union's, of course, but they would be roughly equivalent to the present West German armed forces — questions of combat efficiency aside — and would certainly require an extremely large commitment of Russian forces to overcome them.

The great bulk of the Soviet armed forces are presently deployed facing NATO in Europe and China in the Far East, and it is a reasonable assumption that they will become increasingly stretched as Chinese military capabilities improve. The question then arises: could the Soviet Union possibly withdraw forces on the scale required for many months from either or both of these major fronts, in order to invade or merely blackmail Iran? It is arguable that a credible conventional deterrent against Soviet invasion is potentially available to Iran in the next decade.

The second (and generally more evident) Iranian defence priority is Iraq. The two countries nearly went to war over the Shatt-al-Arab dispute in 1969, and again over Iranian support for Kurdish rebels in the north of Iraq in 1974-5. The regimes in Baghdad and Tehran cordially loathe each other, and there has been repeated Iraqi involvement in plots against the Shah. Iraq is itself an unusually well-armed country, with an army and air force that at the moment are not gravely inferior to Iran's (although the gap is steadily widening as Iran's new arms arrive).

The most sensitive issue between the two countries for many years was the Shatt-al-Arab, the waterway by which the combined Tigris and Euphrates rivers reach the Persian Gulf. The Shatt is the avenue by which all Iran's oil reaches the sea, but by a treaty imposed by the British in Iraq earlier in the century the international border ran not down the middle, but along the Iranian shore. This gave Iraq a potential stranglehold on Iran's trade lifeline.

In 1969 Iran re-opened the question of the border in the Shatt, and for the next 6 years relations between the two countries were extremely tense. Occasional border clashes and mutual expulsions of minority populations were followed in 1974 by large-scale Iranian logistical support for the Kurdish separatists fighting in the north of Iraq. Not only did Tehran allow the Kurdish insurgents free movement across the border areas in their control; it also reportedly supplied them with artillery and anti-aircraft weapons. It was a potentially risky strategy, for Iran has a much more numerous Kurdish minority on its own side of the border, but it worked. By late 1974 the larger part of the Iraqi army was tied down by the relentless Kurdish war in the northern provinces, and the overstretched Baghdad regime came to terms. In early 1975 it agreed to redraw the international boundary down the centre of the Shatt-al-Arab. In return Iran dropped all support for the Kurdish revolt and closed the border, whereupon Kurdish resistance in Iraq promptly collapsed.

It was a major victory for Iran, and was due at least in large part to the fact that Iraq did not dare escalate the conflict into an open clash with Iran's growing armed forces. The same consideration of the Iranian military deterrent undoubtedly plays a large role in discouraging Iraq from more energetic attempts to export revolution to the Arab shajhdoms of the Gulf. For this reason alone, Iran will continue to maintain large forces capable of striking Iraq — though of course these can be largely the same forces which Tehran maintains for security against the Soviet Union.

The third Iranian defence priority is the stability of the Persian Gulf. In 1974 the Shah described the Gulf as Iran's 'jugular vein', and stressed that Iran could not survive, and therefore would not tolerate, the presence of 'any forces of subversion, destruction, chaos and murder which might come close to the entrance to the Gulf'. This means, in effect, an Iranian

World Armies

commitment to the survival of the various shaikhly regimes in the Gulf mini-States stretching from Kuwait to Oman, and an ability to intervene in their defence (even against internal disorder) if necessary.

This task does not require large forces — the population of the whole Gulf coast from Kuwait to Oman is only about 3,000,000, of whom around half are foreign workers — and there is little question of the Iranian ability to intervene rapidly in any of these States. Iranian forces capable of doing the job are in place and adequately equipped. Such intervention, even upon invitation, would raise some very delicate political questions, however, for Iran is a non-Arab State and the Arabs are extremely sensitive about what they suspect to be Iranian ambitions in the Gulf. Saudi Arabia, in particular, is building up large armed forces with great haste, partly in order to counter-balance what it sees as a suspicious superabundance of Iranian military power in the area.

There can be no doubt about Iranian determination to use military force, if necessary, to ensure the stability of conservative Gulf regimes and to safeguard its maritime communications in the area. It began building up its forces in the south as soon as Britain's departure from the Gulf was announced in January, 1968. It also revived its dormant claim to the Greater and Lesser Tunbs, small islands lying athwart the narrow Strait of Hormuz which gives access from the Gulf to the Indian Ocean. They had long been administered by the shaikhdom of Ras-al-Khaimah (now part of the United Arab Emirates), but when the latter refused to relinquish them it launched a small-scale invasion in December, 1971, took them over, and expelled the Arab population. The islands have since been developed as military bases commanding the Hormuz Strait.

Iran's sensitivity is even more clearly shown by its role in the Dhofar war in Oman. The rebellion in the southern province of Dhofar, along the South Yemeni border, had progressed so far by 1970 that little of the province outside the capital town remained in Omani government hands. The rebels by that time were avowed Marxists, and belonged to an umbrella organisation called the Popular Front for the Liberation of Oman and the Arab Gulf (PFLOAG), receiving Chinese, South Yemeni and Iraqi support, which was attempting to create revolutionary cells even in the petty oil States west of Oman along the southern side of the Gulf. The threat to Oman itself would have been sufficient to motivate an Iranian involvement, however, for that State controls the tip of the peninsula jutting northwards to create the Strait of Hormuz, through which one oil tanker passes every 11 minutes. Indeed, two of the three deep-water tanker channels by which Iranian oil leaves the Gulf pass through Omani territorial waters.

In 1973, therefore, Iran guaranteed Oman's airspace, stationed IAF fighter-bombers in Dhofar, and in December dispatched an expeditionary force consisting of a fully equipped 3500-man brigade to Dhofar to strengthen the Sultan's hard-pressed forces there. Arab States made vocal and bitter protests, but none actually did anything. (Some, at least, were secretly grateful.) In the following 2 years the Iranian forces contributed about half the actual combat troops in Dhofar, and made it possible at last for government forces to go over to the offensive. Their performance revealed some glaring deficiencies in Iranian command organisation and tactical training, but they unquestionably turned the balance. By the end of 1975, Iranian navy destroyers were running fire-support missions along the coast, and on at least one occasion Iranian aircraft attacked the South Yemeni supply centre of Hauf across the border. By the end of 1975, Dhofar had been largely cleared of rebel forces, and on December 11th the Sultan of Oman declared the war won. Iranian casualties were not revealed, but amounted to several hundred.

At the end of January, 1977 it was announced that the Iranian expeditionary force would be gradually withdrawn from Oman, and at the end of the year it was down to about 1000 men. The two States remain very close allies, and Iranian influence predominates in Oman despite extremely large amounts of Saudi Arabian financial aid in the past few years. Air bases in Oman are certainly available for Iranian use, which greatly extends the range of Iranian air cover over the Indian Ocean, and the two allies issued a communique in December, 1977 stating that they would be jointly responsible for the security of the Straits of Hormuz.

The Dhofar incident might thus be taken as a measure both of Iranian determination to preserve the present regimes on the opposite side of the Gulf, and also of the extent of Arab tolerance for such Iranian initiatives. It is by no means certain, however, that such tolerance would be extended by either the Saudis or the Iraqis to a similar incident occurring further west, inside the Gulf itself. The State that causes the most concern in this region is Bahrain, where there is a very large settled Iranian community whose safety could become either the cause or the pretext for Iranian intervention in the event of internal disorders. Bahrain attempts to maintain a balance between its two big neighbours: a Saudi Arabian air base has recently been constructed on the island, but there is a reported agreement whereby Bahrain also accords facilities to the Iranian navy and air force. Another arena of Iranian-Saudi rivalry is the United Arab Emirates: Saudi influence predominates in Abu Dhabi and the smaller emirates, but Iran has extensive links with Dubai, where the majority of the large merchant class is Iranian. During the crisis in early 1978 over the merging of the emirates' armed forces, Iran tacitly supported the claim of the Dubai contender (the son of the shaikh) for the post of Commander-in-Chief against the successful Saudi-backed candidate, the son of the Shaikh of Abu Dhabi.

There are certain further Iranian defence commitments beyond these high priorities. One is certainly the suppression of subversion (i.e. separatism) in Baluchistan. Iran maintains a very close watch on such activities within its own frontiers, and has helped Pakistan to subdue an outbreak of separatist insurgency in its neighbouring portion of Baluchistan over the past few years. Twenty-five Iranian Chinook helicopters with pilots were lent to Pakistan at the height of counter-insurgency operations there in 1974, and in recent years Iran has actually been providing larger amounts of development aid for the Baluchistan province than Islamabad itself. The problem would only be likely to become acute, however, in the

event of a further disintegration of the State of Pakistan, which the Shah has stated would elicit 'some kind of protective reaction in Baluchistan' by Tehran. The seizure of power in Afghanistan by pro-Moscow leftist officers and civilians has revived the Iranian nightmare of a Soviet-controlled corridor down to the Indian Ocean through Pakistan's North-West Frontier Province and Baluchistan, especially as the Kabul government has shown early signs of renewing the Afghan support for secessionist movements in those Pakistani provinces which was ended by the previous government in 1975.

Iran has also displayed a degree of anxiety over the growing presence of the Soviet navy in the western Indian Ocean, through which its oil and most of its imports must pass. For this reason it has begun to build-up an ocean-going navy (four extremely sophisticated destroyers and three submarines are currently on order from the USA), and to build-up a strategic naval and air base at Chat Bahar on its south-east coast, on the open Indian Ocean. Iran has also bought 15 jet tankers for in-flight refuelling, in order to extend the range of its combat aircraft to cover the entire north-west quarter of the Indian Ocean, and has a number of long-range maritime reconnaissance aircraft on order.

The rapid growth of the Soviet-Cuban military presence in the Horn of Africa in 1977-8 has stimulated a much more direct Iranian political and military involvement in this area as well. It is in this region that Iranian and Saudi Arabian activities most closely coincide, though they are not co-ordinated. Thus it was Saudi Arabia which gave Somalia a very large sum in financial aid (said to be \$400,000,000) in return for the expulsion of Soviet advisers, and subsequently gave a further \$200,000,000 for arms purchases during Somalia's ill-fated invasion of Soviet-allied Ethiopia during 1977-8. But it was Iran which provided actual arms aid (to the extent that the United States' controls on third-party arms transfers permitted), and Iran, with its far more mobile armed forces, which extended the offer of direct military support if Ethiopian and Cuban forces had attempted to follow the retreating Somali army across the frontier in the spring of 1978.

Iran's concern for the security of the Red Sea also led it to help North Yemen build a military base south of Mokha and to supply it with arms and spare parts when Soviet supplies dried up. It is believed that Iran was given facilities at the Mokha base in return, but it is not known whether these have been continued since the assassination of North Yemeni President Ibrahim al-Hamdi in October, 1977, and his replacement by a more pro-Saudi officer. There has also been much Iranian diplomatic and financial support for Egypt since 1976, and there have reportedly been talks on the establishment of Iranian naval bases at Port Said and Suez.

There are 391 Iranian troops attached to the UNDOF contingent in Syria, some of whom have been detached to serve with the UNIFIL contingent in southern Lebanon.

ORGANISATION

Arms of Service

The army consists of three armoured divisions, four infantry divisions and four independent brigades (two infantry, one airborne and one special force). Air defence is provided by a SAM battalion equipped with Hawk missiles and there is a separate Army Aviation Command.

The principal arms are infantry, armour and artillery, but there are also separate specialities for engineers, aviation, paratroops, alpine troops, anti-aircraft troops, and even horse cavalry. Supply services are controlled by Logistics Support Command, one of the largest organisations in the army, which is also responsible for carrying out almost all of the construction work and base maintenance required by the army.

Operational

There are three field armies: The First Army, with headquarters in Kermanshah; the Second Army, headquarters Tehran; and the Third Army, headquarters Shiraz. The Imperial Guard is separate. Army Aviation Command has its headquarters at Isfahan.

Imperial Iranian Navy headquarters are at Khorramshahr, the major naval base. Other bases are at Bandar Pahlavi (on the Caspian Sea, where only patrol boats are maintained), Bushire, Kharg Island and Bandar Abbas, while a large new base for Indian Ocean operations is being built at Chah Bahar near the Pakistani border. The navy also controls a squadron of six maritime reconnaissance aircraft, an anti-submarine warfare squadron of six helicopters, a transport squadron of 10 aircraft and 48 helicopters, and three marine battalions.

The Imperial Iranian Air Force is organised into 10 fighter-bomber squadrons, 10 fighter-ground-attack squadrons, two fighter squadrons (with F-14A Tomcats), one reconnaissance squadron, four medium transport squadrons, four light transport squadrons, and one tanker squadron. Air force headquarters are in Tehran, and other major air bases are at Ahwaz, Dezful, Doshan-Tapeh, Gah-Marghi, Hamadan, Isfahan (the principal training centre), Mashhad, Mehrabad, Shiraz, Tabriz and Zahidan.

In view of the rapid growth of the Iranian armed forces, all these figures are liable to change quickly.

World Armies

RECRUITMENT, TRAINING AND RESERVES

Basic military manpower is provided by universal conscription at the age of twenty-one, for a period of 2 years. Graduates of secondary schools and universities serve for shorter periods, having already received military training in these educational establishments, and are usually granted commissions: first-lieutenant for those with doctorates, second-lieutenant for those with bachelor's degrees and third-lieutenant for high-school graduates. Exemptions are generally available for those who are the sole support of their families, and for students until they have completed their educations. Former employers are obliged by law to offer discharged conscripts a job at least equal to that that they last held before entering military service.

Recruits receive 13 weeks' basic training at one of six induction centres, and are then assigned to organisations for unit and advanced training. All conscripts are required to learn to read and write before being discharged, adequate instruction being provided, and many learn a trade as part of their service duties or through special instruction in the last 3 months of their service. The manpower available considerably exceeds military requirements, and large numbers of suitably qualified men are instead directed into the various community assistance organisations — the Literacy Corps, Development and Agricultural Extension Corps, Health Corps and Equity Corps (legal aid) — or into the gendarmerie, to serve the equivalent of their military obligation.

The bulk of the officers and NCOs are regulars. Regular officers are commissioned after a 3 year course at the Military College, which is open to secondary-school graduates possessing character references from a general officer or a member of parliament, and who pass a competitive entrance examination. They are subsequently trained in combat tactics at the training centres run by the different branches of the army, which also provide officers and NCOs with advanced courses in their specialties. An annual field-training cycle provides unit training and regimental and divisional exercises; occasionally there are also combined war games with the forces of other CENTO member nations.

Higher military education is provided by the Army Staff College and the War Academy. The National Defence University, founded in 1968, amalgamated the high command, joint staff and senior management schools. Iran's armed forces are largely self-sufficient in military education, though numbers of senior officers attend foreign staff colleges for the usual purpose of keeping abreast of military thinking elsewhere. There are, however, very large and increasing numbers of officers and men who are sent abroad for training in various advanced technical subjects.

Increasingly the key problem of the Iranian armed forces is the competition of the technology-laden armed forces and the civilian sectors of Iran's rapidly growing industrial economy for the same severely limited pool of educated and skilled manpower. (One of the ways in which the air force attempts to deal with this problem is by the creation of a special category of enlisted men called *homafars*, who serve for at least 11 years after being taught to maintain and service Iran's sophisticated combat air force on technical training courses in the USA.) The inevitable shortfall in skilled military manpower has taken its toll on the general level of efficiency, and expensive equipment is sometimes ill-maintained.

One Iranian remedy for this problem has been increasingly to insist that the suppliers of major weapons systems make provisions for training Iranians in their maintenance. In the case of the USA, which has furnished the bulk of Iran's weapons purchases, this has given rise to a considerable degree of concern. The United States Senate Foreign Relations Committee forecast in mid-1976 that 50,000–60,000 American military and civilian technicians, if not more, would be needed by 1980 to help maintain and operate even the military equipment that Iran had already ordered. (The 1977 figure was already over 30,000–40,000 United States technicians in maintenance shops and on airfields.) Iran, it concluded, could not go to war 'without United States support on a day-to-day basis', and it voiced its anxiety that the USA might thus be dragged into a war not its own. Iran has responded by warning that any United States restrictions on arms sales would simply cause it to take its trade elsewhere.

Iran has used this tactic before, to great effect, when faced with a general American embargo on the sale of advanced weapons to the Middle East in the mid-1960s. In 1967 it concluded a \$100,000,000 deal with the Soviet Union to buy tanks, APCs and anti-aircraft weapons. As a result, American reluctance to sell advanced weapons to Iran magically disappeared.

Nevertheless, the political problems of being dependent on foreign technicians will certainly continue to trouble Iran for some time. So long as expansion continues at the present rate, there is no reasonable prospect that Iran will be able to catch up and supply the skilled manpower to maintain its weapons from its own resources. The more general problem of controlling the logistics of such complex and sophisticated forces has also posed a major difficulty, and in November, 1976 the USA and Iran signed a \$191,000,000 contract under which Lockheed technicians would create a new logistics system and train Iranians to operate it.

Iranian army reserves are officially stated to be 300,000 men, but probably exceed 500,000. The Military Service Law of 1969 requires men to serve in the reserve for a total of 40 years, but not beyond the age of sixty. The service is broken into five periods: 2 years of active service; 6 years in the active reserve; and three further periods of 8 years, 9 years, and whatever years remain to the age of sixty. During the active reserve period they are required to train for 30 days a year, although this provision is not always enforced. Reserve officers generally go through the college military training systems, and then receive 6 months of intensive training at one of the major branch centres — infantry, armour or artillery — at the beginning of their active service.

The principal paramilitary force is the Imperial Iranian Gendarmerie, numbering 70,000 men with light aircraft, helicopters and 40 patrol boats. The structure is military, and the officers come from the army; the great majority of the

enlisted ranks also began their service in the army. The gendarmerie is responsible for security in rural areas and towns of under 5000 people, and provides the country's border guard. In peacetime it is under the control of the Ministry of the Interior, although it co-operates closely with the army in controlling internal disturbances. In wartime it would come under army direction; some specialised groups are capable of combat duty, but its primary mission would be rear-area security.

EQUIPMENT AND ARMS INDUSTRY

In mid-1978 the Iranian army's armoured strength consisted of 760 Chieftain, 400 M-47/48 and 460 M-60A1 medium tanks and 250 Scorpion light tanks. The infantry is partly mechanised, using about 2000 M-113 and BTR-40/50/60/152 APCs. Artillery strength comprises about 650 guns and howitzers, including: 330 105 mm and 100 155 mm; various numbers of 75 mm, 130 mm and 175 mm SPs; and 203 mm SPs of American and Soviet manufacture. Lighter fire-support weapons include M-21 RLs and 106 mm RCLs.

Anti-tank missiles are a mixture of ENTACs, SS-11s and TOWs. There are 650 anti-aircraft weapons, mainly Russian built, including 23 mm (20 SP), 35 mm, 40 mm, 57 mm (80 SP), 85 mm and ZSU-2.3-4 and ZSU-57-2 SP guns, and Hawk surface-to-air missiles.

Army Aviation Command disposes of 69 light aircraft and 332 helicopters. The types are: 3F-27, 5 Shrike Commander, 45 Cessna 185, 10 O-2A and six Cessna 310 aircraft; and 120 AH-1J, 100 Bell 214A, 20 Huskie, 52 AB-205A and 40 CH-47C helicopters.

The navy possesses three destroyers armed with Seacat or Standard SAMs, and four frigates with MK 2 Seakiller SSMs and Seacat SAMs. There are also four corvettes, five minesweepers, four landing craft, two logistic support ships and 14 hovercraft. The Naval Air Arm has six P-3F Orion maritime reconnaissance aircraft, six S-65A anti-submarine helicopters, a transport squadron with six Shrike Commanders and four F-27s, and 48 helicopters (five AB-205As, 14 AB-206As, six AS-212s, 20 SH-3Ds and three RH-53Ds).

The air force has 189 F-4 D/E/RF-4E Phantoms, with Sidewinder and Sparrow air-to-air missiles and Maverick air-to-surface missiles, 112 F-5A/Es and 40 F-14A Tomcats. Transport and tanker strength is 57 C-130 E/Hs, 10 Boeing 707s and five Boeing 747s. Light transport aircraft include 23 F-27s, three Aero Commander 690s and four Falcon 20s. There are 48 helicopters: 10 Huskies, six AB-205s, four AB-206As, five AN-212s, five Bell 214Cs, two CH-47Cs and 16 Super Frelons. The 57 training aircraft include 15 F-5B/Fs, nine T-33s and 30 Bonanza F33A/Cs.

These are impressive forces, but they amount to a total considerably less than the new weapons Iran now has on order. These include a further 1220 Chieftain tanks (with the new Chobham armour) and a base workshop for their maintenance, 110 Scorpion light tanks, 240 Vickers armoured recovery vehicles, 1000 tank transporters and a complete modernisation programme for its present M-47/48 and M-60 tanks. On usual calculations this adds up to another three or four armoured divisions.

Other army equipment is being expanded at a corresponding rate. Large amounts of Dragon and TOW anti-tank guided weapons are on order from the USA, and ASU-85 SP ATKs from the Soviet Union. Soviet ZSU-23-4 radar-controlled automatic anti-aircraft cannon, SA-7/9 SAMs, six batteries of American-built improved Hawk SAMs and British-made Rapier surface-to-air missiles (the latter is a \$700,000,000 order) on tracked vehicles are being acquired for air defence, and a variety of other items include Fox scout cars, BMP MICVs and some 6000 Land Rovers. Army Aviation Command has 193 Bell 214A and 82 AH-1J helicopters on order, and there are plans to build further Bell helicopters in Iran.

Known naval orders include three used Tang-class submarines (to be delivered in 1978) and four Spruance-class destroyers (at over \$350,000,000 each, for delivery in the early 1980s), 12 fast patrol boats armed with Exocet surface-to-surface missiles, four naval supply vessels, two landing craft, three RH-53D helicopters and a further three P-3 Orion maritime reconnaissance aircraft. Iran is now on the verge of launching a further naval expansion programme to double the size of its fleet, in order to expand its presence in the Indian Ocean, at an estimated cost of \$500,000,000. In early 1978 it was nearing agreement with West Germany and other European countries on a \$3,500,000,000 purchase involving six 209-class submarines, a dozen F 122-class frigates, at least eight minesweepers and possibly some patrol boats. Further orders for 10 more West German submarines and additional minesweepers and torpedo boats are expected to follow. The Shah has stated that his new naval acquisitions are not directed towards the Gulf, but rather are intended to give Iran a true blue-water capability in the Indian Ocean (where Iranian naval patrols already extend over 1000 miles from its coast). The new programme will leave only India as a potential naval rival in the Indian Ocean.

Most expensive of all is the programme for the expansion of the air force. Forty further Phantoms and another 69 F-5s are on order, to bring the total of these aircraft to 229 and 181, respectively, while an additional 40 F-14A Tomcats to be delivered over the next few years will bring Iran's total of these ultra-modern aircraft to 80. Iran has also agreed to buy 160 F-16 fighters from General Dynamics for \$3,200,000,000, the purchase receiving final Congressional approval in late 1977; first deliveries will be in 1980. Iran has also expressed a strong interest in buying 250 F-18Ls from Northrop as eventual replacements for its F-4s — it even offered to contribute to Northrop's development costs, as it has previously done for Bell's helicopters and Grumman's F-14 — but President Carter finally denied the request in late 1977. Iran has now announced that it will be seeking another 140 F-16s, for a total of 300, and an additional 76 F-14As, for a total of 156. It also

World Armies

wishes to purchase another 31 F-4 Phantoms to replace those lost in training and military exercises. The Shah has warned that he might buy French or other European aircraft instead if these requests are turned down.

Besides combat aircraft, the Iranian air force has four more 747 jumbo jets and one Boeing 707-320C tanker on order, as well as two F-27 transports and 19 Bonanza trainers. It was reported in late 1977 that Iran would be seeking to buy up to 100 C-130 and/or other medium transport aircraft. Its helicopter orders include 50 CH-47s, two AS-61As and 38 Bell 214Cs. It possesses five SAM squadrons with Rapier and 25 Tigercat surface-to-air missiles, and is purchasing Blindfire SAM radars from Britain. These weapons plus the army's Hawk SAMs will constitute an integrated national air-defence system. 350 Sidewinder, 350 Sparrow and 424 of the very-long-range Phoenix air-to-air missiles are on order. There have been negotiations with Rockwell International to buy Project Ixex, a sophisticated electronic intelligence network. Iran is buying seven of Boeing's E3A aircraft for airborne early warning and control (AWACS), at a total programme cost of \$1,200,000,000, and is understood to have an eventual requirement for three more. They will be deployed in conjunction with 12 Westinghouse ADS-4 ground radars already in Iran; the total system is expected to be operational in 1984.

It is scarcely surprising, with such a huge consumption of arms, that Iran should seek to establish its own arms industry. The Iranian Military Industries Organisation has the ability to manufacture small arms and minor military equipment and to carry out repair and maintenance work on tanks and infantry weaponry, and has begun the establishment of a military-industrial complex at Shiraz. In the initial phase this is to make spares and ammunition for the Chieftain tank, and to repair weapons-guidance systems. Iran is also constructing an ordnance factory at Isfahan, with British assistance, at a cost of at least \$1,500,000,000. The project will take until 1983-4 to complete.

Bell Helicopters Textron has won an international competition to establish a helicopter industry in Iran with provision for the co-production of 400 AB-214A helicopters (in addition to those now being built for Iran in Fort Worth). Bell will furnish tooling and production parts to the value of \$125,000,000, and run a training programme to prepare Iranian personnel to operate and manage Iran's helicopter industry. Iran Aircraft Industries, which is jointly owned by Iran and the Northrop Corporation, is already engaged in repair and maintenance work on air force aircraft, and carries out some sub-contract production for United States firms; one of its main purposes is the training of Iranians to handle aerospace technology. Iran Electronic Industries is becoming involved in the manufacture of military electronic equipment.

Immense difficulties lie in the way of establishing a comprehensive and self-sufficient Iranian armaments industry. Iranian industrial infrastructure is inadequate to sustain anything beyond final assembly and repair work for the moment, so far as complex weapon systems are concerned and an even more critical factor is the acute scarcity of Iranian production engineers and skilled workmen to staff such an ambitious venture. Thus, while Iran may be able by the early 1980s to produce much of its own ammunition and spares, to provide base maintenance, to maintain and repair its own aircraft and electronic equipment, and to build small warships, it will probably remain dependent on foreign sources for its more complex weapon systems for a good deal longer.

RANK, DRESS AND DISTINCTIONS

Iranian rank structure is conventional, except for the rank of third-lieutenant conferred on those who receive a regular commission without attending the Military College, or a reserve commission without a bachelor's degree. Promotion is based on time in grade, efficiency reports, completion of prescribed courses and occupation of a military position commensurate with rank; a security check is usual before promotion, and all officer promotions must be approved by the Shah. The size of the officer corps is fixed at 10% of armed forces strength.

Pay, allowances and other benefits for both officers and men add up to a scale of remuneration which compares favourably with civilian wage rates. Retirement on pension is voluntary for officers after 20 years of service, and mandatory thereafter when they reach a specified age in grade. NCOs with over 20 years of service are retired at the age of forty-eight. Monthly retirement pay is computed at one-thirtieth of the last monthly active-duty pay multiplied by the number of years of service to a maximum of thirty; two-thirds of that amount devolves as a pension to dependent heirs of deceased retired officers.

The standard Iranian army uniform is a short khaki jacket with brass buttons, khaki trousers and either garrison or field cap; officers' uniform differs little except in distinctive cap insignia and rank insignia. A woollen winter uniform is worn for one season only in the colder parts of the country. There are a variety of functional uniforms for special duties — armoured troops, flying personnel, ski troops, etc. — and special ceremonial uniforms of a more traditional design. Officers' dress uniforms are ornate with capes, swords, epaulettes, tassels and gold belts.

Air force uniforms are similar to the army except that they are blue in winter and have light-blue caps and belts in summer. Naval uniforms for officers and men conform to the usual naval patterns.

The highest military decoration for gallantry under fire is the Order of Zolfaghar; it is awarded to both officers and men, and carries an annual cash payment. Ribbons have three black and two blue vertical stripes. The Order of Sepah (officers and men — red with narrow white margins), the Order of Liah Ghat (officers only — blue with red borders) and the Order of Eftakhar (officers only — four white and five black vertical stripes) are awarded for meritorious service, efficiency and initiative; the latter may also be a decoration for courage in wartime. The Gold Medal, worn with green and red ribbon, is awarded to officers who have distinguished themselves in combat.

Other military decorations worn by officers include: the Decoration of the Third of Isfand (three red and two black stripes) which was awarded to officers who took part in the 1921 *coup d'état*, carries a lifetime annuity, and is hereditary; the Order of Rastakhiz (wide white stripe bordered on each side by black—red—black stripes), awarded to military personnel who supported the Shah in the overthrow of Musaddiq in 1953; and the Decoration of Intellectual Achievement.

CURRENT DEVELOPMENTS

The most pressing questions about the Iranian armed forces clearly are: is their extremely rapid expansion justifiable in terms of defence alone; will they remain a stabilising political influence in the State in the foreseeable future; and if they did have to fight, would their performance be as impressive as their weaponry?

Iran's armed forces inevitably attract much attention, as the largest spenders on modern military equipment outside the circle of the major industrial powers. The rapidity with which they have achieved that distinction since 1971 serves to intensify speculation. But Iran does live in a very dangerous part of the world: it borders directly on the Soviet Union, it is the one non-Arab oil State in the Middle East, and its neighbours across the Gulf — the lifeline of its prosperity — sometimes seem distinctly fragile politically. To some extent, it could be said that any State in such a position would naturally seek large armed forces. What distinguishes Iran is that, unlike most States so unfortunately situated, it has enough wealth actually to acquire them.

There are other factors too, of course. The Shah is undoubtedly a man with a deep personal fascination for military affairs, and takes a more consistent and direct interest in his military forces than in any other aspect of the State. There is, even now, a certain insurance value to be had from providing Iran's officer corps with ever larger forces, interesting new jobs and pieces of equipment, and good promotion prospects, as a means of keeping them satisfied and politically loyal.

There is also a great deal of diplomatic influence to be had from the possession of impressive armed forces, and it is most probably in this context that the Shah's frequently reiterated intention to turn Iran into one of the world's major non-nuclear military powers should be viewed. Like his ambitious goal that Iran should join the ranks of the five major industrial States — excluding the superpowers — within the next 10 or 15 years (before the oil begins to run out), his military policy reflects a widely shared Iranian determination to restore his nation to the prominent position it usually occupied in the world before the humiliations of the past 150 years.

It does not seem all that likely, in fact, that any of the defence priorities that condition Iran's military build-up will require it to fight in the near future. There has been a marked relaxation in relations between Iran and Iraq since the border dispute and the Kurdish revolt ended in early 1975, and the two regimes seem at least for the moment resigned to living with each other. The Shah's relations with King Khalid of Saudi Arabia are a great deal better than they ever were with his predecessor King Feisal, and Saudi anxieties about Iran's intentions in the Gulf seem to have diminished considerably. In response to this, and thanks to the sheer passage of time since Iran seized Arab-populated islands in the Gulf in 1971, Tehran's relations with the smaller Emirates on the southern coast are distinctly warmer than at any time in the recent past.

Iran's intervention in Dhofar was a resounding success, but a similar introduction of Iranian forces into an Arab shaikhdom inside the Gulf itself would be an operation fraught with danger of creating a confrontation between Tehran and Riyadh. However, growing Saudi military strength, and Riyadh's increasingly prominent role in organising and co-ordinating the political and military defences of the smaller Arab Gulf States, have taken some of the urgency out of Iran's implicit commitment to suppress radical upheavals in the area. If Saudi Arabia is ready and apparently able to act as the local enforcer of political conservatism, Tehran will increasingly be disposed at least to let the Saudis try their hand first, before intervening itself.

As for Iran's first priority — defence against the Soviet Union — that too does not seem likely to involve the prospect of imminent crisis. Soviet—Iranian relations are good, and in any case the purpose of creating a convincing Iranian deterrent is precisely to avoid the necessity of fighting.

The Shah's anxieties in that direction were understandable at the time rapid Iranian military expansion began. His own father had been overthrown by a Russian invasion (with British help). The uselessness of the CENTO alliance to Pakistan had been demonstrated in 1965 and again in 1971, and by the latter year he was actually worried by the possibility of Russian encirclement. The Soviet friendship treaty with India in 1970 was followed by a similar treaty with Iraq in 1971, and that was rapidly followed by the break-up of Pakistan and an anti-conservative coup in Afghanistan. It was possible to envisage a pro-Soviet slide in Afghanistan and a further fragmentation of Pakistan, leading to the independence of a pro-Soviet Baluchistan, which would create a wall of Soviet influence down Iran's eastern border.

Such a series of developments would not only have effectively surrounded Iran and threatened its access to the Indian Ocean, but would also have created the opportunity for Soviet interference in Iran's domestic affairs through subsidising a Baluchi separatist movement in Iran's south-eastern corner. This gave Tehran all the more reason to collaborate with Pakistan in suppressing the latter's recent Baluchi troubles. The prospect of such an alarming chain of events receded greatly in the past few years, but it has been revived by the coup in Kabul in April, 1978.

Thus, the longer-term possibility of a Russian threat remains an Iranian concern, as does the determination to create a credible deterrent to it. In this context, consideration must be given to the question of Iranian nuclear weapons, simply because they constitute the supreme deterrent, and because Iran is frequently mentioned in this regard.

World Armies

Iran does have an extremely ambitious programme for developing nuclear power generation: by 1993, it intends that 52% of its installed power capacity should be nuclear (and that total capacity should be 14 times the present figure). Its first two nuclear reactors, of 1200MW each, are now being built near Bushire by a West German firm, and two more are to be constructed by a French firm on the Karun River. A contract for a further four West German reactors was signed in October, 1977 and Tehran is still interested in buying six to eight reactors from the USA.

Whatever safeguards may be applied, it is probable that Iran will possess sufficient resources and skilled manpower to manufacture its own nuclear weapons by the late 1980s, if it chooses — a recent estimate suggested that it might achieve that capability by 1985 — and it is clear that Iran would welcome such an option. On the other hand, Iran has signed the Nuclear Non-Proliferation Treaty, and the Shah's codicil that Iran would have to reconsider its stance if some of the smaller powers obtained a few atomic bombs, should not necessarily be taken to mean more than it says. The only further useful observation would be that nuclear weapons are not a logically indispensable component of an Iranian deterrent against Soviet attack.

The second major question — the loyalty of the Iranian armed forces to the Crown — is relatively easily answered. The armed forces have everything that they could want in material terms, and over two decades it has been the Shah's conscious policy to link their interests, both collectively and individually, with those of the Throne. He is still a relatively young man despite his long reign (he was born in 1919), but even if he should die prematurely there is good reason to think that the dynasty and the prevailing order might survive.

Iran is, of course, an authoritarian regime, and inevitably must contend with some violent resistance (there has been a sporadic urban guerrilla campaign since 1971). But there is little ground for believing that this could grow to represent a serious threat to a regime with such efficient and pervasive security forces, so long as economic growth continues to offer most Iranians the prospect of rising living standards.

The series of riots which shook most Iranian cities in the first half of 1978 was certainly very disturbing to the regime, and necessitated the deployment of army units in the streets for the first time since 1964. But if they were predominantly an outburst of right-wing religious resentment at the changes which are rapidly transforming Iranian society, supported mainly by those who have been the victims of those changes — as most observers believe they were — then they do not represent a force which could actually cause a revolution. The only force that could do that is one which could dissolve the alliance between the Shah and the armed forces, and that would much more likely arise on the left. There is, however, no sign that such a situation is emerging.

Finally, there is the question of the Iranian armed forces' actual military capability, as opposed to their mere size. Iran has not fought a real war for over a century, so there is no recent evidence on which to base a judgement (apart from small-scale incidents like Dhofar), but historically Iranians have not been inept in military matters. For what it is worth, United States Air Force instructors have been reported as comparing their Iranian student pilots with Israelis. A gap will certainly remain for the time being between the performance Iranian soldiers can get out of their weapons and what one might expect from the forces of a mature military power. But it may not be a very wide gap, and it will narrow as time goes on.

IRAQ

HISTORY AND INTRODUCTION

Iraq is renowned throughout the Arab world for the extraordinary turbulence and extreme violence of its domestic politics, which have been largely dominated by army factions for the past four decades (and overwhelmingly since 1958). Between 1956 and 1973 there was scarcely a year in which there was not a coup or an attempted coup. Between 1961 and 1975 there were only a couple of years in which substantial proportions of the army — up to 80%, in some years — were not committed to high-intensity regular military operations against Kurdish and other revolts. Since the establishment of the Ba'ath regime in 1968 there has been greater political stability, and since 1975 the Kurdish insurgency has been quiescent, but both these achievements are maintained only by a ruthless and utterly uncompromising military-political dictatorship.

Iraq is unquestionably one of the world's most difficult countries to govern, and it is idle to suppose that it could be successfully ruled at this point by any other method. Few other countries are so seriously divided in language and religion, with no natural majority. Few have such a powerful system of local, clan and family loyalties still flourishing beneath the formal political and administrative structures. Hardly any have so deeply entrenched a tradition of violent intrigue in politics at every level: no powerful man in Iraq moves about without a small platoon of bodyguards. Even the strident pan-Arabism of post-1958 regimes (and especially of the post-1968 Ba'athist regime, which is so purist that it finds it hard to co-operate even with other radical nationalist regimes devoted to Arab unity) serves only to conceal the fact that Iraq is the least 'Arab' country in the Arab world.

The explanation for all these phenomena lies in that series of misfortunes and catastrophes which is Iraq's history. At the beginning of recorded history it was one of the two wealthiest and most densely populated countries on Earth — at the beginning of the second millennium BC the population was about 1,000,000, and by the seventh century BC, under the Assyrian Empire, it probably touched 2,000,000. But even then it was subject to two recurring catastrophes which caused sudden great drops in population: periodic rises in the water table due to over-irrigation which would ruin most of the arable land of lower Mesopotamia through excessive salinity, and waves of conquest sweeping across the unprotected flatlands which form the Iraqi heartland.

Much of the population was Arabised after the Arab conquest in the seventh century AD, and as the centre of the Abassid caliphate the country enjoyed a golden age of civilised prosperity in the ninth century, rising to a record population of 2,500,000. But once again the water table rose, destroying the country's agriculture, and the ruin was completed by a century of appallingly destructive invasions in the thirteenth and fourteenth centuries by the Mongols under Hulagu Khan, followed by the hordes of Timur the Lame. By 1300 the population had dropped to 1,000,000, and five centuries later it was even slightly below that.

The experience of these five centuries, undoubtedly the darkest period in Iraq's long history, was the main influence that shaped the fundamental character of Iraqi political behaviour: extreme loyalty to one's own particular small group, usually linked by blood ties, and total hostility and distrust towards all beyond that group. It was the only means of survival in a country which became an impoverished borderland repeatedly devastated by invading armies and bereft of any significant or lasting civil administration.

Between the death of Timur in 1405 and 1831, Iraq was successively conquered by two Turcoman confederations, the Kara Koyunlu (Black Sheep) and the Ak Koyunlu (White Sheep), by the Safavid dynasty of Iran, by the Ottoman Turks, by the Persians again, and finally by the Ottomans again in 1638 after two unsuccessful invasions. The Ottomans soon lost all practical control outside Baghdad to various local potentates, however, and the attempts of two determined Ottoman governors in the first half of the eighteenth century to extend their authority over the whole country were thwarted by yet another devastating series of Persian invasions in 1729–43. They were repelled, but the country then fell under the rule of a slave (Mamluk) army, its soldiers mostly recruited from Georgia and converted to Islam as youths, which misgoverned Baghdad and Basra provinces until 1831, amidst continuous internal strife, yet another Persian invasion, and raids of growing intensity by the recently created Wahhabi State of central Arabia. Throughout this period, moreover, there were continual revolts by the great Arab tribal confederacies of Iraq and the Kurdish tribes of the north against whatever degree of local government authority did exist, and an unending series of raids out of the great Arabian desert to the south by nomadic tribes.

In 1831 the Ottoman authorities succeeded in exterminating the Mamluk army, and thereafter created a degree of central government and introduced certain imports from the modern world to Iraq — a telegraph and postal service, steamboats on the rivers, conscription for the army — but in almost all respects the Iraq of 1900 was hardly different from that of 1500. Development after 1900 was more rapid, but with the coming of World War I the country was conquered by the British Indian Army — Baghdad fell in 1917. Under the British military administration which ruled until 1920, its borders were

World Armies

defined as those of the Ottoman provinces of Basra, Baghdad and Mosul (although possession of the latter, mainly Kurdish, province was disputed by Turkey until 1926).

The independent country that was thus created under a British mandate from the League of Nations was culturally, economically and socially the most backward part of the Arab world at that time, except for the Arabian peninsula. Literacy and urbanisation were both well below 5%, extreme poverty was virtually universal, and traditions of civil government or civic co-operation were non-existent. Only in the previous decade had a nascent concept of Arab national identity begun to spread amongst the small educated class, especially amongst the Arabs of Baghdad province who belong to the orthodox Sunni sect which predominates throughout the rest of the Arab world. Even this, however, was scarcely to be found at all amongst the Arabs of Basra province in the south along the Euphrates river, where the majority of the population belonged to the Shiite sect of Islam and had close connections with Iran, where that sect predominates. The northern third of the country, Mosul province, was not Arab at all, but Kurdish, and had been included within its border by the British because of its promising oil deposits.

The basic problem of rule within the arbitrarily defined State of Iraq created in 1920, therefore, can be defined in terms of the population: about 25% are Sunni Arabs, 35% are Shiite Arabs and 20% are Sunni Kurds. (The remainder include Turks, Christian Assyrians and other smaller minorities.) Of all these groups, only the Sunni Arabs of Baghdad feel an instinctive attachment to the pan-Arab ideal. Under the Ottomans, themselves defenders of Sunni orthodoxy, Shiite Arabs were excluded from all participation in official activities, and the deep cleavage between the two Arab communities of Iraq continues today. The Kurds of Iraq form part of one of the largest submerged nations in the world, some 7,000,000–8,000,000 people split up between Iran, Iraq, Turkey and Syria. Only 2,000,000 Kurds live in Iraq, but they form a far higher proportion of the population than in any of the neighbouring States. Therefore, although they have fared far better in Iraq than elsewhere in terms of recognition of their language, right to local autonomy, etc. it is also in Iraq that their demands and their power have been greatest.

The solution to the problem of who rules Iraq, for which the Ottomans prepared the way and which was adopted by the British and continues undiminished in the republic, is that the Sunni Arabs run everything. For the Turks, it was a question of religious doctrine; for the British, one of convenience; for all of Iraq's post-independence regimes, the central issue of politics. It will be obvious that if no external imperial power is present to enforce this order of things, Sunni Arab rule can only be maintained by an authoritarian domestic government backed by strong military forces, and such has invariably been the case.

In recent decades this domination of the State by Sunni Arabs is explained (usually quite ingenuously) not to be discrimination against other sections of the population, but rather a preference for those who are dedicated to the cause of pan-Arab unity. It can just as well be argued, however, that the extraordinary and fanatical dedication of the Sunni Arabs of Iraq to the pan-Arab cause, far exceeding that of governments in more homogeneous Arab countries, is a justification of their privileged status and a means of perpetuating it. In more practical terms, there has been from the very inception of the Iraqi State a love/hate relationship with Syria, the one Arab country with which union would have practical significance: on the one hand, the declared goal of Syrian–Iraqi unification would create a State in which a majority of the population were reliable Arab patriots; on the other hand, the Sunni Arabs of Iraq would be a minority within that majority.

The British acceptance of Sunni Arab dominance in the mandate period in Iraq was not entirely deliberate. Partly because they owed the Hashemite ruling family of the Hejaz in what is now south-western Saudi Arabia a debt of gratitude for its military assistance against the Turks in World War I, and partly because they were anxious about the stirrings of Arab nationalism amongst the Sunni Arabs of Baghdad, the British imported the Hashemite Amir Faisal ibn Husain in 1921 to rule as King of Iraq. With him, however, came the Arab officers of the Ottoman Army who had defected to help Faisal lead the Hejazi tribal forces in the Arab Revolt during World War I.

Only Sunni Muslims were granted commissions in the Ottoman Army prior to the Young Turk Revolution of 1908. Moreover, a very large majority of the Arab officers in the Ottoman Army were recruited from Iraq, principally because there were more attractive civilian careers open to educated Arabs in more developed Syria which simply did not exist at that time in Iraq. Therefore, a large majority of the Arab officers who were infected by the rampant nationalism of their Turkish fellow officers in the Committee of Union and Progress after the 1908 Revolution, who responded by founding rival nationalist secret societies in the Ottoman Army (notably al-'Ahd — the Covenant) after 1910, and who then defected to provide the professional core of the Hejazi army in the Arab Revolt, were in fact Sunni Muslims from around Baghdad.

These were the men who came to Iraq with King Faisal, who formed the officer corps of the new Iraqi army, and who effectively dominated both the army and increasingly civilian politics as well for the next generation: the most influential of them even at the time of the Arab Revolt in 1916–18, Nuri as-Said, was the central figure in Iraqi politics from the 1930s onwards, and was Prime Minister as late as 1958.

Until the decision to place King Faisal on the newly created throne of Iraq, Britain had controlled the country with its own occupation forces and with the so-called Iraqi Levies, a paramilitary force recruited primarily from the non-Arab minorities like the Kurds and Assyrians. The new Iraqi army that was founded in July, 1921, however, was drawn principally from the Arab population, and it was the ex-Ottoman Army, ex-Hejaz Army Iraqi officers who became its officer corps. General Nuri as-Said was the first Chief of Staff. By 1925 the army numbered 7500 men, and by 1936 had reached 23,000. A military academy was founded in Baghdad in 1924, followed by a staff college in 1928. Numbers of

officers were also sent to Britain or India for advanced military training, and Britain provided instructors, advisers, arms and equipment in Iraq.

By 1936 the Iraqi army and the newly created air force were bodies of a reputable professional standard, although of course the great bulk of their operational tasks were in the internal security category against the continual tribal revolts. The officer corps, although as riven by personal cliques and factions as was the rest of Iraqi political life, was composed predominantly of Sunni Arabs, with some Kurds, drawing its recruits from the local political and economic *élites*.

In 1932 the British mandate over Iraq was terminated and the country gained full formal independence, but its actual dependent relationship with Britain scarcely changed: a 25 year treaty of alliance signed with Britain in 1930 provided for full consultation in foreign affairs, permitted the free passage of British troops through the country, and granted Britain two major airbases at Habbaniyah and Shu'aiba. Iraq was, however, one of the few Arab countries which were not fully under the control of European empires, and there was a steady growth in opinion in the officer corps from the simple anti-Ottomanism of the early years towards a broader anti-imperialist version of Arab nationalism. Discontent with the 'foreign' monarchy and with British indirect rule grew steadily.

This was only indirectly manifested in the military coup of 1936, the first such event in the Arab world. The short-lived regime of General Baqr Sidqi and his reformist followers was principally concerned to broaden the narrow circle of individuals with access to political power beyond the small group around the monarch, and had few specifically nationalist aims: indeed, Baqr Sidqi himself was a Kurd. His regime was unsuccessful and he was assassinated in 1937, but the government remained in military hands.

There was a growing number of Arab nationalist officers and, like those in Syria and Egypt at the same time, their opposition to Anglo-French imperial rule in the Middle East made them extremely susceptible to the advances of Nazi Germany. A group of Sunni Arab officers later known as the Golden Square, together with associated civilian supporters, elaborated a programme of Arab nationalism and anti-British imperialism which borrowed heavily from fascist political style and had strong support from local German representatives. Iraq duly severed its diplomatic relations with Germany when war broke out in 1939, but in 1941 the government was overthrown by the army leadership.

The new government, under the nominal leadership of General Rashid 'Ali al-Gaylani and with real control exercised by the Golden Square, announced its non-belligerent intentions and refused British troops the right of passage. British troops then attacked Iraq, while the Iraqi army besieged the RAF base at Habbaniyah near Baghdad. After only 29 days of fighting resistance collapsed, and a pro-British government returned to office. During the remainder of the war Iraq was occupied by the British. After a thorough purge of nationalist officers and wholesale reorganisation the Iraqi army was reduced virtually to an auxiliary unit of the British army, under the strict surveillance of British officers co-operating with officers loyal to the monarchy.

British occupation troops were withdrawn after 1945, and for the next 13 years Iraqi politics appeared to revert to the pre-war model, with growing oil revenues to help lubricate the creaking machinery of the monarchy and reward its privileged supports. 12,000 Iraqi troops were sent to fight in the first campaign against Israel in 1948; and Iraqi forces were again sent to the brother Hashemite kingdom of Jordan during the 1956 Suez War (though on that occasion they saw no action), but none of this disturbed the regime's close and indispensable links with Britain and the West. Indeed, in 1955 Iraq joined with Britain, Turkey, Iran and Pakistan to form an anti-communist, anti-Soviet alliance known as the Baghdad Pact (later CENTO, after Iraq's withdrawal). But inside the army dissatisfaction at the regime's corruption and its slavish dependence on Western support was growing, and new, more radical political views were spreading into the army.

The most important of these was the Ba'ath (Renaissance) Party, which had been founded in 1943 in Syria by Michel Aflaq, a French-educated Christian Syrian intellectual. It was a movement with tremendous potential appeal to Iraqi Arabs as well, being socialist, anti-imperialist and dedicated to the creation of a single Arab State from Basra to the Atlantic — with the initial goal of creating a 'Greater Syria' including Iraq, Palestine and Jordan. The foundation of the Iraqi branch of the party took place in 1949, immediately after the Arab defeat in the war in Palestine, apparently at the inspiration mainly of Palestinian refugees and Iraqi students who had been educated in Syria. It grew rapidly in secrecy, adopting the cellular organisation familiar in Communist Parties working underground, and in 1954 it was erected into a full 'regional' (i.e. Iraqi) branch of the 'national' (i.e. pan-Arab) Ba'athist movement.

The closing years of the Iraqi monarchy were characterised by extreme repression — massacres of jailed political activists, the suppression of all political parties, and from the time of the Suez crisis in October, 1956 continuous martial law — but the regime was unable to prevent the spread of new ideas amongst the Sunni Arab population and especially the army officer corps. The Ba'ath Party had strong competitors in the Iraqi Communist Party and the Nasserist group which hoped to emulate the achievements of the Egyptian Free Officers' Movement of 1952, but all were prepared to co-operate at least for the limited purpose of overthrowing the monarchy and breaking Iraq's unequal alliance with the West.

The receptivity of army officers to these groups was greatly enhanced by the fact that the Military College in Baghdad had been thrown open to a much wider range of applicants after the Baqr Sidqi coup of 1936. The newer breed of officer, drawn increasingly from lower-middle-class and small-town Sunni Arab society rather than from the privileged upper classes of Baghdad, was reaching the key major-colonel rank bracket in the early 1950s, and responded readily to all these revolutionary ideologies. Nasserists, Ba'athists and communists in the army all co-operated in the unsuccessful attempted coup of 1956, and were again associated to a greater or lesser extent with the successful coup of July 14th, 1958 in which King Faisal II, the Crown Prince and Prime Minister Nuri as-Said were all killed. Iraq was declared a republic, left the

World Armies

Baghdad Pact, and turned to the Soviet Union as its principal arms supplier. Large numbers of executions took place, and the communists rapidly organised a paramilitary force known as the People's Resistance Force which was particularly strong in the Kurdish areas.

The two principal architects of the coup were Brigadier (later General) 'Abd al-Karim Kassem and Colonel (later Field-Marshal) 'Abd as-Salam Muhammad Aref, commanding the two armoured brigades near Damascus. Kassem was an ultra-nationalist of leftist inclination, but without formal links with any of the conspiratorial political parties, while Aref was loosely associated with the Ba'ath. In the power struggle that followed Kassem won, and by November, Aref, having failed to overthrow Kassem in an attempted coup staged in Mosul with Nasserist and Ba'athist support, was on trial on charges of treason. Within a year, despite several outbreaks of armed resistance, all Nasserist, Ba'athist and communist officers had been excluded from the government, and the communist militia had been forcibly disbanded. In October, 1959 Kassem was the target of an assassination attempt in central Baghdad led by Saddam Hussein Tikriti of the Ba'athist Party (then a 22 year-old student and Ba'athist gunman, now the strongman of Iraq). Kassem escaped with a wounded shoulder, while the severely wounded would-be assassin escaped to Syria, followed by those Ba'ath leaders who escaped arrest.

Kassem's period of violent and xenophobic rule initiated all the themes which have since dominated Iraq's political and military history: hostility to almost all neighbouring States, domination of Iraqi politics by soldiers, an extreme position in favour of pan-Arab union combined with bad relations with almost all existing Arab governments, the imposition from above of an authoritarian version of 'Arab socialism', and close links with the Soviet Union. It also saw the first of the series of sweeping purges, summary executions and outright bloodbaths which, repeated numerous times as coups brought different governments to power, have by now winnowed down the army officer corps to a relatively homogeneous remainder that is Arab, Sunni and either members of, or at least passively loyal to, the Ba'ath Party.

Kassem's regime made enemies outside Iraq, by claiming Kuwait at that country's independence in 1961, thus angering the conservative Arab States, and by disputing Nasser's claim to leadership of the radical Arab group. It made even more enemies inside Iraq by ruthlessly repressing Ba'athists, Nasserists and Kurds. The refusal of the regime to grant Kurdish demands for autonomy was the biggest single factor that weakened its hold on power, for as a result the Kurds rose in revolt in March, 1961 under Mustafa Barzani. Control was lost over much of the north within months, and by 1962 the Iraqi army was heavily engaged in a war that was to last, with interruptions, for 14 years. For the course of the Kurdish revolt, *see* Recent Operations. An alliance of officers loyal to Colonel Aref, co-leader of the 1958 revolt, and of Ba'athist officers succeeded in carrying out a coup in February, 1963: Kassem himself was captured and shot, and Colonel Aref became President with the Ba'athist officer Ahmad Hassan al-Bakr as Prime Minister. Pro-Kassem, pro-Nasser and communist officers and civil servants and those of Kurdish origin were thoroughly purged, and numbers were executed after mass trials. The Ba'athist militia, the National Guard, also massacred several thousand communists without trial.

Shortly afterwards a Ba'athist regime also seized power in Syria, and a federal union between Iraq, Egypt and Syria was tentatively agreed in April, 1963. This led to a split in the Iraqi Ba'ath Party between extremist pan-Arab elements and the more moderate faction which feared the consequences of precipitate union. When the moderate faction gained control of the Iraqi Regional (national) Command of the party in November, 1963 the extremist faction made an unsuccessful attempt at a *coup d'état* in the course of which air force elements attacked the Presidential Palace and the Ministry of Defence. President Aref assumed full powers, and crushed the Ba'athist paramilitary National Guard in street fighting; some moderate Ba'athists remained in his government, but the party had again lost its hold on power. One important consequence of this episode was to confirm the dominant role of the military wing within the Ba'athist Party, as it was clear that the party's loss of power had been largely due to the extent to which the civilian wing had alienated the professional officer class as a whole with its attempt to create a paramilitary rival in the National Guard.

Muhammad Aref's regime survived an attempted coup by Nasserist officers in early 1966, and 2 months after his death in a helicopter crash in April of that year his brother and successor in the presidency, Major-General Abd al-Rahman Aref, had to crush another attempted coup mounted by the same elements in the army. The Six-Day War of 1967 found the army in a transitional period; most of its equipment was by now of Soviet origin, but training doctrines were still British and the number of Soviet advisers was kept to a bare minimum. Iraqi troops were dispatched to assist on the Jordanian front, but were badly mauled by the Israeli air force before they could even get into action.

The regime of the second Aref brother staggered on into 1968, though generally reckoned both corrupt and inefficient, until it was overthrown by the sudden and bloodless coup of April 17th, 1968. This time it was a coup of solely Ba'athist inspiration: Aref went into exile, and the Ba'athist general who had briefly been Prime Minister in 1963, Ahmad Hassan al-Bakr, became President. The army was purged once again, and members of former governments were given long jail sentences or died in mysterious circumstances. Westerners were expelled in large numbers, the remaining Western interests in the country including the oil companies' holdings were nationalised and the full apparatus of an authoritarian police State was rapidly put in place. Public executions were commonplace, including the hanging of 11 Iraqi citizens, of whom nine were Jews, from lamp-posts in Baghdad's main square as 'spies for the United States, Israel, imperialism and Zionism'. Amongst those who made televised confessions of having been agents of the CIA and Israel after secret trials were a former president, two former prime ministers, a former Army Chief of Staff, the military leader of the Kurds and a son of the spiritual leader of the Iraqi Shiites: by early 1970 there had been over 100 public executions.

These extreme measures worked, for they gradually put an end to the cycle of coups: President al-Bakr and the Ba'ath Party are still in power. The army has been made an exclusively Ba'ath preserve, and there has even been some progress in

reviving the influence of the civilian wing of the Ba'ath Party. This has been particularly evident in the rise to power of al-Bakr's protégé, Saddam Hussein, who first came to prominence when he attempted to machine-gun Kassem in 1959 and is now Vice-President of the Revolutionary Command Council (RCC) (although he found it tactful to take an honorary degree from the Military Academy and to assume the military rank of general in 1976).

While the professional jealousy of army officers for rival claimants to power and also genuine political and ideological differences do play a real part in Iraqi politics, however, it is evident that, under the Ba'ath as much as under the Aref brothers or Kassem, the real foundation and structure of power in Iraq are still the alliances formed between officers and civilians who are linked by ties of blood or locality. This phenomenon, typical throughout Iraq's modern history, finds its major expression at present in the so-called 'Tikriti gang' which dominates the Ba'athist regime.

Tikrit is a small town of some 30,000 people, located about 100 miles north of Baghdad, which was the birthplace of President al-Bakr. It was also the home of Air Marshal Hardan al-Tikriti, first Vice-President of the RCC, and of his successor Saddam Hussein, who is now the effective ruler of Iraq. Many other prominent figures of the regime are also Tikritis, including General Adnan Khairallah Talfah (a brother-in-law of Saddam Hussein), who in October, 1977 took over the post of Defence Minister which had been held since 1973 by the now-ailing President al-Bakr.

This is not to say that the bitter civil-military rivalry within the Ba'athist hierarchy has been ended, nor that the Tikriti faction does not have its own internal quarrels. In 1970 Hardan al-Tikriti attempted a coup to halt the rising influence of Saddam Hussein. (He failed, and was murdered in Kuwait the following year, while forty other officers and civilians were executed by the regime.) In July, 1971 there was another attempted coup by army and air force officers. In 1973 the civilian security chief, Nazim Kazzar, attempted to destroy the dominant military influence within the RCC in another abortive coup (Defence Minister Hamad Shihab was killed, and another prominent military member, Saadoun Ghaidan, was wounded). But in general the Tikritis stick together, and have such a strong representation in the upper echelons of the armed forces that there have been no further coup attempts since 1973.

While Iraq under the Ba'ath continues to be a near-totalitarian State, the killing or torture of opponents of the regime is now conducted in secret, and a significant degree of *détente* has been achieved with rival internal forces. The two most striking achievements of Vice-President Saddam Hussein have been the creation of a National Progressive Front enlisting the support of the Iraqi Communist Party for the regime in 1973 (although it is still allowed to operate only within the narrow bounds permitted by the Ba'ath Party), and the pacification of the Kurdish north in 1975 after 15 years of intermittent war, an achievement made possible by a diplomatic agreement with Iran. The development of the internal economy has been extremely rapid in recent years, due mainly to Iraq's rising oil production (which will exceed that of Iran within the next few years) and the greatly heightened oil prices since 1973.

There has also been a significant easing in the virulently hostile policies which Iraq pursued towards most of its neighbours and the world beyond in the early years of the Ba'ath regime. The long-standing dispute with Kuwait was reduced in negotiations in 1977 to a mere disagreement over the terms of lease of Kuwaiti territory which had been forcibly seized by Iraq in an earlier period, and the border between the two countries was reopened. The bitterly hostile relations with Iran caused by territorial disputes and Iranian aid to Iraq's Kurdish insurgents, which more than once had threatened to erupt into full-scale war, became cool but correct after the remarkably statesmanlike gesture of Saddam Hussein in 1975 when he abandoned Iraq's territorial claims in return for Iranian abandonment of the Kurdish revolt.

Even the most venomous quarrel in the entire Arab world — that between the Iraqi and the Syrian governments and Ba'ath Parties — was at least temporarily composed in 1978. The quarrel, which led to a complete split in 1966 and the creation by both the Iraqi and Syrian 'regional' Ba'ath Parties of rival 'national' (pan-Arab) Ba'ath commands, was nominally about esoteric ideological differences, but actually owed a great deal more to personal and factional rivalries and the fear within each party that it would be manipulated or dominated by the other. A significant material point of difference arose after the accession to power of the current Syrian Ba'athist leader, Hafez al-Asad, in 1970, when the Syrian regime officially accepted the possibility of a negotiated peace settlement with a sovereign and still-surviving Israel — something no Iraqi Ba'athist leader has ever reconciled himself to. The need for a united Arab radical front in face of Egypt's peace negotiations with Israel finally overcame even the bitter Syrian-Iraqi hostility, however, and in October, 1978 the borders between the two countries were reopened, the military forces which both sides had kept stationed there were withdrawn, and the two nations formed a military co-operative committee to draft a defence agreement to serve as the basis for full military union between them. There have been many such agreements in the past between these and other Arab States, none of which has lasted, but just the fact that the Baghdad regime would have anything to do with the Syrian Ba'athists is in itself a most significant sign of Iraq's growing pragmatism in foreign affairs.

This pragmatism has its finest hour in Iraq's relationship with the Soviet Union, its main arms supplier since 1958. The Ba'athist regime signed a 15 year 'Friendship and Co-operation Treaty' with the Soviet Union in 1972 from which it reaps significant economic, military and diplomatic benefits, but it has not been allowed to compromise the regime's independence in any way. Iraq has been careful to diversify its sources of arms supply (principally to France) and maintains extensive economic and trading links with most Western countries. Although Baghdad shares with Moscow a generalised hostility to the 'imperialist West', its specific foreign policies are as often as not opposed to those of the Soviet Union: over the Kuwaiti and Iranian confrontations in the past, over the legitimacy of Israel and the desirability of a negotiated Middle East peace, and most recently and sharply over the Soviet presence and policies in the Horn of Africa. No Soviet objections were permitted to stand in the way of Iraq's proposed re-establishment of diplomatic relations with the USA (broken since

World Armies

1967) in 1977, although those negotiations eventually failed for other reasons. The regime ruthlessly executes local communists who attempt to step beyond the narrow political sphere allotted to them.

The present Iraqi regime resembles all those since 1958 in being essentially a government of Sunni Arabs over Iraq's other minorities, in being xenophobic and fanatically pan-Arab, while avoiding actual commitments to political union with other Arab States, and in being ultimately dependent upon its supporters in the army. It differs in having created a mass civilian party (the Iraqi Ba'ath Party, estimated to have 5000 members in 1968, now has 50,000–60,000 regular members, around half a million 'friends and supporters', and another million 'adherents', by its own reckoning), in having enough money to keep its supporters and other Iraqis at least passively contented, and in having established an efficient semi-totalitarian system. The key to its survival is still the army, however, and here too it has apparently been remarkably effective in removing all non-Ba'ath officers from sensitive positions. While severe civil–military tensions remain, they are mainly within the Ba'ath Party, which dominates both spheres. As a result of all this, the regime certainly has a far more secure hold on power than any of its predecessors, and can probably continue to pursue its totally independent course in foreign policy.

STRENGTH AND BUDGET

The strength of the Iraqi armed forces in 1978 was 212,000 men, of whom 180,000 were in the army, 28,000 in the air force (of whom 10,000 are Air-Defence personnel) and 4000 in the navy. Army reserves are about 250,000 and the main paramilitary force is the Ba'ath Party militia (the People's Army) consisting of approximately 75,000 men trained and equipped on the military model. There are also 4500 'security troops' under the control of the Ministry of the Interior.

There has been a steady increase in the size of the armed forces from 23,000 in 1936, to 50,000 in 1958, to 82,000 in 1966, followed by a leap of more than 150% to today's figure. This has been made possible in part by the extremely rapid growth rate (over 3% per annum) of Iraq's population, which now numbers 12,500,000, but is mainly due to the four-fold rise in government oil revenues after 1973.

Iraq's defence expenditure in 1977–8 was 491,500,000 dinars (\$1,660,000,000), amounting to 11% of the GNP of \$16,300,000,000. This military budget figure represents a much greater rise in expenditure than in manpower — the 1965 budget was ID87,000,000 — but much of it is spent on new Soviet and French arms. As a proportion of GNP, recent military budgets have actually fallen from the average of 13% in the mid-1960s, due to the great increase in oil revenues.

COMMAND AND CONSTITUTIONAL STATUS

The President of Iraq, Field Marshal Ahmad Hassan al-Bakr, is also President of the Revolutionary Command Council (the supreme executive and legislative body), the Prime Minister of the Council of Ministers (cabinet), the Secretary-General of the Regional (Iraqi) Ba'ath Command (the Party's executive body) and Commander-in-Chief of the Armed Forces. He was also Minister of Defence until 1977, when he yielded this post to General Adnan Khairallah Talfah, a close associate.

In the Provincial Constitution of 1968 the Revolutionary Command Council is identified as the highest authority in the country, with full executive powers and also with legislative powers pending the election of a National Assembly (an event which has yet to occur). The precise channels by which the body's decisions are transmitted to the armed forces have not been publicly identified, but in practice it may be assumed that control is exercised by President al-Bakr in association with Vice-President Saddam Hussein through their appointee, Minister of Defence Khairallah Talfah.

The other vital element in maintaining the stability of the regime is direct control over the Baghdad garrison and the general reserve. Direct command of the Baghdad garrison (the Republican Guards mechanised brigade, one infantry division and one independent armoured brigade) has been exercised ever since 1968 by General Saadoun Ghaidan, who is a close associate of President al-Bakr and the only other man to have been a member of the RCC at all times since the Ba'ath seizure of power. General Ghaidan also holds the key position of Minister of Communications in the Council of Ministers.

The general reserve, consisting of one armoured and one mechanised division, one special forces brigade and one independent infantry brigade, is like the Baghdad garrison commanded by officers who are considered the most loyal to the regime. In recent years it has been based at Tikrit, 100 miles north of Baghdad, which is the power base of the ruling faction within the Ba'ath Party. (In 1969 Iraq's 14 provinces were increased to 16 departments, and Tikrit became a separate administrative division.) Apart from the Baghdad garrison and the general reserve at Tikrit, all other army formations are kept well away from the capital, and in times of tension may even be routed around it when moving from one part of the country to another.

Under the Minister of Defence, who is believed to be formally in the chain of command, operational control is the duty of the Chief of the General Staff, also based at the Ministry of Defence in Baghdad. This officer is also invariably the Chief of Staff of the Army. The Commander of the Air Force, which is a separate service, is nonetheless subordinated to the army in the person of the Chief of the General Staff; air force headquarters are in Baghdad. The small navy is an integral component of the army, and the Commander of the Navy comes under the control of the Chief of Staff of the Army (although the distinction is a purely technical one, he being the same person as the Chief of the General Staff). Navy headquarters are at Basra.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role and Commitment

The Iraqi army organises and deploys itself in support of three principal roles: defence of its own position within the regime; defence of the regime as a whole against internal enemies, primarily the other national minorities; and defence or attack against external enemies.

The first role, that of safeguarding the ruling faction within the Ba'ath Party from its rivals and of defending the large influence of the armed forces within the Party, is achieved by political manoeuvre backed by specialised troops — the Baghdad garrison and, to a considerable extent, the general reserve at Tikrit — which are mainly devoted to this role. They are equipped more or less in the standard way, but it is, for example, scarcely conceivable that the troops of the Baghdad garrison would ever be sent away from the capital in support of some other commitment. The forces against which these troops might be called upon to fight are primarily the People's Army maintained by the civilian wing of the Ba'ath Party (whose strength in the capital is not significantly inferior to that of the army's Baghdad garrison except in armour), or rebel army or air force units.

Deployment

The second main role, that of controlling Iraq's non-Sunni Arab communities, is what usually occupies the greater part of the army. In the case of the Shiite Arabs of the south this has not called for more than riot-control duties which are performed by combat units that do not have specialised riot-control equipment. In the case of the Kurds, however, the maintenance of control has involved the army and air force in protracted conventional military campaigns as well as an unending counter-insurgency task. (For details of the Kurdish campaigns, *see* Recent Operations.)

On average, therefore, about half the army has been stationed in the north for the past 20 years. This is not as great a disadvantage for the third role (external defence) as it might seem, however, for the main external threats to the country in this period have been seen as coming from Syria and Iran. In both cases the principal avenue of attack would be into the north of Iraq, which also contains the vital oil fields which are the most important point to defend, so the centre of gravity of the army and air force is in the right place for defence against external attack anyway. Drawing also on the general reserve stationed at Tikrit, about halfway between Baghdad and Mosul, the principal city of the north, the Iraqi army has repeatedly shown itself able to concentrate approximately half its total strength against either Iran or Syria within a very short time, without exposing the oilfields to danger or relinquishing control of the Kurdish areas.

The normal deployment of the army around the country, at times when there is no particular border defence or counter-insurgency task demanding priority, is a good indication of the relative importance assigned by the Baghdad regime to various threats. In early 1977 it was as follows: at Mosul, covering the Turkish and Syrian borders and protecting the approach to the Kirkuk oilfields in the event of further hostilities with the Kurds in the north, one armoured and one mechanised division and one independent infantry brigade; at Kirkuk, controlling the southern part of Kurdistan and covering the northern part of the Iranian border, one armoured and two infantry divisions; at Tikrit, serving as general reserve and equidistant from Baghdad and the central part of the Iranian border, one armoured and one mechanised division, one special forces brigade and one independent infantry brigade; at Baghdad, one Republican Guard mechanised brigade, one infantry division and one independent armoured brigade; and in the south around Basra, covering the Kuwaiti border and the southern part of the Iranian frontier, one armoured and one infantry division.

Since the settlement of all outstanding issues with Iran in 1975 (for the confrontation with Iran, *see* Recent Operations), the defence of that frontier has not been given a very high priority. In the event that it should again become important, one would again expect to see Iraq in an essentially defensive posture. This is due not only to the greater size and superior equipment of Iranian forces that could be deployed along the frontier, but also to the arguments of terrain. While Iran's vital oil terminals and general ports of Khorramshahr and Abadan in the south are right on the river that forms the border, the extremely narrow neck of Iraqi territory leading down from Basra to the Gulf, averaging about 30 miles wide, would make it very difficult for Iraq to mount an offensive into Iranian territory there, while an Iranian river-crossing could quite possibly cut Iraq off from the sea. In the north, by contrast, the mountains begin at the Iranian frontier and offer no strategically significant targets to an Iraqi attack anyway, while going the other way both Baghdad and Iraq's main oil area around Kirkuk are only 80 miles from the border across fairly good tank country.

Access to the Gulf is a major Iraqi defence concern, since most of the country's imports and exports (including, since the 1975 opening of a pipe-line southwards from the oilfields, over one-third of its oil exports) must pass through the Gulf. Iraq has built up a small navy of missile-armed fast patrol boats to defend access to its 30 miles of coastline at the head of the Gulf and to its main ports a short distance up the Shatt al-Arab, but basically the problem is insoluble since Iran controls the exit from the Gulf to the Indian Ocean from bases well out of range of Iraqi forces. The government's natural anxiety at being the only radical regime in an area otherwise populated by conservative, pro-Western States had made it the main obstacle to the conclusion of a Gulf security pact, a goal avidly sought by some of its neighbours. It was Iraq's dissent which prevented the realisation of such a pact at the meeting of littoral States held in Oman in 1976, since it felt unable to agree to a rule excluding outside naval forces from the Gulf. The other States would feel perfectly secure in their own numbers and naval

World Armies

strength if the United States navy were excluded from the Gulf, but for Iraq the only equaliser is the ability of the Soviet navy to cruise in these waters.

Iraq's nervousness about its access to the Gulf also lies at the root of its continuing dispute with Kuwait, which has stimulated the latter into an arms build-up aimed at matching Iraqi forces deployed in the vicinity. The claim to all of Kuwait raised by the Kassem regime in 1961 has long since been dropped, but in order to protect the approaches to its sole naval base of Umm-Qasr, the only regular Soviet naval port of call in the Gulf, Iraq has long occupied the Kuwaiti islands of Warba and Bubiyan. There have also been Iraqi incursions into Kuwaiti territory at Samita on the mainland side of the channel leading to Umm-Qasr, notably in 1973, and further border clashes occurred in 1976. Following a visit by the Kuwaiti Defence Minister to Baghdad in July, 1977 the border between the two countries was reopened for the first time in 5 years. Iraq has proposed a solution whereby it would lease the islands for military purposes, together with a coastal strip of the opposite mainland which is still under Kuwaiti control, while permitting the Kuwaiti civil administration to return to the islands, but at the end of 1978 there had been no agreement on the precise terms of this solution.

The desert half of Iraq extending south and west to the Saudi Arabian, Jordanian and Syrian borders contains little population and almost nothing of economic importance except oil pipe-lines, and the same is largely true on the other side of those borders. Iraq has some minor border disputes with Saudi Arabia, and bitter ideological quarrels with both the Saudis and Jordan, but large-scale hostilities on the Saudi Arabian or Jordanian borders are both logistically and strategically implausible. The 12 year vendetta between the rival Ba'athist regimes in Damascus and Baghdad (given at least a temporary burial in October, 1978) repeatedly led to the protagonists concentrating a couple of divisions each on their common frontier, but the considerable distances between the Syrian-Iraqi frontier and strategically significant objectives in either country make it unlikely that anything more serious than large skirmishes would ever occur. There have never been military tensions along Iraq's border in the north with Turkey, although extensive counter-insurgency operations against the Kurds have been carried out on the Iraqi side.

What remains to be considered is the Iraqi armed forces' capabilities against Israel. Iraqi contingents have fought in three of the four Arab-Israeli wars (in 1967 they arrived too late for the fighting, although about 20,000 Iraqi troops remained in Jordan and Syria until January, 1971). In any future war where they were trying to reach the front after the outbreak of hostilities they would again suffer heavy Israeli air attack while their columns and convoys were crossing Syria, as they did in 1967 and 1973, and they would again be thrown into combat piecemeal, with probably disastrous results. Moreover, the range of some of the new aircraft recently acquired by Israel brings Iraq's oil fields within reasonable attack range, and it is known that the Iraqi air force has recently mounted 24 hour combat patrols above the oil installations at times of high tension in Arab-Israeli relations.

The situation would be rather different, however, if the agreement between Syria and Iraq of October, 1978 to move towards full military union in order to counter Egypt's proposed peace treaty with Israel should actually take effect. It was envisaged by the architects of this agreement that substantial Iraqi forces would be permanently stationed in Syria near the Israeli border to strengthen the so-called 'Eastern Front' of Jordan, Syria and the Palestine Liberation Organisation. Even if Syria can bring itself to trust large Iraqi forces in the vicinity of Damascus, and if the Iraqi regime feels secure enough at home to send more than one or two divisions, however, the Arab forces thus gathered together would have no serious potential for offensive action against Israel. Only in the totally improbable eventuality that Iraq actually sent most of its army to Syria would the 'Eastern Front' even enjoy numerical equality with mobilised Israeli forces. As an additional prop to the overstretched Syrian forces in a defensive war, however, almost anything Iraq could send would be of use. There has not at the time of writing (November, 1978) been any detailed discussion between Syria and Iraq about the numbers of Iraqi troops that might be sent, the logistical arrangements that would be necessary, or the command structure that would control them.

In late 1978 there were no Iraqi forces deployed beyond the country's frontiers. Some 500 Iraqi troops were sent to Lebanon in the summer of 1976 to fight on the side of the Palestinian-Muslim leftist alliance, but they were withdrawn after the introduction of the Arab League's predominantly Syrian peacekeeping force.

Recent Operations

The Iraqi army's only recent experience of high-intensity conventional combat was in 1973, when an armoured formation arrived on the Golan front 10 days after the war began. It was caught by Israeli aircraft and artillery while still deploying, and lost about 100 tanks in a couple of hours.

In counter-insurgency operations, on the other hand, only the Sudanese army in the Arab world can begin to approach the Iraqi army's experience. It easily destroyed a brief guerrilla campaign in the southern marshes of the country led by a breakaway faction of the Iraqi Communist Party in 1969-71, but its main field of operations from 1961 to 1975 was in Iraqi Kurdistan.

The Kurds, divided between four nations since the partition of the Ottoman Empire in 1918, constitute a larger proportion of the total population in Iraq (about 20%) than in any other country, and sporadically revolted even during the period of British rule. Immediately after World War II, when the Soviet Union was maintaining a 'Kurdish Republic' in Russian-occupied north-western Iran, Moscow provided military aid to a more serious Kurdish rebellion in Iraq led by the feudal chieftain General Mullah Mustafa Barzani. When American pressure forced the Russians to withdraw from Iran the

aid dried up and Barzani was obliged to go into exile in the Soviet Union, but he returned in 1958 on the overthrow of the monarchy. He established himself as the titular head of the Kurdish Democratic Party (KDP), a theoretically socialist grouping dedicated only to Kurdish autonomy within Iraq, but in reality he always overshadowed it as a powerful military leader drawing his strength from traditional tribal loyalties.

Following unsuccessful negotiations with the Kassem government for Kurdish autonomy, Barzani declared an independent Kurdish State in March, 1961 and in the course of the next year drove Iraqi government forces out of all the Kurdish areas along the Turkish and Iranian frontiers. The war then settled into a pattern that lasted throughout the 1960s: a spring and summer offensive by government forces, with the ground won in that offensive then being regained by the Kurds in the autumn and winter. Barzani had tacit Soviet support, though little direct military aid, and the Iraqi army proved unable to cope with the combination of almost universal Kurdish support for the revolt and the exceedingly difficult mountainous terrain. The war was punctuated by a negotiated ceasefire in 1964 and in 1966, based on major concessions by Baghdad on Kurdish national rights, and a section of the Kurdish population led by Jalal Talabani even rallied to the Iraqi side on the second occasion, but a final settlement and a complete end to the fighting were never achieved.

Following the Ba'athist coup of 1968 the fighting was resumed in full intensity, and by 1969 the Kurdish rebel army (about 15,000 strong) was even shelling the vital oil installations at Kirkuk on the disputed border between Kurdistan and Iraq proper. In 1970 the Ba'ath regime produced a 15-point peace plan which granted most Kurdish demands: Kurdish representation in the government, equal status for the Kurdish language in the north, government acceptance and support for Barzani's troops as an official Iraqi frontier force, the appointment of Kurdish officials in Kurdish majority areas, and constitutional recognition that Iraq was a bi-national State inhabited by Arabs and Kurds. Fighting stopped almost immediately, but over the following years it became evident that the Baghdad government had no intention of fulfilling most of its promises. A number of attempts were made to assassinate Barzani and his closest aides, and the autonomy statute promulgated by Baghdad after the agreed delay in April, 1974 failed to satisfy Kurdish expectations in a number of respects: notably, in denying Kurds representation on the Revolutionary Command Council, and in excluding from the Kurdish autonomous area the districts around Kirkuk containing the main oilfields, where the Kurds claimed to be in the majority.

Barzani and his militia, the Pesh Merga, resumed fighting immediately and by the latter part of 1974 the war was being fought at a hitherto unprecedented intensity. Most of the Iraqi army was deployed in Kurdistan, suffering heavy casualties, while the air force was employed in making saturation bombing attacks on Kurdish villages in rebel-held areas. It became a war of semi-conventional character, with brigade-sized engagements occurring at frequent intervals. The Kurds were amply supplied with heavy weapons, including artillery and anti-aircraft guns, and the Iraqi army was unable to subdue the resistance. Most of the districts along the border were completely under KDP administration.

The great difference in 1974 was that the Kurds had the active support of Iran and the tacit support of the USA, and large quantities of weapons and supplies were flowing into them across the Iranian border. Following a lengthy series of border incidents, Iran had denounced the 1937 treaty defining its border with Iraq, and demanded revisions along the Shatt al-Arab, the river which gives access both to Iraq's only ports and to Iran's main oil termini. The 1937 agreement imposed by the British had placed the frontier on the Iranian bank, making the river exclusively Iraqi territory, and Iran demanded that the frontier be recognised as running down the centre of the river. Tehran's military support for the Kurdish insurgency was entirely a means of extorting Iraqi agreement to this claim (Iran, after all, cannot afford to play with Kurdish autonomy, having more Kurds within its borders than Iraq), but Barzani made the fatal error of making himself wholly dependent on Iran's support.

Iran's strategy worked: in March, 1975 at the OPEC meeting in Algiers, Iraq agreed to settle the border dispute on Iran's terms, and to cease supporting revolutionary groups in Iran. In return, Tehran agreed to end 'infiltrations of a subversive character', that is, to end all support for the Kurdish revolt. Kurdish resistance promptly collapsed, and by May, 1975 200,000 Kurds had fled across the border to Iranian refugee camps. Barzani retired to the USA, almost totally discredited, and Iraqi government forces occupied all of Kurdistan.

Baghdad formally maintained the Kurdish autonomy statute and proclaimed an amnesty for Pesh Merga soldiers. Some 50,000 of the returning refugees, however, were forcibly resettled in southern Iraq, and the entire Kurdish area remains saturated with Iraqi army units. Extensive fortifications have been built around Kirkuk and Mosul. Kurdish sources claim that Baghdad is following a policy of Arabisation in these vital areas of mixed population, by bringing in large numbers of Arab settlers from the south, and that a 25 mile strip of land along the Turkish and Persian borders is being systematically emptied of its Kurdish population. On the other hand, about 40,000 Kurds were allowed to return to Kurdistan from the south in April, 1977.

Following the shock defeat in 1973, the KDP splintered into a number of warring factions, but by 1977 guerrilla attacks were again becoming frequent in Iraq's Kurdish areas. The bulk of the fighting, however, was between two rival Kurdish groups: the KDP-Provisional Leadership, which claims to have inherited Barzani's mantle, and the Patriotic Union of Kurdistan (PUK). The latter was an alliance between Jalal Talabani's original group of that name (he had long since broken his links with Baghdad), the Association of Marxist-Leninists of Kurdistan, and Ali Askari's Socialist Movement of Kurdistan. The KDP-PL, having renounced any dependence on outside sources of aid like Iran and the USA, and having reverted to a strategy of protracted guerrilla warfare, officially adopted a socialist programme for the first time in 1976. The PUK, based in Damascus, received strong support from Syria, Iraq's inveterate enemy, in attempting to revive the revolt.

World Armies

In a major clash in July, 1978 near the Iranian border the KDP-PL claimed to have captured 400 PUK fighters, including Ali Askari, 'Supreme Military Commander', and all its other leaders operating inside the country except Talabani himself. The PUK's ability to challenge the long-established KDP for control of the 'second revolution', as it is known, has been further sapped by the reconciliation between Syria and Iraq which, if it lasts, will cut the PUK off from its supplies and arms. The potential for a renewed large-scale Kurdish revolt is still in existence, but it is unlikely that it will actually flare into major warfare again in the near future.

ORGANISATION

Arms of Service

The army is divided into combat arms — infantry, armour, artillery and engineers — and services essentially along British lines. There are also *élite* units such as the Republican Guards brigade and the Special Forces brigade. The air force is organisationally separate, although under the effective operational control of the Army Chief of Staff through his other appointment as Chief of the General Staff. It is divided into flying and non-flying personnel, and the latter group is further divided into various technical specialities, along the same lines as the British Royal Air Force. The small navy is an integral part of the army.

Operational

The army is organised into four armoured, two mechanised and four infantry divisions, plus one independent armoured brigade, two independent infantry brigades, one special forces brigade and one Republican Guards brigade. Divisional organisation is triangular: armoured divisions have two armoured and one mechanised brigade, mechanised divisions have one armoured and two mechanised brigades, and infantry divisions have one mechanised and two motorised brigades, in each case with supporting artillery, anti-aircraft and in some cases SSM units. Each brigade contains three regiments. A standard infantry division averages about 12,000 men; armoured divisions have considerably smaller numbers of personnel. Divisions are moved about internally according to changing priorities in internal security and border defence: the 1977 distribution of forces is given under Role, Commitment, Deployment and Recent Operations.

The air force has a squadron organisation, and consists of one bomber squadron, one light bomber squadron, 12 fighter-ground attack squadrons, five interceptor squadrons and one counter-insurgency (COIN) squadron. There are also two large transport squadrons and eight helicopter squadrons, plus a large number of training aircraft. The 10,000 strong Air-Defence component of the air force operates the fixed and mobile SAM units, but not the army's lavish array of anti-aircraft guns and SAM-7s. The principal operational air bases are at Baghdad, at Kirkuk and Mosul in the north, and near Basra in the south.

The navy has the normal organisation of ship and shore commands, all centred at Basra, the site of naval headquarters, and nearby at Umm-Qasr, the main naval port.

RECRUITMENT, TRAINING AND RESERVES

Conscription for 2 years of military service, liability extending for all males from the age of eighteen to forty, has been established in Iraq since 1934. It was only after 1958, however, that the National Defence Law abolished the provision whereby conscripts could purchase exemption from military service, and until quite recently there had been only limited success in applying the law in Kurdish-populated areas. State employees in essential jobs and certain categories of students and religious leaders are entitled to deferment or exemption, but by and large the law is fairly and strictly applied: this largely explains the steady numerical growth of the Iraqi army, which is simply accepting each year the larger number of conscripts produced by the rapidly expanding population.

Induction of recruits normally occurs at the age of eighteen, and after his 2 years of active service the conscript is automatically placed in a reserve status for an additional 18 years. The army also encourages voluntary enlistments for successive 2 year periods, commencing either directly from civilian life or at the completion of conscript service, and enlisted personnel are eligible for pension after 15 years of service or upon reaching the age of forty-five. A substantial proportion of the enlisted strength of the Iraqi army, including almost all NCOs, is made up of these career personnel. Almost all air force and navy personnel are volunteers.

Following basic recruit training, conscripts receive on-the-job training with their assigned units. Most conscripts are of rural background and limited education, but are familiar with firearms; they adapt readily to military service.

For regular personnel, the army maintains service schools for the combat arms, as well as for the technical and administrative services, mostly in the Baghdad area; they provide courses for both officers and NCOs. About 150 Soviet advisers are in the country to assist in training Iraqi troops in the use of the more advanced Soviet weapons in use, and numbers of NCOs as well as officers have been sent abroad for training. After 20 years of primary reliance on the Soviet

Union as arms supplier, Iraqi army tactical doctrines have shifted considerably from the former British model towards the Soviet pattern, although this transformation has been both retarded and to some extent redirected by the fact that most of the army's actual combat experience in this period has been in counter-insurgency operations.

Most army officers are graduates of the Military College, founded in 1924, which is located in the south-western section of Baghdad at Rustamiyeh. Candidates must be secondary-school graduates between 16 and 21 years of age, and must succeed in competitive entrance examinations. In practice the large majority of the 250–300 cadets enrolled each year are Sunni Arabs, and in recent years there has been a concerted attempt to ensure that most are members of the Ba'ath Party associated with the dominant factions within that party. Cadets are divided into two groups, combatant (combat arms) and administrative (the various technical services); they study common subjects during the first 2 years of the course, but specialise according to their branch in the final year. Upon graduation they receive commissions as second-lieutenants in the regular army.

There is also a Reserve College, founded in 1952, which provides separate 1 year courses for conscripts holding secondary school qualifications or academic degrees; the latter course also provides military training for professional specialists such as doctors and legal personnel who join the regular army. About 2000 reserve officers are graduated each year, of whom only a small percentage subsequently serve on active duty for short periods. Those with professional degrees or qualifications receive commissions as second-lieutenants, the remainder as warrant officers.

Air force flying personnel are trained at the Air Force Flying College at Shu'aiba Air Base near Basra, founded in 1950. It also conducts courses for the training of technical specialists. Beginning in 1976 some 30 Iraqi pilots a year were also being trained to fly by the RAF Training Command in Britain, but the recent coolness in Anglo-Iraqi relations may lead to the ending of this agreement.

Company-grade officers receive further training in tactical and technical subjects in the various branch training establishments maintained by the army, and also abroad. Army and air force officers selected for higher command and staff responsibilities attend a 2 year course at the Staff College in Rustamiyeh, founded in 1928, whose curriculum is basically modelled on that of the British Army Staff College at Camberley. Selected Iraqi officers also attend Staff Colleges in the Soviet Union and Britain.

The army's reserves are stated to number about 250,000 men, with graduates of the Reserve College providing an officer reserve as well, but there is no unit organisation for the reserves, nor are they called up for training at regular intervals. Those who have completed active service as conscripts within the preceding 5 years, however, provide an ample reservoir of soldiers with reasonably fresh experience to serve as reinforcements or replacements for existing regular units in an emergency. There are no figures available for air force reserves, but they would not be very numerous.

EQUIPMENT AND ARMS INDUSTRY

The main armoured strength of the Iraqi army is its 1700 T-54/-55/-62 medium tanks, with the latter predominating. It also has 100 old T-34s, 100 PT-76 light tanks and a small number of AMX-30 medium tanks recently acquired from France. Large numbers of tank transporters are in use and further T-62s are on order from the Soviet Union.

About 100 BMP-1 MICVs carrying 11 men, a 73 mm low-pressure gun and an AT-3 Sagger ATGW system, are in service. Amongst the total of 1700 other armoured fighting vehicles the great majority are Soviet BTR-50P and Czech OT-62B APCs. Wheeled APCs include the old BTR-152 and the newer BTR-60P; light reconnaissance duties are performed by BTR-40P amphibious vehicles, some in a special anti-tank version mounting a six-launcher AT-3 Sagger system. There are small numbers of French-built Panhard AMLs and M-3s and some 30 British-built Ferrets, but in the interests of standardisation these are used only in secondary roles.

The artillery arm has 26 FROG-7 surface-to-surface missiles (80 km range) and 12 Scud B SSMs (300 km range). Further Scud Bs are on order. Self-propelled artillery includes 90 SU-100 and 40 ISU-122 SP guns. The remaining 800 artillery pieces, all of Soviet make, are towed: 75 mm and 85 mm guns; M-37 and M-38 122 mm howitzers; modern M-63 122 mm gun/howitzers; M-54/46 130 mm guns; and M-37, M-43 and M-55 152 mm howitzers. The standard mortars are Soviet M-37 81 mm, M-38 and M-43 120 mm, and some 160 mm. Rocket launchers are of the BM-21 122 mm type, carried on URAL-375D trucks.

The main burden of anti-tank defence is now borne by Soviet AT-3 Sagger and French SS-11 ATGWs, but there remain limited numbers of Soviet M-44 100 mm and M-45 85 mm ATK guns. B-10 82 mm and B-11 107 mm recoilless rifles are also in use, and RPG-7 anti-tank rockets are issued to the infantry in large numbers.

The army has a total of approximately 1200 Soviet-made AA guns. There are some of the old-calibre M-44 85 mm and M-49 100 mm AA guns, but the great majority are modern small-calibre automatic weapons: S-60 57 mm cannons in both the single towed and twin self-propelled (ZSU-57-2) versions, M-38/39 37 mm cannons in single and twin towed versions, 23 mm cannon in the twin towed (ZU-23) and quadruple self-propelled (ZSU-23-4) versions, and Vladimirov KPV 14.5 mm heavy machine-guns in twin and quadruple mounts carried on a wide variety of vehicles. The SA-7 Strela man-portable surface-to-air missile is used in large numbers by the infantry. Larger SAMs, including the mobile SA-6s, are operated by the air force.

World Armies

The standard infantry weapon is the Kalashnikov AKM in both the Soviet version and the East German MPiKM version; soft-skinned transport vehicles are about half Soviet, half East German.

The air force has about 339 combat aircraft, of which the majority are Soviet built, with some French and British types. Bomber strength is 12 TU-22 medium bombers and 10 Il-28 light bombers. The five interceptor squadrons are equipped with 115 MiG-21s. Of the 12 FGA squadrons, four fly 80 MiG-23Bs, three have 60 SU-7Bs, three have 30 SU-20s and two have 20 Hunter FB59/FR10s. The one COIN squadron flies 12 Jet Provost T52s. 72 F-1C Mirage fighters and four Mirage F-1B trainers are on order from France, with deliveries scheduled to begin in 1979.

Transport aircraft include 10 An-2s, eight An-12s, eight An-24s, two An-26s, two Tu-124s, 13 Il-14s and two Herons. A number of Il-76 transports are on order from the Soviet Union.

The helicopter squadrons fly 35 Mi-4, 14 Mi-6, 80 Mi-8, 47 Alouette III, eight Super Frélon, 40 Gazelle and three Puma helicopters. There are reports that at least some of these helicopters have been equipped as gunships for use in counter-insurgency operations. Air force training aircraft include MiG-15/-21/-23Us, SU-7Us, Hunter T69s, 10 Yak-11s, 12 L-29s and eight L-39s.

The standard air-to-air weapon is the AA-2 Atoll AAM and the air-to-surface missile is the AS-11/12 ASM. However, R.550 Magic AAMs and Exocet ASMs are on order from France.

The naval component's principal fighting strength is its six Osa-I and eight Osa-II fast patrol boats armed with Styx surface-to-surface missiles. It also has 10 P-6 torpedo boats, three SO-1-class submarine chasers, two large Poluchat-class patrol craft, six smaller coastal patrol boats, five minesweepers (two T-43-class, three inshore) and three Polnocny-class LCTs. All naval equipment is Soviet built.

Army and air force workshops have a considerable maintenance and repair capability, and serviceability rates are quite good by Middle Eastern standards, but apart from this there is no arms industry in the country. The need to import all weapons, spares and even most varieties of ammunition creates a certain vulnerability, which is exacerbated by the fact that over 95% of Iraqi weapons since 1958 have been provided by a single supplier — the Soviet Union. In any conflict on its eastern frontiers, moreover, Iraq would probably be unable to make use of its vulnerable and easily blockaded ports on the Shatt al-Arab, and would be completely dependent on aerial resupply.

In an attempt to diversify its source of arms, therefore, Iraq has increasingly turned to Western suppliers in recent years, and especially to France, with which it has a particularly close commercial relationship (Iraq is France's largest Middle Eastern oil supplier after Saudi Arabia, and there are an estimated \$4,000,000,000 worth of French industrial projects underway in the country). The agreement to purchase 72 Mirage fighters, additional helicopters, and French air-to-air and air-to-surface missiles was concluded during French Prime Minister Raymond Barre's visit to Baghdad in 1977. Baghdad has also engaged in discussions with West Germany about the purchase of a modern radar network for the air force, and with Brazil concerning the acquisition of training aircraft. Much the greater part of Iraqi defence purchasing, however, will probably continue to be from the Soviet Union.

Iraq is a signatory of the Nuclear Non-Proliferation Treaty, but much concern has been expressed in some quarters recently about the kind of fuel that is to be supplied by France for the 70 MW Osiris-type research reactor (Osirak) which is being constructed at Taiwatha in northern Iraq under the terms of the Franco-Iraqi nuclear accord of November, 1975. France is committed to supply 70 kg of 93% enriched uranium by the time the reactor is completed in 1980, and other Western countries have made strong representations to France about this since it would provide Iraq with sufficient quantities of easily extractable weapons-grade uranium to make at least one nuclear bomb. France is now testing an alternative uranium fuel known as 'caramel' for the Osiris-class reactors which is enriched to only 7 or 8% and is thus unsuitable for weapons, but there is considerable doubt as to whether this will be available in commercial quantities by 1980.

RANK, DRESS AND DISTINCTIONS

Ranks in the Iraqi army generally follow the old Ottoman nomenclature, adapted to the British army's rank structure. Insignia of rank are worn on shoulder straps by army and air force officers (air force officers add flight wings at the outer edge of the strap). Naval officers wear gold stripes identical to those of the British Royal Navy. Non-commissioned officers' ranks are shown by black stripes worn on the upper sleeves, with branches of service shown by distinctive emblems, coloured cap piping and collar patches.

<i>Rank</i>	<i>British Equivalent</i>	<i>Insignia</i>
Mushir	Field Marshal	Crossed sabres within olive wreath, Arab eagle towards centre
Muhib	General	Crossed sabres, two stars, Arab eagle
Fariq	Lieutenant-general	Crossed sabres, one star, Arab eagle
Liwa'	Major-general	Crossed sabres, Arab eagle
Zaim	Brigadier	Three stars forming triangle, Arab eagle

'Aqid	Colonel	Two stars in line, Arab eagle
Muqaddam	Lieutenant-colonel	One star, Arab eagle
Rais Awal	Major	Arab eagle
Rais	Captain	Three stars
Mulazim Awal	Lieutenant	Two stars
Mulazim Thani	Second-lieutenant	One star
Naib Dabit	Warrant Officer	Arab eagle on upper sleeve
Rais Urafa Widha	Regimental Sergeant-major	Arab eagle on lower sleeve
Rais Urafa Widha	Company Sergeant-major	Four slanting stripes on upper sleeve
Rais Urafa	Company Quartermaster Sergeant	Three slanting stripes, surmounted by Arab eagle
'Arif	Sergeant	Three slanting stripes
Naib Arif	Corporal	Two slanting stripes
Jundi Awal	Lance-corporal	One slanting stripe
Jundi	Private	—

Promotion of enlisted men is based on recommendations by superior officers, written proficiency examinations and time in grade. Minimum time in grade before promotion is: for privates, 1 year; for lance-corporals, 1½ years; for corporals, 2 years; for sergeants, 2½ years; for sergeant-majors, 4 years; and for warrant officers, 3 years for each consecutive advancement through the eight classes within the rank. Before 1966 all officer ranks had a minimum time in grade of 4 years, but a law of that year permits the President of the Republic to grant up to 3 years' credit to any officer for distinguished service.

Pay and allowances in the armed forces compare favourably with salaries and wages for civilians of similar qualifications. Discipline is very strict, and distinctions between the various ranks are wide. Officers have powers to confine other officers of more junior rank after summary trial, for varying periods depending on the difference in rank, and may even order flogging of enlisted men (three lashes maximum by a captain, seven by a colonel).

Iraqi army officers' uniforms are similar to those of the British army: field uniform of beret or helmet, battledress jacket and trousers, web belt and short leggings; service dress of single-breasted jacket with patch pockets, khaki shirt and tie, and trousers without cuffs; and dress and mess dress uniforms. Except in the field British-style garrison caps are worn, with coloured piping to denote the branch of service, except for the armoured corps, who wear black berets. Winter field and garrison uniforms are olive-drab wool; summer equivalents are in light-tan gabardine or cotton twill. Specialised combat clothing is now mainly of Soviet design.

The highest Iraqi distinction is the Decoration of the Republic, which is granted to soldiers, civilians and distinguished foreigners for services to the nation. The Rafidain Military Medal, in three classes, is awarded to both soldiers and civilians, and is exceptionally presented to foreigners. The Bravery Medal and the General Service Medal are awarded to both soldiers and civilians for outstanding courage and for distinguished service during active military operations or in time of war. There are also campaign medals for the 1941 revolt, the Palestine War, the 1958 Revolution, the 1963 Revolutions and the war against the Kurds (the Medal of the Suppression of the Rebellion in the North), awarded to those who were in military service at the time or participated in the various revolutions.

CURRENT DEVELOPMENTS

Stability has three dimensions in Iraq: the intra-regime factional balance, and especially the civil-military balance; inter-communal relations between the various Iraqi minorities; and Iraq's relationship with the rest of the Arab world. As always, there are serious potential threats in all three areas, but nevertheless the present regime looks more solid and lasting than any in Iraq's modern history.

After the decades of coup and counter-coup which eliminated so many other major groups and parties in the Iraqi *élite*, and a decade of vigilant and ruthless suppression of dissents by the Ba'ath Party, there are no longer any discernible political challengers to the Party's control of Iraq's military and political *élite*. The only other political force permitted to operate within the Arab community, the Communist Party, is closely circumscribed in its activities: it belongs to the National Progressive Front, but has only two members in the Cabinet and none on the high policy-making arm of the government, the Revolutionary Command Council (RCC).

No party except the Ba'ath is permitted to organise political activity within the armed forces (a condition the communists agreed to in 1971), and any rival attempt to do so is instantly detected and crushed: 21 communists were hanged in May, 1978 for attempting to form secret groups within the army. Potential opposition figures are even tracked down abroad. One of two Iraqis awaiting trial in England in late 1978 for the assassination of General Abdul Razzak al-Nayef (briefly Prime Minister as head of the non-Ba'athist military officers who collaborated in the seizure of power in 1968, but then expelled from the country and the government by Ba'athist officers) was Fahad Shaker, the younger brother of Saadoun Shaker, head of Iraqi intelligence and a senior member of the RCC.

World Armies

Within the Ba'ath Party itself, however, the intense and complex factional struggles continue unabated. The Tikriti group, which enjoys a dominant position within both the military and civilian wings of the party, remains securely in control, but even within it civil-military rivalries are a significant factor, and it faces a major problem in the near future in the probable retirement of its head, the ailing President al-Bakr (born in 1914), who has great prestige both in the army and amongst the civilian *élite*. His heir apparent, Saddam Hussein, despite his conscientious cultivation of support within the armed forces and his assumption of a military rank, is seen by senior professional soldiers as an irredeemably civilian figure, and his ally, the new Defence Minister Khairallah Talfah, does not have al-Bakr's prestige in the army.

The exceptional secretiveness of the regime renders it opaque so far as the details of factional manoeuvres are concerned, but it is clear that the civil-military struggle is heating up as the departure of President al-Bakr approaches. For most of the past decade the stronghold of the generally more moderate military wing of the party has been the Revolutionary Command Council, while the Ba'ath Regional (Iraqi) Command has been dominated by the radical civilian factions within the party. Five officers formed the first RCC in 1968; some civilians were subsequently introduced, but after successive purges the RCC had again been reduced by mid-1977 to President al-Bakr and one other original member, plus Saddam Hussein and two other new members both of whom had served the President in a military capacity. In September, 1977, however, all 15 full members of the Ba'ath Regional Command plus two candidate members (almost all civilian) were added to the RCC, giving it a decidedly civilian flavour.

This should not necessarily be taken as a decisive shift of power, although the military wing is clearly on the defensive and feels particularly threatened by Saddam Hussein's policy in recent years of introducing *en masse* a new generation of young Ba'athists, loyal to himself, into the officer corps, where they are gradually rising in rank. The execution of 21 communists in 1978 on charges of infiltrating the army (some of whom had been convicted as long ago as 1975) may well have been a warning to the radical civilian wing of the party not to seek an alliance with the Communist Party against the military wing. The outcome of a civilian-military showdown is entirely unpredictable now, given the civilian wing's allies in the junior ranks of the officer corps and its control over the 75,000 strong and well armed party militia, the People's Army.

The second dimension of stability, that of the relations between the various minority communities of Iraq, is easier to assess. The Sunni Arabs are securely in charge, there is no discernible separate political organisation for the Shi'ite community at all, and one faction of the Kurdish Democratic Party is included within the National Progressive Front. It is unlikely that the pro-government part of the KDP accurately represents the feelings of more than a significant minority of Kurds, but after the total defeat of 1975 and the subsequent drastic measures taken by Baghdad, a renewal of the Kurdish revolt on a similar scale is improbable in the near future. Most of the renewed fighting in the north (spilling over into Turkey's Kurdish areas as well) in 1977-8 appears to have been between rival Kurdish factions, and even if the KDP did establish its dominance by mid-1978, as has been reported, a really serious renewal of the Kurdish war would not be possible without major outside support. There have been suspicions in Baghdad of Turkish, Iranian and even Soviet support for the Kurds during the past year, but there is no evidence that this is the case.

The case of the Shi'ite Arabs of the south is similar: without external support no really serious trouble is to be expected. The potential is there in terms of dissatisfaction and resentment amongst the Shi'ite population: there were major riots in the Shi'ite holy cities of Najaf and Karbala in February, 1977 which were promptly and bloodily suppressed by the army. Baghdad's main anxiety, however, was that an ultra-nationalist regime of strongly religious character would supplant the Shah in neighbouring Iran. The Shah's departure into exile in January, 1979 means that this is still a possibility. If there is encouragement and support for Iraqi Shi'ites from the new government in Shi'ite Iran, then the present Baghdad regime could face a problem fully as serious as the recently ended Kurdish revolt — especially since there would be a strong likelihood that it would have to face both problems at once.

In the third principal dimension of survival — its international relations — the Iraqi regime currently enjoys an unusually favourable situation. For the first time since the 1958 revolution Iraq has no major dispute potentially involving a military confrontation with any of its neighbours. The last such dispute, with Syria, was ended in October, 1978 by a spectacular reconciliation aimed at creating a joint 'Eastern Front' against Israel to make up for the loss of Egyptian military support. Moreover, it now has formally correct relations with every single Arab regime except Egypt, and has at least for the moment ceased to support the campaign of assassination against moderate elements within the Palestine Liberation Organisation that was waged by radical Iraqi-based Palestinian groups through most of 1978.

The present inter-Arab cordiality will last only so long as no Arab regime breaks ranks and approves Egypt's peace policy, however, and Iraq's reconciliations with Syria and Iran must both be reckoned fragile. Renewed hostility towards Syria is perhaps the likelier of the two, but would not expose the regime to serious danger. The probability of major battles on the Iraqi-Syrian frontier has always been small, despite the repeated alarms of the past decade, since neither side would willingly commit large forces to combat there: Syria's principal defence concerns are at the other end of the country, on the Israeli frontier and in Lebanon, while Iraq's are along the Iranian border and in Kurdistan. A new confrontation between Iraq and the newly formed Iranian regime would be a more serious military threat, but would be likely to take the form of internal security operations against revolts receiving Iranian encouragement rather than of large-scale combat operations on the Iranian border.

The Iraqi army's ability to contain such internal revolts, if not to suppress them entirely, is not in doubt. It now has a homogeneous and professionally well-qualified officer corps with very extensive experience of counter-insurgency

operations. It is hard to imagine that even the most severe factional rivalries within the Ba'ath Party would be permitted so to disrupt the armed forces as to jeopardise the existing structure of power in the country.

As a fighting force in high-intensity conventional combat of the sort experienced in Arab–Israeli wars, however, the Iraqi army has scarcely been tested at all. Due to its distance from the 'Eastern Front' its expeditionary forces have always arrived too late in a war to choose their own dispositions, and have been thrown into combat piecemeal straight off the line of march with generally unimpressive results. Should the proposed Syrian–Iraqi unified military command ever come into being, this traditional handicap might be avoided by stationing Iraqi troops near the front in peacetime, but Syria's tolerance for very large Iraqi forces on its soil must be reckoned to be as slight as the likelihood that Iraq could permanently spare more than, say, two or three divisions from their normal internal security and external defence duties at home.

GWYNNE DYER

IRISH REPUBLIC

HISTORY AND INTRODUCTION

The Irish Defence Forces, which consist largely of the army, with an integral air corps and naval service, see their origins in the Irish Volunteers, founded in Dublin in November, 1913 by Professor Eoin MacNeill of the Gaelic League. The foundation was open and indeed perfectly legal, under the current United Kingdom legislation governing volunteer forces, which had been enacted to regularise the spontaneous creation of the Volunteer Rifle Corps of 1859. It was also under that legislation that the Ulster Volunteer Force (U.V.F.) had been founded in the northern counties the previous year. But, just as the U.V.F. had been founded to offer physical resistance, if necessary, to the imposition of the Irish Home Rule Bill ('Ulster Will Fight and Ulster Will Be Right'), by no means a purpose which the volunteer legislation had been designed to countenance, the foundation of the Irish Volunteers had a local political purpose: to counterweigh the U.F.V. and threaten the Westminster parliament with armed resistance if the Home Rule Bill were not enacted. It was only to the first of these intentions that MacNeill, the mildest of intellectuals, was dedicated; but the second was the real intention of his fellow committee members, whose loyalties lay towards the underground and revolutionary Irish Republican Brotherhood (I.R.B.).

Though hidden from the British, the I.R.B. connection became apparent to the leader of the constitutional Irish National Party, John Redmond, M.P., who managed to secure a controlling position within the Irish Volunteers and, on the outbreak of war in 1914, to lead the vast majority of its members (170,000 out of 180,000) into support for the British war effort. His belief was that a demonstration of loyalty would guarantee the grant of Home Rule (enacted but postponed after hostilities) after the war. The I.R.B. and the other extreme nationalist groups, including the tiny socialist Irish Citizen Army, took the contrary and time-hallowed view that 'England's difficulty was Ireland's opportunity' and prepared for rebellion. Their plans were discovered and countermanded by MacNeill, at the moment they were to strike in Easter week, 1916, but the Military Council of the I.R.B., meeting in Liberty Hall, Dublin, headquarters of the Irish Citizen Army, on Easter Sunday, April 23rd, decided nevertheless to proceed and the following day seized key points in the city with the handful of Irish Volunteers who answered their call, and the Irish Citizen Army. In all their force numbered 1200 and after a week's fighting their resistance was overcome.

The rising had not been popular in Ireland, but the execution of the leaders by the British turned opinion in their favour. Demand for full independence became widespread and in the 'khaki' election of December, 1918 for the United Kingdom parliament the majority of the candidates elected for Irish constituencies were nominees of *Sinn Féin*, the nationalist umbrella organisation. They refused to go to Westminster and met in Dublin, where they proclaimed themselves to be *Dáil Éireann* (the Irish parliament) and the legitimate government of Ireland. The Irish Volunteers, who came after August, 1918 to be known as the Irish Republican Army, were regarded as its armed force.

However, though the I.R.A.'s Chief of Staff, Richard Mulcahy, and Director of Intelligence, Michael Collins, were members of the *Dáil*, and Collins indeed its Minister of Finance, the I.R.A. was not under its direct control, either formally or, worse, practically. Éamon de Valéra, the Prime Minister, defined the relationship in April, 1919 thus: 'the Minister for Defence (Cathal Brugha) is of course in close association with the voluntary military forces which are the foundation of the national army'; but it was not such a close association that it could prevent individual I.R.A. groups taking independent action against the British army or the Royal Irish Constabulary. It was, in fact, an unauthorised killing of two constables at Soloheadbeg, County Tipperary, on January 21st, 1919, the day of the *Dáil's* first meeting, which precipitated the outbreak of open war between the nationalist movement and the British government and army.

The war lasted until July, 1921 and caused the deaths of about 600 soldiers and policemen, and 750 Irish people, mostly I.R.A. men. The I.R.A.'s armed strength never exceeded 3000, the British army's deployed strength being about 50,000, besides the R.I.C. and its emergency-raised forces, the 'Black and Tans' and the Auxiliaries. Michael Collins later admitted to the British that at the end his forces were almost beaten, but the war ended with a truce and negotiations for a treaty. Its terms were for sovereignty of an Irish Free State of 26 of the 32 Irish counties, within the British Commonwealth, something less than the all-Ireland republic of which the *Dáil* claimed to be the government. Many of its members, including de Valéra, declared their unwillingness to settle for less and, after a general election in June, 1922 had returned a pro-treaty majority, left the *Dáil*. The I.R.A. split along pro- and anti-treaty lines, occupied key points in various cities and in late June opened hostilities against each other. The pro-treaty faction, armed by the British and with the machinery of government behind it, quickly got the upper hand, but the campaign then resolved itself into guerrilla war and was not ended until July, 1923, and then principally by the implementation of a ruthless policy of reprisals: 77 anti-treaty prisoners were executed without trial by the Free State government.

Its army, founded on the pro-treaty faction of the I.R.A. but swelled by volunteers, had by then reached a strength of over 50,000, from which figure it was gradually run down in the first three years of peace, though not without difficulty; in

March, 1924 a mutiny broke out among discontented officers, disgruntled both by the turn of political events inside the country and the terms of demobilisation, though more strongly by the latter, and it had to be settled by a mixture of force and bribes. Strength gradually fell from 15,000 to 11,000 in the mid-1920s but in 1930 had fallen to about 5000, near which it remained until the outbreak of World War II.

That the government felt obliged to retain a conventional army in being, while it also maintained a large and efficient national police force, was protected by the Royal Navy (which enjoyed the use of certain Irish ports until 1938), and consistently pursued a non-aligned foreign policy, cannot wholly be explained by reference to the argument that an army is one of the outward marks of sovereignty cherished by newly established states. The nationalist movement had always rested its case for nationhood upon a more abstract foundation, that of distinctive Irish culture, language and morality, and had carried this case forward into independence (under which the propagation of the Irish language in the public services — including the army — and its compulsory instruction in schools became one of the minor irritants of everyday life). The Free State's maintenance of its army in being is really explained by the underground survival of the anti-treaty guerrillas, who continued to call themselves the Irish Republican Army, who denied the legality of the Irish Free State, mounted violent attacks on its officials and claimed in some sense to represent legitimate power in Ireland. The I.R.A. called itself, in Irish, *Oglaigh na hEireann*, the title of the Irish Volunteers, which was also that borne by what it called the 'Free State Army'. That army was not needed to repress the I.R.A., for which the police (*Garda Síochána*) was a match, and indeed the government was at some pains to exclude it from anti-I.R.A. operations, for fear that by involving it some semblance might be given of a civil war still in progress. Thus the army principally existed to deny the claim of the I.R.A. itself to be the Irish army and to represent the pure spirit of nationalism — a claim which it maintained all the more strongly after de Valéra led the political Republicans into parliamentary life in 1927 (under the confusing party title of *Fianna Fáil*, Soldiers of Destiny, a monogram of which formed part of the Irish Volunteers' (and therefore also the Irish Free State Army's) badge. The election of *Fianna Fáil* to power in 1933 damned it for good in the eyes of the I.R.A., which in December, 1938, by a tortuous process of legal argument, declared itself to have inherited the sovereign power of the second *Dáil* and its 'Army Council', therefore to be the legitimate government of the Republic of Ireland.

Its activities had constantly invoked the State's use of emergency powers against it, particularly in the mid-1920s and early 1930s, but after the assumption of its claim to represent sovereign and legitimate power in the land, the organisation was swiftly declared unlawful (August, 1939). It was then conducting a campaign of terrorist explosions in Britain and, on the outbreak of war, when the Irish Free State (since 1937 *Eire* or Ireland) declared its neutrality, most of its more active members in Ireland were arrested and interned. It seemed thereafter destined to fade into obscurity. During the war, meanwhile, the Irish Defence Forces rose to almost the strength they had had during the civil war, while at least 50,000 citizens served in the British forces. An important element of the forces were the Volunteers, a force formed by the *Fianna Fáil* government in 1934 to provide a deliberate counter-attraction to the I.R.A. among young men of military inclinations in the countryside; the I.R.A. itself admitted that it very greatly diminished their recruiting.

After the war, the army was reduced again to a strength of about 11,000, with the pre-war Volunteers and the war-time Local Defence Force consolidated as a volunteer reserve known as the *Forsa Cosanta Aitiúil*, 37,000 strong. The army had proved itself by now an efficient and trustworthy force, generally acceptable to the population at large. If it had faults, they were those of the country itself: poverty, provincialism and lack of opportunity. Because Irish citizens, even after the State's departure from the Commonwealth in 1948 (when it became 'The Republic of Ireland'), continued to be treated for almost all purposes as British citizens when resident in Britain, to which they had unrestricted right of entry, and because pay, conditions of service and opportunities for foreign travel were all better in the British army, it was the British army rather than the Irish army which most Irish would-be soldiers thought of joining first (or sometimes second — about 7000 men deserted from the Irish forces to join the British during World War II).

During the 1960s two developments impinged to vary the routine of Irish army life. The first was United Nations duty, first in the Congo, where two specially formed battalions served between 1960 and 1964, and later in Cyprus and Egypt. The second, less happy, was the violent political upheaval in Northern Ireland. The Irish government has shown itself as anxious as always to deal with such political violence as the emergency has caused within the Republic itself through the police, but the army has nevertheless to some extent been drawn in. At the outbreak, in 1969, when many northern Catholics took refuge from Protestant violence in the Republic, the Irish government, in order to demonstrate its concern, opened army camps to the refugees and sent medical units to the border. The resurgence of the I.R.A., which moved swiftly to profit from the troubles, and the finding of evidence in 1970 that some officers of the intelligence branch had assisted in gun-running into the north, with the approval of some strongly nationalist members of the *Fianna Fáil* party then in power, aroused the government's old fears for the army's political purity. Two battalions were formed for duty on the border, in testimony of the government's determination to maintain law and order on their territory (whether threatened by the I.R.A. or by intruding northern Protestant terrorists), but they were instructed to act only 'in aid of the civil power', which meant under the direction of the police. It seems that fears of provoking even the appearance of a renewal of civil war, which the spectacle of Irish soldiers firing on Irishmen might give, remain as strong as ever.

Despite recent enlargements of its role, and much improved pay and conditions of service, made possible by the successful management of the Irish economy over the last two decades, the lot of the Irish army is not therefore altogether a happy one. The Irish are an extremely military people. Their ancient literature, resurrected by nationalism and a powerful ingredient of their political myths, is one of warrior sagas. For several centuries, from the 16th onwards, they provided

World Armies

European armies with a constant supply of soldiers, many of whom made glittering military reputations. At times they have furnished almost half the strength of the British army (and they formed almost the whole of the strength of the East India Company's European Regiments). This mercenary service was largely forced upon them, for want of economic and social opportunity at home, but it has left its marks. One of these is the existence of competing military traditions: that of the British army itself, and that of the 'wild geese' of the emigration, as well as that of the post-independence Irish army, to which must also be added the sinister but thrilling tradition of the underground I.R.A. It is difficult therefore for the Irish army to present itself as a central national institution, and it is praiseworthy that it should have sustained its difficult role over 50 years as successfully as it has.

STRENGTH AND BUDGET

Population: 3,200,000

Army: 13,370; reserves, 490; volunteer reserve (*Forsa Cosanta Aitiuil*), 18,175

Navy: 570; six small warships

Air force: 710; 16 combat aircraft

GNP (1976): \$8,100,000,000

Defence expenditure (1977): \$146,000,000

For the greater part of the State's existence, the defence budget has been very small, both absolutely and as a proportion of government expenditure. In 1965 it stood at only £10,000,000, and represented a little over 1% of GNP, about the lowest figure for national defence expenditure in the developed world. Almost all the money went on personnel and maintenance costs. Under the pressure of the Northern Ireland situation, the government has considerably increased defence expenditure, both to acquire badly needed new equipment and to add to the numbers in the armed forces. Nevertheless, expenditure remains below 2% of GNP and the bulk continues to be spent on man-power costs rather than procurement. This is understandable, for the armed forces' need for expensive equipment is limited by their essentially internal security role.

COMMAND AND CONSTITUTIONAL STATUS

The legal basis of the Irish army's foundation lay in Article 46 of the Irish Free State's Constitution, which conferred on the *Oireachtas* (the *Dáil*, lower house, and Senate) the exclusive right to raise and maintain an armed force, which was given statutory force by the Act to make Temporary Provisions in Relation to the Defence of *Saorstát Éireann* (Irish Free State), passed on August 3rd, 1923; the army was actually established (though of course it was already in existence) by Proclamation of the Executive Council (cabinet) on October 1st, 1924. The Defence Forces (Temporary Provisions) Act of 1924, annually re-enacted, remained the basis of military legislation until 1954, when the Defence Act was passed; amended in 1960, to allow the despatch of contingents outside the national territory for United Nations duty, and supplemented by Regulations issued under it, it continues to govern the command, organisation, military law and discipline of the armed forces.

The President (*an tUachtaran Éireann*) is also Supreme Commander; under his direction, military command is exercised by the government through the Minister for Defence. He is assisted and advised by the Council of Defence which consists of two civil members (the Parliamentary Secretary to the Minister and the Secretary of the Department of Defence) and three military members (the Chief of Staff, the Adjutant-General and the Quartermaster-General). These last two officers are Heads of the Personnel and Material Branches of the Military Staff, respectively. The Chief of Staff (*an tAire Cosanta*), assisted by Directors of Intelligence, Operations, Training, and Planning and Research, is the executive commander; he also (not the Adjutant-General) is responsible for officers' appointments and promotions. The Directors of the corps form the Technical and Supply Staff on the Military Staff; Artillery, Cavalry and Signals work to the Chief of Staff; Medical and Military Police work to the Adjutant-General; and Engineers, Ordnance and Supply and Transport work to the Quartermaster-General. The Commanders of the Air Corps and the Naval Service act directly under the Chief of Staff.

The discipline of the army is governed by its own code of military law, administered by the Judge-Advocate-General. During periods of political violence, the government has also used military officers as judges in a military tribunal to try cases of terrorism, when intimidation of witnesses, juries and civil justices made the normal legal processes inoperable. It sat in 1931, 1934 and during World War II, and had powers to intern and to impose capital punishment, during the latter period without right of appeal against its verdicts.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

The official handbook of the Irish Defence Forces describes the army as 'defensive in title and in primary mission'; and it is

indeed difficult to visualise circumstances in which it would need (or be able) to perform any but a defensive role. Another, though unmentioned, task, however, is to protect the government against armed attack from within the State, as well as to act, as is normal, as its ultimate guarantor. The army (still 'The Free State Army' to extreme Republicans) had its origins in insurrection and civil war, some of the losing party to which still do not regard it as over, and the army exists in some sense therefore chiefly to prevent a recurrence. During the current troubles in Northern Ireland it has, besides mounting border patrols, also taken part in the suppression of terrorist incidents within the Republic, provided explosives experts to defuse terrorist bombs, and prison perimeter guards to prevent the violent liberation of Republican convicts.

Commitment

Ireland's neutrality precludes the commitment of her army to any alliance. In 1960, however, the current Defence Act was amended to allow contingents to be sent outside the national territory in order to take part in United Nations emergency operations 'of a police character'; contingents and observers have subsequently been so sent.

Irish officers regularly attend the American, West German and British staff colleges.

Deployment

Since 1924 there have existed three Commands: Eastern (HQ Dublin) corresponding roughly to the province of Leinster; Western (HQ Athlone) corresponding to Connaught; and Southern (HQ Cork) corresponding to Munster (the boundaries do not in fact exactly follow either the boundaries of the provinces or their constituent counties). The Curragh Camp, formerly the British army's centre in Ireland, has the status of a separate Command, and contains most of the army's schools and central services. In each of the three territorial Commands are located two brigades: in Eastern, the 2nd and 6th; in Western, the 4th and 5th; in Southern, the 1st and 3rd. Each brigade consists of three infantry battalions, an artillery regiment and a company-sized unit of the other arms. Most of the units, however, are of the volunteer reserve (F.C.A.). The most important of the few regular units are: the 2nd and 5th Battalions (Dublin, Eastern Command); the 1st (known as the 'Gaelic-speaking' battalion) and 6th Battalions (Galway and Athlone, Western Command); and the 4th and 12th Battalions (Cork and Limerick/Clonmel, Southern Command). The 3rd Battalion is at the Curragh and two newly raised border-patrol battalions, the 27th and 28th, are based in Counties Monaghan and Donegal respectively. Of the F.C.A. battalions, the 7th–10th and 20th–21st are in Eastern Command, the 16th–19th and 24th in Western Command and the 11th–15th and the 22nd–23rd in Southern Command. Most of the F.C.A. units are probably well below strength.

Recent Operations

The army mobilised during World War II and has contributed battalions and observers to United Nations peace-keeping forces: the 32nd and 33rd Battalions (now disbanded) in the Congo, 1960–5; a battalion in Cyprus intermittently since 1964; a battalion in Egypt, 1973–4. It now maintains a strong guard on the border with Northern Ireland. The I.R.A., however, avoid action with it and, apart from minor incidents, it has not therefore been engaged in anti-terrorist activity. Its last major operations were conducted in the civil war of 1922–3.

ORGANISATION

Arms of Service

These are, in order of precedence: Infantry (in Gaelic, *Cor Coisithe*), Artillery (*Cor Airtleire*), Cavalry (*Cor Marcra*), Engineers (*Cor Inealltoiri*), Signals (*Cor Comharthafochta*), Ordnance (*Cor Ordanaís*), Supply and Transport (*Cor Solathair Agus Iompair*), Medical Corps (*Cor Liachta*), Military Police (*Cor Poilíní Airm*) and Air Corps (*Aer Cor*); the Naval Service and the Observer Corps also form part of the unified Defence Forces. The reserve force, largely voluntary, is known as the *Forsa Cosanta Aitiúil* (F.C.A. — The Reserve of Men). There are nine regular infantry battalions (*Chathlán Coisithe*) numbered 1–6, 12, 27 and 28, and 17 F.C.A. numbered 7–11 and 13–24. Other units take their numbers from that of the brigade to which they belong, e.g. the 2nd Artillery Regiment belongs to the 2nd Brigade.

Operational

The army is organised into six brigades (though it is doubtful if it would so operate), numbered 1–6. The paper establishment is orthodox, with three infantry battalions of three companies, one artillery regiment of three batteries, one signals company, one engineer field company, one motor squadron of four troops, one supply and transport company, and one military police company. Three brigades, however, are wholly F.C.A. (Volunteer Reserve) and one battalion in each of the regular brigades (1st, 2nd and 4th) is also F.C.A. Of the six artillery field regiments, three are wholly F.C.A. and only one battery in each of the other three is regular. Roughly the same ratio of regulars to volunteer reservists applies in other

World Armies

units. The Irish infantry battalion, the most numerous regular unit, is rather small by NATO standards: it has only two rifle companies and a support company and an established strength of about 500. All in all, it seems probable therefore that the 'operational' organisation of the army is really a 'garrison' one; it is significant that for genuinely operational tasks, in the United Nations Emergency Force and for duty on the border with Northern Ireland since 1969, the Irish army has raised *ad hoc* battalions numbered 32–33, 25–26 (now disbanded) and 27–28, respectively.

RECRUITMENT, TRAINING AND RESERVES

Recruitment of all ranks of both the Regular Army and Volunteer Reserve is by voluntary enlistment; conscription has never been imposed during the State's history (and Ireland was exempted from the conscription laws imposed in Britain during World War I, as indeed Northern Ireland was during and after World War II). Soldiers may enlist between the ages of seventeen and thirty-two (thirty-eight if they have previous service) for an initial term of 3 years, extendable to 3, 4, 6 or 9 years. Thereafter, re-engagement is permitted to allow service of 21 years, extendable by 2 year re-engagements to 31 years. The army is characterised by long service; in 1974 one man in three had 12 years' service and one in six had 20 years'; half those reaching the rank of company sergeant or company quartermaster sergeant had between 13 and 21 years' service.

Recruits undergo a basic training course of 16 weeks at the General Training Depot at the Curragh Camp, Kildare, where 13 of the army's 17 schools are concentrated. He completes his training with his unit. Specialist training in the school of his corps is carried on at the Curragh, as is the training of potential NCOs. Those so trained are promoted to corporal within their units, and then to higher ranks, as vacancies arise. The only schools not in the Curragh area are those of Ordnance, Music, Catering and Equitation, all of which are at Dublin.

Officers are recruited by competition from young men aged seventeen to twenty who must hold the school leaving certificate. They are trained for 2 years in the Cadet School of the Military College at the Curragh and, since 1969, complete their education at University College, Galway, from which they graduate with a degree. The officer's further training in the school of his corps takes place in his first year of service and then in his fifth, on promotion to captain. All officers in their fifteenth year attend the 9 month Command and Staff Course at the Military College. Promotion from the rank of captain is by selection; there is a compulsory retiring age of fifty-four for captains up to sixty-three for major-generals. Long service is the rule and promotion is slow.

Reserves consist of the Reserve of Officers and the Reserve of Men, First Line — ex-regulars who have an annual training commitment of 14–21 days' service, but which, because of the long regular service common in the army, totals only 700; and the Volunteer Reserve, *Forsa Cosanta Aitiuil*, about 16,000 strong. It provides (besides artillery batteries, signal and engineer companies and the like) 17 infantry battalions distributed by platoons and companies throughout the Republic as follows: the 24th Battalion, for example, in Donegal has companies in Letterkenny, South Donegal, Inishowen and North Donegal; the 20th Battalion, in Dublin, has an Irish-speaking company, *Complacht na bhFian*, and a student company, named after Patrick Pearse (a Gaelic scholar and one of the heroes of the 1916 Rebellion).

EQUIPMENT AND ARMS INDUSTRY

Ireland has no arms industry (though there is a light-aircraft factory outside Dublin and the Naval Service's newest ship, *Deirdre*, was built in the Irish yard of Verolme, Cobh, Cork). Military equipment is imported, traditionally from Britain, though more recently some from Sweden and France.

Pistol: 9mm Browning FN

SMG: 9mm Carl Gustav (Sweden)

Rifle: 7.62mm FN (British-made)

Machine-gun: 7.62mm GPMG (Britain)

Mortar: 81 mm (Swedish, Stokes-Brandt) and 120 mm 41c (Finnish, Tampella; 72 in service)

Anti-armour weapons: 84 mm Carl Gustav RCL (Sweden; 477 in service) and 90 mm 1110 RCL (Sweden; 96 in service)

Air-defence weapons: 40 mm L/60 Bofors gun (British-made; 26 in service)

Artillery: 25-pounder gun—howitzer (British, obsolete; 48 in service)

Armour: AML 60 and AML 90 armoured cars (France; 42 in service), Panhard VTT M3 APC (France; 50 in service) and Unimog APC (Switzerland; 10 in service). The army also possesses some obsolescent or obsolete equipment, including Landsverk armoured cars and Comet tanks, the latter being used for training only

Aircraft: six Super Magister, 10SF-260W, four Chipmunk and eight Cessna FR-172H light aircraft; one King Air and one Dove transport; eight Alouette III helicopters

RANK, DRESS AND DISTINCTIONS

General	Crossed swords inside a wreath, three pips
Lieutenant-general	Crossed swords inside a wreath, two pips
Major-general	Crossed swords inside a wreath, one pip
Colonel	Crossed swords, two pips
Lieutenant-colonel	Crossed swords, one pip
Commandant	Crossed swords
Captain	Three pips
Lieutenant	Two pips
Second-lieutenant	One pip
Sergeant-major	Two bars
Battalion quartermaster sergeant	One bar
Company Sergeant	Three wavy chevrons, army badge over
Company quartermaster-sergeant	Three wavy chevrons, specialist badge over
Sergeant	Three wavy chevrons
Corporal	Two wavy chevrons
Acting corporal	One wavy chevron

Partially trained and fully trained privates wear two and three stars on the sleeve, respectively; rank badges of officers and the two senior NCO ranks are worn on the shoulder strap, and of the other NCOs on the upper sleeve. Officers' badges are in metal, other ranks in red cloth; generals wear red gorget patches.

The Irish army's uniform has always closely resembled the British, as did that of the few Irish Volunteers who fitted themselves out in uniform style. A few deliberate distinctions have from time to time been adopted — at first, officers wore a pistol in a low-slung holster, and during the 1930s the whole army wore the German coal-scuttle helmet — but today the uniform is scarcely distinguishable from the British army's, except for its greenish shade. Service dress, pullover order and combat kit are the main orders of dress. Officers wear a peaked cap and Sam Browne belt with service dress. Other ranks wear a black beret, and the Cavalry Corps a loose beret with trailing ribbons, wrongly called a 'glengarry'.

CURRENT DEVELOPMENTS

The prolonged trouble on the border with Northern Ireland has not, after 9 years, involved the army, and the I.R.A. seem content to avoid a confrontation or even an encounter with the forces deployed there. Until the British and Irish governments agree on joint security arrangements of an effective sort to curtail cross-border terrorism, it seems unlikely that the role of the Irish army will alter much from its current one of maintaining a presence in the trouble area.

JOHN KEEGAN

ISRAEL

HISTORY AND INTRODUCTION

'The army of Israel was established by decree on May 26th, 1948, 12 days after the Declaration of Independence. This was a formality. The creation of the army had preceded and made possible the birth of the new State, whose allotted territory was invaded by the regular forces of five Arab States on the first day of its independence' (E. Luttwak and D. Horowitz, *The Israeli Army*, Allen Lane, 1974). Tendentious though Arab (and particularly Palestinian Arab) readers would find this statement, it fairly summarises in Israeli eyes the role which their armed force, *Zahal*, played in the formation of their State and the reason why it remains, in many respects, the most important of their national institutions. For the creation of a Jewish State in *Eretz Israel* ('the land of Israel'), even if short-lived, would in itself have been a realisation of the Zionist dream. But *Zahal* has done more than bring that about. In three subsequent wars it has consistently defeated the armies of its Arab neighbours and in the second of them more than doubled the area of territory under Israeli control. It has helped to turn several hundred thousand immigrants into Hebrew-speaking citizens. Its victories have immensely enhanced Israeli national and Jewish ethnic self-esteem, and it has done all of this — or so Israelis would claim — without compromising the egalitarian, internationalist, even pacifist, ideals on which Zionism was founded.

The pacific inclinations of the original Zionist settlers, who came to Palestine in the 1880s, are generally admitted. Many indeed had come to escape military service in Russia, where conscripted Jews were treated with particular indignity and harshness, and wanted only to live out quiet lives in the Old City or on the agricultural settlements supported by philanthropists like the Rothschilds and Montefiores. However, the second *aliyah* (wave of immigration), which began to reach Palestine in 1904, was composed of Jews with more positive and potentially more disruptive aims. It was not simply that they had imbibed the ideas of Herzl's *Judenstaat* (1897), from which Zionism derived its modern political objective: 'a publicly recognised, legally secured home in Palestine for the Jewish people'. They were mainly socialists from eastern Europe, which housed the largest Jewish population in the world, but one sunk in ignorance and poverty, and they also believed that the salvation of their race lay in the creation of a genuine Jewish working class, of which they were resolved to make themselves the first members. Initially committed to the principle of day-wage labouring, since they shunned the idea of property owning and thought manual labour a good in itself, they were shortly persuaded that the reality was politically self-defeating. The hardships it entailed threatened to kill the strongest of them and drove the weaker back into the diaspora. They turned, therefore, to a new idea, that of the *kvutza*, the communal settlement, which might be co-operative (the *moshav*) or fully collective (the *kibbutz*) but which in either form seemed to offer the means to realise in full their Socialist-Zionist ideals: 'conquest of labour', as the idea of salvation through work was called; 'conquest of the land' (it was an important Zionist belief that the decay of much of Ottoman Palestine into desert and swamp was the consequence of the Jews' expulsion and could be reversed only by Jewish immigration); and a centre of attraction for that immigration itself.

The third *aliyah* which, encouraged by the British government's war-time promise of support in the establishment of a national home (the Balfour Declaration), began to arrive in Palestine in 1919, was committed in advance to the *kvutza* idea. But its numbers, eventually about 40,000, and the apparent favour they enjoyed from the new British administration governing under mandate from the League of Nations, brought to a head the trouble promised by the programme of the second *aliyah* yet hitherto ignored or denied by all but a handful of Zionists: conflict of interest with the indigenous Arabs. They, resentful of the newcomers' competition for employment and fearful that land sold to Jews was lost to Arabs for good, initiated attacks on isolated communities of the *yishuv* (as the Jewish population called themselves) which resulted in several deaths. Police action put the violence down and a local slump calmed passions by halting and even reversing the tide of immigration. But violence flared up again briefly in 1929, perhaps at the instigation of the Arab leadership, and in 1936, after 90,000 fugitives from Nazi anti-semitism had entered the country in 2 years, it erupted in a full-scale Arab revolt, which was not to be extinguished for 3 years.

The Zionist response to Arab hostility expressed itself in three voices. The 'official' view, propagated by the World Zionist Organisation and the Jewish Agency (the semi-official government of the *yishuv*) was that it would be short lived, for Jewish immigration could only increase the prosperity of all Palestinians and therefore foster harmony between them. The 'practical' Zionist view was that it was regrettable but must be borne, since Jews were accepted nowhere in the world and could best find a *modus vivendi* by asserting their identity and their rights, and merely heightened hostility to themselves by seeking to placate and accommodate. The 'revisionist' Zionists, a right-wing minority, went much further: they argued that the plight of the Jews internationally was much greater than that of the Arabs locally, that the Arabs had therefore no right to resist immigration, and that the Jews must overcome any resistance they offered by swamping them with numbers.

These views determined what military response the *yishuv* made to the Arab revolt. The Jewish Agency jointly organised

with the British an official Jewish Settlement Police for the purely static defence of the more threatened *kvutzot*. The Labour-Zionists raised through *Haganah*, their part-time militia which had existed intermittently since 1920, a rather more aggressive force, *Fosh* (Field Companies), which was available for service away from home. The revisionists, disdaining *Haganah*'s doctrine of *havlagah* (self-restraint), formed an illegal national military organisation (*Irgun Zvai Leumi* — I.Z.L.) which carried out reprisals and practised terror on its own account. None of these forces, however, not even the Special Night Squads of the Settlement Police trained by the gentile Zionist Orde Wingate, a serving British officer, contributed much to the defeat of the revolt, which was effectively curtailed by the granting of political concessions to the Arabs.

The principal concession, a virtual halting of Jewish immigration, might have transformed the Arab revolt into a Jewish one, had not the outbreak of World War II compelled the Jews to co-operate in working for a British victory. A persistence in the policy of restricted immigration after the war was over, did in fact bring such a revolt on and prompted the British, after 2 years' unsuccessful effort to repress it, to announce their intention of surrendering the mandate and withdrawing their garrison. The United Nations, inheritors of the League's responsibilities, voted to partition the country, though lacking any means to enforce the decision, and in December, 1947 in anticipation of the independence which was to take effect on the following May 15th, open war broke out between the Jewish and Arab inhabitants.

Historians of *Zahal* now make much of its military ancestry: of *Hashomer*, the romantically bandoliered protectors of the villages of the second *aliyah*; of the Zion Mule Corps which served on Gallipoli and the Jewish Legion (38th–40th Battalions, Royal Fusiliers) enlisted for service under Allenby in Palestine in its conquest from the Turks; of *Fosh* and the Night Squads, and of the *Palmach* (*Plugot Machaz* — Striking Companies), the offensive organisation formed by *Haganah* during World War II and tolerated by the British while Palestine lay under threat of capture by Rommel. But the truth is that militarily none amounted to very much: the Mule Corps and the Jewish Legion were products of 'political' Zionism's effort to win the Balfour declaration; *Fosh* and the *Palmach* were products of the need experienced by any static militia (in this case *Haganah*), to have available mobile reinforcements against local emergencies (the Active Service Units of the Ulster Volunteers of 1914 might seem a parallel). Jewish Palestine was, in 1945, a virtually unarmed, soldierless and militarily quite inexperienced community, materially and morally unequipped to fight for statehood. The return of those who had fought under British colours in World War II, either as individuals or as members of the Jewish Brigade which Britain had reluctantly and tardily raised from the *yishuv* for service in Italy, brought home some 30,000 trained men. But the future State lacked the arms to equip them, and *Haganah* the experience to form them into a national army. Two years later, at the end of the guerrilla war against the British, *Haganah* disposed of only 13,000 small arms, while its organisation was still based on the home guards of the settlements.

The 'phoney war' of November, 1947 to May, 1948 was both the making and the salvation of *Haganah/Zahal*, since the British army's disengagement allowed the Jews freedom to train, arm and fight a 'Battle of the Roads' to maintain communication between their settlements, while its presence protected them from attack by the armies of the neighbouring Arab States. In February, 1948 *Haganah* proclaimed general mobilisation and by May could show on paper nine organised 'brigades', each 2000–4000 strong, reasonably mobile and named after the areas of settlement from which they operated. Six belonged to *Hish* (*Hel Sadeh* — 'Field Corps'), the regular element of *Haganah*, and three to the *Palmach*, still a semi-autonomous *corps d'élite* dominated by the left-wing *kibbutzim* of the United group. The *Hish* brigades were: Golani (southern Galilee), Carmeli (Haifa), Alexandroni (Hadera), Kiryati (Tel Aviv), Givati (Tel Aviv) and Etzioni (Jerusalem). Those of *Palmach* were Yiftah (northern Galilee), Harel (Ramla) and Hanegev (the Negev).

Etzioni, attacked by the full weight of the Kingdom of Transjordan's Arab Legion, was overwhelmed in the first few days of the open war which broke out on, or slightly before, May 15th. The others were able to hold their own and to begin to implement the strategy which the *Haganah* had laid down in April — to secure the borders allotted by the United Nations to the Jewish State 'and those of the blocs of Jewish settlements and such Jewish population as were outside those borders'. The assault on the borders was mounted in the north by the armies of Syria, the Lebanon and Iraq, assisted by a Palestinian Arab Liberation Army; in the south by that of Egypt; as well as in the east by the Arab Legion. But despite their strength, it was only on the east front with the Arab Legion, best-trained of the regular Arab armies and operating in a solidly Arab area, that the Jewish line was broken. The first of a series of truces, negotiated by the United Nations, brought the Jews a breathing space in June, by which they profited better than their enemies to import arms and raise men, and subsequent truces helped them consistently to improve their position. By the beginning of 1949, they had succeeded (though at the cost of 6000 dead, a grievous loss to a population of 650,000) in securing, and in many places improving on, the territorial allotment proposed by the United Nations; and they had broken the neighbouring Arab States' will to continue the fight. Armistices were signed with all of them between February and July, by which Israel's military victory — though neither her sovereignty nor her right to her conquests — was conceded by her enemies.

The War of Independence had done more than preserve the infant State. It had also transformed the disparate elements of its proto-army into a unified force capable of guaranteeing its future. These elements represented a variety of party affiliations, historical traditions and cultural elements in the life of the *yishuv*, e.g. *Haganah* (the populist Labour-Zionism of *Mapai*, the majority Socialist party), the *Palmach* (the more elitist and Soviet-inclined socialism of the minority *Mapam* party) and the United Kibbutz movement (I.Z.L. — the ruthless nationalism of 'revisionist' Zionism). But the pressure of war itself did not prove sufficient to reconcile their conflicting outlooks. It took the determination of the Prime Minister and Minister of Defence, Ben Gurion, to do so. At the outset of the war he had authorised the use of force to end I.Z.L.'s efforts to secure its own supply of arms, and had then broken up its independent formations. In addition, towards the end

World Armies

he had even insisted on the dissolution of the separate command structure of the *Palmach*, though that force had proved the most efficient in *Zahal* and had won almost single-handed Israel's greatest victory, the conquest of the Negev from Egypt. He rightly took the view, however, that Israel could afford only one army and one military tradition, and that both must be 'above party'.

During his long post-war Premiership, with which he combined the Ministry of Defence, he administered a policy of appointments and promotions within the army designed to institutionalise the 'one army' idea (literally one army, for he kept the air and sea elements subordinate to the single General Staff). *Haganah* and the Jewish Brigade officers were preferred for command, I.Z.L. was frozen out altogether and *Palmach* veterans were initially restricted to non-operational posts, unless, like the rising star, Moshe Dayan, they belonged to his own *Mapai* party. Yet he was sensitive enough to the *Palmach*'s achievements to respect the tradition for which it particularly stood, that of the pioneering youth movement. While denying that the *Palmach* had a monopoly of it, and successfully seeking to imbue *Zahal*'s system of training with its spirit, in 1951 he authorised the formation of a special 'Fighting Pioneer Youth' Corps (*Nahal*) which was, in effect, a recreation of the *Palmach*, which had always combined military service with kibbutz work, under State auspices. A pioneer himself of the second *aliyah*, the creation was in any case a work of the heart.

The first serious test of the unified *Zahal* came in 1956 when, in concert with British and French forces, it was launched in an offensive against the Egyptian garrison of Sinai. Its Chief of Staff, Dayan, had been dissatisfied with its performance in border defence in the early 1950s, and had done much to improve its training, junior leadership and command. Peres, Director-General of the Ministry of Defence, had added to its inventory of weapons, which now included modern tanks and aircraft, and fresh waves of immigration had increased its numbers, so that it could field nine full-strength brigades in Sinai alone. But it remained an army chiefly of mobilised reserves. The pace and completeness of its victory, therefore, created a world-wide sensation, not diminished by its surrender, at Great Power insistence, of its conquests in Sinai, and the Israeli system, in which office-workers became infantrymen overnight and privates addressed generals by their first names, was held up as a model to older, more militarily and socially conventional armies. Those of other recently established States, in Africa and south-east Asia, seeing in *Zahal* a source of expertise hitherto thought available only from their former colonial overlords, competed to invite Israeli training teams to share their secrets of success with them. Some cautious military commentators pointed out that the Israelis had in Sinai outnumbered the Egyptians, who had also been under threat of attack by the French and British in their rear, but were generally ignored.

That it was right to ignore them was generally conceded in the aftermath of *Zahal*'s next war in 1967, when it defeated single-handed and in the same tempo the armies of all its neighbours (except Lebanon, which stood aside from the conflict). At the end of the Six-Day War (June 6th–11th) *Zahal* was proclaimed, almost as loudly by hard-headed experts as by exultant Zionists, the most perfect fighting instrument, size for size, in the world, and the superior of many larger. Indeed, its achievement is destined to stand, whatever the future brings, as one of the most remarkable of any army in the history of war. Even given that it hinged upon the success of a pre-emptive aerial attack on the bases of the Egyptian, Syrian and Jordanian air forces, which left their ground forces to do battle naked in some of the most open terrain in the world, the speed with which the Israeli armoured columns broke through fixed defences of great strength and depth and the impetus they developed in exploiting these breakthroughs spoke of military skills of the very highest order. The victory could not, moreover, be ascribed to superiority in arms, for the Arab armies deployed Soviet equipment as modern as that supplied by Western States to Israel; nor could it be ascribed to a ruthless disregard for casualties, for Israel suffered only 600 dead, a tenth of the loss of the War of Independence from a population which had grown to nearly 3,000,000.

Yet a price was to be paid for the war, if not immediately. It had to be paid in a greatly increased military budget (26% of GNP, or \$483 per capita in 1970, the highest in the world), in a lengthened term of military service (36 months for the conscripts), in an extension of the reserve duty (from one to two or even three months per year), and, after the euphoria of victory had passed, in the anxieties of a constantly sharpened vigilance. For the defeats of 1967 had inflicted a humiliation on Israel's Arab neighbours which succeeded, as the sense of grievance it replaced had not, in generating among them a relentless desire for revenge and an urge to find the opportunity to inflict it. The opportunity, as the Israeli generals came to recognise, lay in their greatly extended lines of communication. Valuable though the possession of Sinai (the principal prize of 1967) was in deepening Israel's defensive cordon, it necessarily put some of the best of the army's standing brigades 150 miles beyond the political frontier and consigned them, as the defence of a water obstacle like the Suez Canal must, to a purely static role. This new development, for all the apparent security it brought, greatly complicated Israeli strategy, which had hitherto always been based on the manipulation to her advantage of short 'interior lines', which made possible, among other things, the delaying of general mobilisation until the reality of a threat had been firmly identified, and allowed a deployment of force in the wrong direction to be rectified in short order.

Egypt's waging of what Israelis came to call the War of Attrition (1969–71) on the Suez Canal — a prolonged artillery duel — postponed perception of the changed situation, since it kept the Israelis at a high state of readiness, and at a time when the Egyptians had not recovered sufficiently from the defeat of 1967 to undertake a canal crossing. The negotiated lull which followed, however, brought Israel face to face with her new uncertainties. Her excellent intelligence services issued warnings to the government that it had detected signs of an impending attack in January, May and September, 1973, and on the second of these occasions partial mobilisation was ordered. Public criticism of what was reckoned an unnecessary expense deterred the government from issuing similar orders on the third occasion, and then again in October. Thus it was not until after the Egyptians and Syrians had begun their combined offensive on October 6th, the Day of Atonement (*Yom*

Kippur), that the reserve brigades were called to their concentration centres and that those destined for the defence of Sinai began the long desert transit westwards. The outcome of the subsequent operations, tactically as brilliant and daring as anything *Zahal* had achieved, are described under Role, Commitment, Deployment and Recent Operations.

The political and military implications of the 1973 war, and of their meaning for *Zahal*, are discussed under Current Developments. But it may well be that 1973 marked a turning point in the development of Israel's army and of its relationship with the people and the State. Hitherto it had remained faithful with remarkable consistency to its animating spirit, which was very much that of the third *aliyah*, a spirit of youth, egalitarianism and buoyant optimism, which it in its turn derived from the ethos of the *Wandervogel* and other central European youth movements of pre-World War I Europe. Indeed, in a sense, *Zahal* was the greatest of Israel's youth movements, which, while the State matured into caution and the population grew urban and bourgeois, miraculously preserved the enthusiasm of the founding pioneers. It was that youthful enthusiasm which invested Israel's campaigns with their jamboree character, and their success which allowed Israelis to believe that enthusiasm, in war as well as in peace, overrode calculation as a means towards the object of one's desire. Israel faces in the future, however, choices to which the simplicities of the pioneers do not offer answers, and it is inevitable that *Zahal* will be changed by the choices that are made. It may return to the cautious, defensive spirit of the inter-war *Haganah*, dominated as it was by the moderate socialism of the second *aliyah*. Or it may turn towards the single-minded nationalism of the revisionists and the I.Z.L., whose influence has been so firmly extirpated from its leadership. But in any case, Israel has now been brought to recognise that war is too serious to be left to boy generals.

STRENGTH AND BUDGET

Population: 3,730,000 (excluding the occupied territories)

Army: 18,000 regulars; 120,000 conscripts (including women); 237,000 reservists

Air force: 19,000 regulars; 2000 conscripts; 4000 reservists; 546 combat aircraft

Navy: 4000 regulars; 1000 conscripts; 2000 reservists; three submarines; 70 small warships; 300 naval commandos

GNP (1977): \$14,200,000,000

Defence expenditure (1978-9): \$3,310,000,000

Israel has spent an unusually high proportion of government expenditure and of GNP on defence from the earliest days of the State. In the 1950s the proportion of GNP spent varied between 6% and 8%, while expenditure rose from \$87,000,000 in 1950 to \$209,000,000 in 1960. From the mid-1960s the proportion of GNP spent on defence rose into double figures (1966, 12.4%) and in 1971 reached 26% (\$1,600,000,000). The latter figure was inflated by arms purchases from America costing \$800,000,000 but public resistance to the level of taxation it entailed reduced expenditure in 1973 to 20% of GNP (32% of government expenditure). More recent details are not available, since the defence budget is a State secret. It is not debated on the floor of the *Knesset* (parliament), and the opposition parties are not officially informed of its provisions.

Israel has received a considerable amount of foreign aid towards defence purchases, either as a remittance of the cost (by West Germany in the 1960s), or as grants or low-cost loans (by America since 1967). In general, however, Israel has paid for what it has bought abroad, financing the transactions chiefly from the contributions of the international United Jewish Appeal which, with American governmental grants, has brought in \$600,000,000 annually since the Six-Day War of 1967.

COMMAND AND CONSTITUTIONAL STATUS

Command

The three elements of command in *Zahal* are the Minister of Defence, the Chief of Staff and the Director-General of the Ministry*. Because, however, the Ministry was created only after *Zahal* had fought and won a crucial war, it is a relatively weak institution *vis-à-vis* the Staff (which, like it, is also tri-service in its purview). Its most important functions seem to be in the financing and direction of the State-controlled defence industries. Such other duties as it carries out are those which the Staff have wished upon it.

The Staff has a dual organisation: operational and administrative. Administratively, the Chief of Staff controls, through one of the four appropriate branches [General Staff (i.e. Operations, or in its Hebrew acronym *Agam*), Manpower (*Akka*), Quartermaster (*Aga*) and Intelligence (*Amman*)], the Inspectorates of the various arms of service (see Organisation) and the various routine functions of recruiting, training and administration; administratively the air force and navy are also responsible to him but, because they are small in size and largely regular in composition, they in practice administer themselves. Operationally, the Chief of Staff works through a parallel chain of command to the three areas (Northern, Central and Southern), which in turn command divisions (*Ugdah*) and brigades, as well as to the air force and navy. In peacetime the Area Commands oversee all units stationed within their territory and the local defence units (*Haganah Merhaviv*) of older reservists; in war, the Area Commands become operational headquarters. Because Southern Area faces

* In Hebrew *Misrad Habitachon*, literally the Minister of Security.

World Armies

the strongest foreign army (the Egyptian) and has the largest number of troops permanently at its disposal (including the 'school' units of the Armour Command located at Beersheba), its commander holds the rank of *Aluf* (see Rank, Dress and Distinctions), the other Area Commanders that of *Tai Aluf*.

Constitutional Status

The Israel Defence Forces (*Zahal*) were constituted by Order No. 4 of the State of Israel of May 26th, 1948, which had four clauses. The first gave *Zahal* its name, the second laid down the procedure for general mobilisation*, the fourth forbade the maintenance of any other armed force on the territory of the State, and the third defined the form of the oath of loyalty to be sworn by each recruit: 'I swear and undertake' (those with religious objections to taking oaths may affirm), 'on my word of honour, to remain faithful to the State of Israel, to its laws and its legally constituted authorities, to accept without reservation the discipline of the Israel Defence Forces, to obey all orders and instructions given by its authorised commanders, and to dedicate all my strength and even to sacrifice my life in the defence of the homeland and the freedom of Israel'.

The order did not, however, name a commander-in-chief, and the President of the State has never, as might have been expected, acceded to that role. Instead, the cabinet is invested with ultimate command authority on a collective basis, rather as is the Federal Council in Switzerland. In practice — though it may and does form *ad hoc* defence committees from its own members — it delegates its power to the Minister of Defence, 'who serves as the army's sole political master' and is responsible to the cabinet and the *Knesset* (parliament) for all military matters. Parliamentary supervision, however, is weak, for though the *Knesset* maintains a standing committee on foreign policy and security, on which all parties are proportionally represented, its powers are limited to enquiry and report.

The meagre constitutional provisions for command of the armed forces might suggest that it is a matter of secondary importance in Israeli politics. The contrary is of course the case. For the greater part of the State's existence, the Prime Minister has combined the Ministry of Defence with his own office (1948–54 and 1955–63, David Ben Gurion, and 1963–7, Levi Eshkol). When he has not done so, the post has either been held by a politician of the first rank (e.g. Moshe Dayan, 1967–74) or else become a focus for fierce political conflict, as happened during Lavon's tenure in the short interruption of Ben Gurion's protracted Premiership from 1954–5. His attempts to extend the power of the Minister into technical military matters engaged the active hostility of the then Chief of Staff, Moshe Dayan, who held the view, which was also Ben Gurion's, that the Minister's role (though an extremely powerful one, for it included the right to proclaim mobilisation without prior reference even to the cabinet) was restricted, as far as it touched *Zahal*, to organisational questions and did not include operational matters. Lavon attempted to mobilise Labour Party (*Mapai*) and trade union (*Histadrut*) support for his line by proposing the creation of a national security council, which would have reduced the powers of Premier, Minister of Defence and Chief of Staff alike. But, despite the intrusion of *Mapai* and *Histadrut* into almost all public and private affairs in the country, they declined the chance to move into the executive control of defence, an act of self-denial which brought about Lavon's resignation.

A leading analyst of Israeli civil-military relations explains the self-denial thus: 'Such a body would have become political, and the traditional political party system established in *Histadrut*, in the *kibbutzim*, in *Mapai*, in the Cabinet and in all of Israel's political and economic structures, would have turned *Zahal* back to the pre-independence era, when military structures were instruments for political influence. Under that system, chief of staff would not be selected by merit but on a political basis . . . This situation, duplicated on the lower levels of the army, would have dissolved the great achievements of *Zahal*'s unification, professionalisation and depoliticisation'†. But there was another even more important reason why the parties should agree that *Zahal* be kept insulated from that bane of Israeli politics, coalition bargaining. This was that committees breed indecision, while Israel's narrow depth of territory and dependence on reserve mobilisation make rapid decision essential to her survival. A coalition-based national security council, had it secured the right to interfere in the decision for mobilisation, might have debated Israel into defeat. Joffre had warned the French Supreme War Council on August 1st, 1914 that by every 24 hours it delayed proclaiming general mobilisation, it surrendered 10 km depth of the national territory, and the same principle, though to an even more urgent timetable, applied in Israel.

Until, 1973, Israel made provision against 'defeat through debate' by accepting the necessity for a direct, unsupervised relationship between the Minister of Defence and the Chief of Staff; it bore comparison with the right of personal access (*Immediatvortrag*) to the ruler won by the Chief of the Great General Staff in nineteenth-century Germany, which was justified by similar anxieties about the security of the frontiers. As a result of the report of Chief Justice Agranat's committee of enquiry into the circumstances of the outbreak of the *Yom Kippur* War of October, 1973 submitted to the cabinet on January 30th, 1975, it was decided, however, to set up just such a ministerial committee for defence as Lavon had wanted and failed to get 20 years before. It is to be composed of 10 members: the Prime Minister, the Ministers of Foreign Affairs, Defence and Justice, and one representative of each of the parties in the Labour coalition. It is to receive intelligence, to have control over the size, deployment, preparedness and equipment of the armed forces, and to have authority to decide

* This Clause of the Order was amplified by the Defence Service Act of September 8th, 1949, which laid down the terms of recruitment and service.

† Perlmutter, A., *Military and Politics in Israel*, 91.

on the conduct of military operations within the framework of government policy. Its proceedings will be secret but other Cabinet members will have the right to read its papers and to appeal against its decisions to the full Cabinet, though not to delay implementation of its decisions.

There is no means of judging whether the new system will be more or less likely to avert the danger of a surprise attack. As with so much else in Israeli politics, the innovation is explained best perhaps in terms of personalities. The blame for the *Yom Kippur War* was believed to attach to the Defence Minister, Dayan, and to his tendency to trespass on the operational prerogatives of the Chief of Staff — exactly what he had objected to, when he himself was Chief of Staff, in Lavon's handling of the office. Because, however, the constitution does not define the Minister's responsibilities, he could not be blamed for delaying mobilisation nor for the army's subsequent bald-headed counter-offensive. But his responsibilities could be vested in a committee composed of his critics, if only until public opinion would allow a reversion to the former system — perhaps the original system by which the Premier combined his office with that of the Minister of Defence. It may be thought significant that the Prime Minister involved was one of Israel's foremost ex-soldiers, the Chief of Staff of the 1967 war, and that he took as his personal military adviser General Arik Sharon, the hero of the 1973 canal crossing.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

'The primary function of *Zahal*', wrote Ben Gurion, the guiding spirit of its early days, in 1949, 'has been to safeguard the State. However, that is not its sole function. The army must also serve as an *educational and pioneering centre* for Israeli youth — for both those born here and newcomers. It is the duty of the army to educate a pioneer generation, healthy in body and spirit, courageous and loyal, which will unite the broken tribes and diasporas to prepare itself to fulfil the historical tasks of the State of Israel through self-realisation.' These words were no doubt partly a sop to the *Palmach* pioneer-soldiers and their supporters in the aftermath of its dissolution, and a palliative to the fears of the idealistic left that the creation of a standing army would irreversibly militarise the Israeli nation. The army, however, has, as he promised, acted throughout its existence as an important medium of education both in citizenship and in civilian skills, not the least useful of which in Israel is a knowledge of Hebrew. Yet necessarily its main service to a State born in war, thrice tested in subsequent wars and constantly harrassed across its frontiers, has been performed under arms. When Ben Gurion spoke of 'holy' or 'sacred' *Zahal*, as he was given to doing, it was its warrior, not its nation-building role, that he saluted.

Like other armed forces with a single clear-cut role — the Soviet army and the United States Marine Corps are examples — the Israeli army has developed a very strong operational doctrine with which to carry it out: that of the unrelenting offensive, led from the front. The roots of the doctrine are manifold; it undoubtedly owes a great deal to classical Prussian military theory, which made its way into Israeli thinking both through Marxism (of which Clausewitz is one of the minor deities) and through German literary culture. The example of the Germans themselves, and of their principal desert soldier, Rommel, is probably another, though unacknowledged, source; Manstein, the protagonist of 'fluid' operations, and Guderian, the exponent of 'forward control', would certainly have applauded Israel's style of making war. A teacher whom the army does acknowledge is Sir Basil Liddell Hart, whose ideas on the 'Indirect Approach' were also digested by those same Germans before World War II, while the British approach to officer training, which lays such high emphasis on example and self-sacrifice, is detectable also in Israeli leadership doctrine, where it was deliberately implanted by Wingate. But the most potent influence of all has undoubtedly been experience itself. Their weakness enforced a policy of boldness upon the Israelis from the outset, results justified it in the War of Independence, and the campaigns of 1956 and 1967 gave it the force of principle. Arguments about how best the offensive should be applied have always flourished within the army, notably between the paratroopers, who favour fluidity and rapid changes of plan to profit from enemy mistakes, and the Armour Corps, which believes in the power of mechanical *blitzkrieg*, but, until the *Yom Kippur War*, the correctness of the offensive, or counter-offensive, had itself not been questioned. Since the reverses of the *Yom Kippur War*, however, the doctrine has undergone re-examination, not least because it depended, as did German *blitzkrieg* theory, upon an assumption of psychological — all too easily transmuted into a moral — superiority over the enemy. Israel's inability to keep her army mobilised for more than a few weeks without provoking the economic collapse of the nation will compel her, in any future war, to seek a quick result, probably by offensive means. But the army now accepts that it cannot count on destroying Arab morale as it did in the past. What has been called by its critics the 'collapse theory' is now rejected.

Commitment

Israel, though a member of the United Nations, belongs to no alliance. Its existence is, however, implicitly guaranteed by the United States. The State has established military relationships with a number* of developing countries, e.g. Singapore, Burma, Uganda, Ethiopia and Ghana, through the work of *Zahal* training missions invited by their governments, chiefly between 1956 and 1970. Since the mobilisation of anti-Zionist feeling by the Arab governments in the Third World, most of these connections have lapsed.

* Stated by Simon Peres to be 65.

World Armies

Deployment

Identification of Israeli formations is made deliberately difficult by the General Staff's refusal to reveal by what names or numbers they are known. In campaign accounts, brigades are referred to by letters or by their commander's forenames, but different authors are apparently issued by the General Staff with different lists of letters, e.g. A, M, X and Y brigades appear simultaneously on separate fronts in various histories of the 1967 war. There is also little indication allowed of which brigades belong to the standing army and which to the reserves. Some exceptions are that the 1st (Golani) Brigade is known to be the training brigade of the conscript infantry, the 7th the 'School' Brigade of the Armour Corps, based at Beersheba, and the Jerusalem or Etzioni Brigade a multi-battalion reserve formation assigned to static duty around Jerusalem. The survival of these War of Independence titles and numbers suggests that the others are still kept in use and, as the pattern (if not the density) of Jewish settlement has not greatly changed over 25 years, that the present reserve formations may still come from the same areas and bear the same numbers. But that does not help to locate or identify the brigades of the standing army, of which it is generally agreed that there are eleven kept at full strength and six kept somewhere between full and half strength. At least two can be placed with confidence on the Syrian border, three in the Negev and one south-east of the Gaza Strip. The location of the others is unclear but, with Jordan militarily quiescent, the majority are probably with Northern or Southern, rather than Central, Command.

Recent Operations

Israel fought the fourth of her major wars between October 6th and 23rd, 1973, against Syria and Egypt, whose forces were joined by token contingents from Saudi Arabia, Kuwait, Algeria and Morocco, and by more sizeable elements of the Jordanian and Iraqi services. The war began in the north with a large-scale Syrian armoured offensive against the Israeli positions on the Golan Heights and Mount Hermon; and in Sinai by an Egyptian amphibious assault, in the strength of several divisions, on the Bar-Lev Line, constructed by the Israelis in 1968–9 to defend the captured east bank. The time chosen was the early afternoon of the Jewish Day of Atonement (*Yom Kippur*), the holiest festival of the religious year, which most Jews spend between home and synagogue; many conscripts are given leave for it.

There had been some indication that the attack was impending but, because a partial mobilisation on similar evidence in May had proved unnecessary and provoked criticism of the expense entailed, the Defence Minister, Moshe Dayan, and later the Cabinet, only decided on October 5th to put the standing forces at advanced readiness. It was not until 7 a.m. on the morning of the attack itself that the evidence was judged — chiefly at the urging of the Chief of Staff, David Elazar — to justify a full call-out. This was arranged by the 'cellular' method: the transmission of a codeword to a select number, each of whom passed it in to 10 neighbours, and so on. Because units are formed on a neighbourhood basis in Israel, the cellular call-out achieves their mobilisation very quickly.

Not quickly enough on this occasion, however, to allow *Zahal* to oppose force with equal force on either front. In the north, the Israelis had permanently deployed two armoured brigades, including the 7th, the 'School' Brigade of the Armour Corps, both behind a deep anti-tank ditch which was backed by strong-points in 14 *telal*, the distinctive small volcanic hills of the area. Against these, the Syrians launched in the first wave three mechanised divisions, the 5th, 7th and 9th, with 600 tanks and 1400 other armoured vehicles; their task was to clear a way for the armoured reserve, 1st and 3rd Armoured Divisions and two independent armoured brigades, fielding another 1000 tanks. Such superiority would not have threatened the Israeli front's integrity had their air force been able to operate, as it had done with complete freedom and great success in 1967, in the ground-attack role. However, it was not: the Syrians had installed a dense screen of Russian SA-6 missiles and ZSU-23-4 anti-aircraft guns which, at the cost of 30 aircraft on the first day, *Zahal's* pilots found they could not penetrate. Under its cover, the Syrians were able to engage the Israelis in tank-to-tank battles at odds of five to one. On the southern sector of the front, the standing brigade lost many of these battles, had its commander killed and was forced to give ground towards the Jordan, last line of defence of the Galilee plain. The 7th Brigade on the northern sector, handled by a commander who proved himself a brilliant practitioner of mobile defensive tactics, gave ground more slowly and inflicted heavy losses on the attackers, often by mounting local counter-attacks. On the extreme north, however, the Syrians seized the summit of Mount Hermon by helicopter assault.

By the evening of Sunday, October 7th, the Syrians had advanced south of the Kuneitra–Damascus road, 10 of the 17 miles which separated them from the Jordan. But they had suffered such heavy tank losses, partly because they had quit the cover of their anti-aircraft screen, that they had to spend the Monday reorganising, and renewed their attack only on Tuesday, October 9th. By then the Israelis had themselves committed their mobilised reserve brigades and, although they lost a little more ground south of Kuneitra, were able on Wednesday, October 10th, to counter-attack in force; by that evening they had returned to the 1967 ceasefire line. On October 11th they began to advance beyond it and by Saturday, October 13th had reached to within 35 km of Damascus.

The first week of fighting on the Sinai front had seen no such upturn in Israeli fortunes. There the battle had opened on October 6th, at 1405 hours, with a 53 minute bombardment of the Bar-Lev Line by 1000 Egyptian guns, followed by a crossing of 10 brigades of infantry in assault boats. The company posts of the Line, garrisoned for the most part by reservists of the Etzioni Brigade fulfilling their annual recall liability, were weakly held and all but a few at once fell. The Egyptian infantrymen then moved forward about 6 miles into the desert, north and south of the Great Bitter Lake, and

established an anti-tank guided-missile defence line. In their rear, sappers began breaching the high sand ramparts, erected by the Israelis, to allow egress for the tanks of the two follow-up armoured divisions which, that night, began to cross by bridge and ferry. Israeli aircraft which attempted to interfere ran into a missile and gun screen similar to that emplaced by the Syrians on the Golan.

Three Israeli standing armoured brigades were deployed in Sinai and the most forward, the 14th, suffered heavily in attempts to staunch the initial break-in. Gonen, the overall commander (one of the most successful brigadiers of 1967), kept his other two in their support positions until, on October 9th, sufficient of the mobilised brigades had made their way to him across Sinai (at a speed of 10 miles per hour — that of the tank transporters) to enable him to risk a counter-attack. When delivered, it proved a mistake; the 190th Brigade, unprotected by air cover, attempted an orthodox all-tank assault in close formation and was destroyed by salvos of Sagger missiles fired by the Egyptian infantrymen. Its commander was captured and later interrogated on Cairo television, a particular humiliation for *Zahal*, which in 1967 had had even fewer prisoners taken than it suffered fatal casualties. Thus deterred, the Israelis kept their gathering brigades beyond range of the Egyptian anti-tank and anti-air screens, waiting for the enemy to bring his own tanks, of which 1000 had now crossed to the east bank, forward of its protection. They did on Sunday, October 14th, and were repulsed, losing a quarter of their armour.

This success, coinciding with the relief of pressure on the Golan, and the concentration of four divisions (13 brigades) in Sinai, was taken by the Israelis as the opportunity they had awaited. The most aggressive of the divisional commanders, Arik Sharon, creator of the Israeli paratroopers, had proposed reducing the Egyptian bridgeheads by making a Canal counter-crossing into their rear and he was now given permission to take his two armoured brigades and two parachute brigades across. Choosing a point just north of the Great Bitter Lake, which divided the Egyptian bridgeheads, and a spot (at 'Chinese Farm') in the ramparts which the Israelis had built deliberately weak for that purpose, he breached a gap under cover of darkness — an element which he had taught the paratroopers to make their own — build a bridge and got onto the west bank by daylight of Tuesday, October 15th. For some time the Egyptians remained unaware of his presence, then underestimated in what strength he was across and, when eventually they concentrated force to expel him, found it insufficient. Despite heavy concentric attacks against the flanks of the corridor to Sharon's crossing-place (on the east bank), they were likewise unable to sever his communications, which the Israeli pilots also used as an air corridor through the missile screen to the west bank. With their support, Sharon drove columns southward, behind the Great Bitter Lake, to reach the southern course of the Canal proper on October 22nd and the town of Suez on October 24th. By that bold stroke, he cut clear across the rear of the Egyptian Third Corps (wrongly called Third *Army* in communiqués) which, because of the interposition of the Great Bitter Lake and the Israeli trans-Canal corridor between it and Second Corps (*Army*), found itself completely marooned, without access to supplies, in the desert on the east bank.

On the following day a ceasefire, which had been called for in the United Nations Security Council on October 22nd, came into effect on both the Suez front and on the Golan front where, on October 21st, Israeli heliborne paratroopers had recaptured the summit of Mount Hermon. The war had cost the Israelis 2412 dead and 508 missing, and left 400 prisoners in enemy hands. It had also almost exhausted *Zahal*'s stock of munitions, calculated to feed a war of 30 days, and required the import from America during the conflict of weapons and supplies, including electronic counter-measure devices hitherto disdained, costing \$2,200,000,000. It had also, despite Sharon's belated masterstroke, badly shaken the self-confidence of the Israeli people and of *Zahal*. Their Arab neighbours had displayed military skills they were not believed to possess and the frontiers of 1967 had been shown to offer less than the total security their capture had been thought to have brought. Rapid mobilisation, though it had worked as well as before, had not saved the standing brigades from grievous loss in the opening battles, and air/armour *blitzkrieg* tactics, the orthodoxy of Israeli military philosophy, had for the first time failed. The consequences of these developments, as they affected *Zahal* and its leaders, are discussed under Current Developments.

ORGANISATION

Arms of Service

The domestic organisation of *Zahal* is highly centralised. All corps, including the air force (*Hel Avir* — Air Corps) and the navy (*Hel Yam* — Sea Corps), are regarded as belonging to a single service and, although the air force and navy do in practice enjoy considerable autonomy, all are subject to the authority of a single chief of staff, besides being administered by a single defence ministry.

There are 16 corps of the ground forces: the Armour (which includes armoured infantry); Artillery; Infantry and Parachute; Engineer; Signal; Ordnance; Supply and Transport; General Services; Women's (*Chem*); Medical; Military Police; Education; the Rabbinate; the Judge Advocate's Branch; Military Intelligence; and *Nahal*. The Supply and Transport Corps and the Ordnance Corps are administered by the Quartermaster Branch; the Education, Medical, Women's and Military Police Corps, the Rabbinate and the Judge Advocate's Branch are administered by the Manpower Branch, and the others by their own chiefs, who are technically Inspectors under the Chief of Staff. There are some exceptions: the Chief of Military Intelligence is the head of a branch of the General Staff, co-equal with Manpower and

World Armies

Quartermaster, the Chief of Armour is both inspector and the head of a command, thus having autonomy approaching that of the air force and navy commanders, and *Nahal* is also a separate command. This 'Pioneer Fighting Youth', for which its Hebrew acronym stands, is of political rather than military importance. Founded in 1951, it was intended to perpetuate the *Palmach*'s tradition of combining military work with agricultural work. Members of *Nahal*, a volunteer corps, go after training to help establish *kibbutzim* in frontier areas subject to enemy attack. It numbers about 5000 and garrisons about 30 settlements.

Operational

'We have never revealed', declared General Dayan in 1967, 'and I hope we never shall, what the size and numbers of the Israel Defence Forces are'. He and his successors have been remarkably successful not only in keeping these facts secret, but also the identity, location and organisation of its units.

The principal formation since the War of Independence has been the brigade, of which there are three types: armoured, infantry and parachute. During the 1956 War, however, experiments were made with a loose divisional formation, known as the *ugdah*, which appeared again in 1967 and, by 1973, seemed to have taken on the formal structure of a Western division, with three brigades (two armoured and one of mechanised infantry). Under the influence of Generals Elazar and Tal, who each successively commanded the Armour Corps and the General Staff (Operations) Branch, these formations became exceptionally 'tank heavy', with two tank battalions in the tank brigade and one in the infantry brigade.

The army is believed to keep 11 brigades (five armoured, four infantry and two parachute) at full strength (i.e. as standing brigades), and six (one armoured, four mechanised and one parachute) at between full and half strength. Its fully mobilised strength, including lower-grade reserve brigades, is said to total 33 brigades. Careful identification of formations in the 1967 War suggests, however, that only 22 came into contact with the enemy and it does not seem that more were deployed on the battle-fronts in 1973. The difference between the identified and notionally total number — about ten — is therefore probably made up of reserve infantry brigades of low mobility.

The difference in organisation between armoured, parachute and infantry brigades is difficult to grasp. The armoured infantry belongs to the Armour Corps and, in 1967, some so-called 'armoured' brigades seem to have consisted chiefly of infantry in APCs or half-tracks. Parachute brigades may, equally, have a tank battalion attached, as may infantry brigades, the only difference between them being that the parachutists are actually parachute trained.

The Israeli brigade organisation is triangular: three combat battalions, a reconnaissance unit, an artillery battalion, signals and engineers. Battalions are also triangular, with three companies and, in the infantry, a support company. The artillery battalion has three batteries of four guns. A reasonably safe estimate of brigade organisation, therefore, is to say that armoured brigades are mainly composed of tank battalions, parachute brigades mainly of infantry battalions (probably mounted in half-tracks or APCs), and that infantry brigades, if of the standing army or first-line reserve, are mainly composed of APC battalions with a tank battalion, while if of the second-line reserve they are probably carried in requisitioned civilian transport. All units are rather small by Western standards, with as few as 35 tanks in the tank battalion. The brigade reconnaissance unit is equipped with AMX-13 tanks, armoured cars, jeep-mounted anti-tank guns or now with captured Russian light armoured vehicles.

The great variety of equipment in Israeli hands further complicates analysis of the army's organisation. The standing brigades certainly have the newest of the bespoke equipment, while the oldest of the captured equipment goes to the lower-grade reserve formations. But in 1967, several of the reserve armoured brigades were as well-equipped as the standing ones. Equipment is not mixed in the battalions. Despite their standardisation of both bespoke and captured tanks, which all now have diesel engines and a 105 mm gun, they outfit battalions with a single type. There have recently been reports of negotiations with at least one foreign country for the sale of some or all of the older captured Russian heavy armour.

Territorial Defence

The oldest classes of the reserve, those over fifty but perhaps also some men in their forties, are enrolled in the *Haganah Merhavit*, the Home Defence Groups, which defend the villages and rural settlements. Over-age town dwellers are enrolled in Civil Defence. The units of *Nahal*, though formed of young people, remain at mobilisation in their *kibbutzim*, which it is their first task to defend.

Border Police

This is a paramilitary force of about 4000 which patrols the frontiers, particularly that with Jordan. Many of the Druze conscripts are posted into it.

RECRUITMENT, TRAINING AND RESERVES

Zahal is the best-known example of a civilian militia in the world today. But exactly what sort of militia is it? In the aftermath of the War of Independence, when its leaders had to tackle the question of how best to secure their fragile State against the dangers of a new war, they examined the suitability of two military systems in particular: *Haganah's Hish*, a wholly part-time force, and the Swiss *Miliz (q.v.)*, a large reserve army fed by a small annual conscript contingent. Yadin, the first Chief of Staff, actually visited Switzerland in 1949 to study the *Miliz*; and it is maintained that *Zahal's* organisation was based more closely upon it than on any other. Whatever the original inspiration, however, the resemblance between *Zahal* and the *Miliz* is now tenuous. In Switzerland, the initial term of service is very short (118 days), the first-line (*Aufzug*) combat units come into existence only for three weeks each year, while, for several winter months when even the training units are empty, Switzerland is virtually disarmed. Moreover, the ratio of cadres and conscripts under training to reserves is very low, about 6:100. In Israel the ratio is 36:100, the length of the initial term of service is 3 years and over half the combat units are kept permanently in being. In short, though *Zahal* is undoubtedly a militia, it approximates far more closely in organisation, if not in *esprit*, to the conscript armies of late nineteenth century Europe than to the National Guard of the burger republics of northern Europe. The reason is immediately apparent: France and Germany maintained large conscript armies between 1871 to 1914 because each feared the other's capacity (a) to achieve a surprise attack across the frontier with strong standing forces and (b) to follow it by a mass offensive with rapidly mobilised reserves. It is exactly those dangers which Israel faces and which produces in the Israeli military system so many features more reminiscent of those of the Third Republic or Second Reich (in which, for example, the ratio between standing army and reserves was 27:100) than of that of neutral Switzerland.

Recruitment

Conscription is universal, under the Defence Service Law of 1949. There is no voluntary enlistment and no special entrance for future officers. All fit Israelis are inducted at the age of eighteen, men for 3 years, women for two; this produces about 17,000 recruits a year. The small Druze and Circassian communities have, since 1955, also been liable, at their leaders' request, to conscription, but Arabs, Christian and Muslim alike, are exempt (they may volunteer, but none is known to), as are full-time theological (*Yeshiva*) students and the daughters of ultra-orthodox families; the latter concession was at one time the cause of serious political bickering in the country, but only 50% of eligible women are recruited in any case, the army being able to find suitable non-combatant employment for no more. Of the eligible men, 90% are recruited, a far higher proportion than in any other conscript army, explained both by Israel's exigent manpower requirements and by the importance placed on the army's 'melting pot' role in the education and assimilation of new immigrants. Older immigrants (men up to twenty-nine, women up to twenty-four) are subject to the same rules as those aged eighteen, those older still to shorter enlistments. Conscientious objection is not recognised by the law but, under discretionary powers granted to the Minister of Defence, ethical, though not political, objection is respected and exemptees are assigned to alternative civilian duty.

Training

Soldiers

Pre-service selection is rigorous, since the army's 'high-technology' style of warfare requires large numbers of technically skilled entrants to the armoured, mechanised and artillery units. There is a particularly intensive course of selection for pilots. Selected recruits are distributed to training units, in which they serve 3 months, and then to the standing brigades and their support units. The aim is to get every able-bodied recruit into a combat formation; only the less fit and the specialist are found in support units. Suitable specialists are in short supply and the army runs a number of technical high schools, for those aged sixteen to eighteen, to provide technicians to the air force, navy, and signal, ordnance and engineer corps. It also provides in-service facilities for poorly educated recruits (usually north Africans or Yemenis) to get the elementary school certificate and it acts as a principal medium of Hebrew teaching in the immigrant community.

Officers and NCOs

After 3–5 months' service in a standing unit, suitable candidates are sent to NCO training school for 3 months. About 50% of recruits reach the rank of corporal. After further unit service, potential officers are selected from among them and are sent to the Officer Cadet School for 3 months, and then to a 3 month course at their corps school. The whole officer-producing process, from recruitment to commissioning, lasts 14–18 months (though it has tended to shorten since 1967 by an elimination of the NCO course for potential officers). At the end of conscript service, a final selection is made to choose regular officers. Because there is difficulty in finding enough suitable candidates (many of the suitable conscript officers preferring to return to civil life), the army runs a military cadet scheme, not dissimilar from the old German *Einjahrfreiwilliger* system. Boys from two of the country's foremost high schools, the Reali in Haifa and the Herzlia in Tel Aviv, spend

World Armies

their vacations at military duty and in return are granted the rank of corporal on enlistment. If commissioned, as most are, they are expected to serve an additional 2½ years beyond conscript service. Competition for the cadetships is keen, six applicants appearing for each vacancy, though the education is not free*.

There is no promotion in the reserves from conscript NCO rank (except for promotion in the field). Some reserve officers, however, choose to attend courses, in their own time and at their own expense, which allow them to be promoted up to the rank of lieutenant-colonel. Promotion for regular officers is rapid: 4 years as a subaltern, and three in succeeding ranks, is the norm. Company commanders are therefore usually about twenty-five, battalion commanders thirty, brigade commanders thirty-five to forty, the Chief of Staff forty-five. Retirement is obligatory at fifty-five but most officers go out between forty and forty-five. It is official policy to encourage among them a 'two career' attitude and the interpenetration of military and civilian life in Israel makes it easy (too easy, some critics argue) for ex-officers to move into responsible and well-paid civilian jobs. Despite the rapidity of promotion, however, it is by no means automatic. Selection is rigorous, those passed over are compulsorily retired and failure in performance freezes a man in rank.

Officer training (except for the navy and air force, which is separate from the start) begins with a platoon commander's course, based on that of the *Palmach* and inculcating its spirit of 'follow me' (the motto of the Israeli officer corps and, in theory, the only order an officer may give under enemy fire). Thereafter training takes place within the officer's own corps, with which he remains throughout his service (there are very strong corps rivalries in *Zahal*, particularly between armour and paratroops), though as much through rapid job-rotation as formal instruction. The army does hold, however, both a company commander's course (also open to reserve officers) and a staff course (a requirement for promotion to colonel rank) (*Poum — Pikud u Mate*, meaning Command and Staff), though there is no military academy or staff college as such. The army prefers to sharpen its officers' intellects by sending them on paid leave to civilian universities (25% have university degrees which facilitate the transition to a civilian career) or to widen them by a posting to foreign staff colleges. Most senior officers have followed both courses.

About a quarter also, though not necessarily the same quarter, are *kibbutzniks* or *Moshavniks*, though those groups form only about 8% of the Israeli population. This relationship between the communal settlements (in which the spirit of the State of Israel was born and nurtured) and the officer corps is well-known, and may be explained in a number of ways: firstly by the domination of all *élite* activity in Israel by *kibbutzniks*, secondly by the ethos of civic devotion and self-sacrifice inculcated in the *kibbutzim* (which have been accused of playing the same role in Israeli society as the public schools in British), and thirdly by the opportunity for advancement the army's promotion policy offered to young men whose ageing fathers virtually monopolised all the civilian posts of power and influence in the country. The first significant reduction of the abnormally high age of politicians in Israel has recently been brought about by the appearance in government of some of the country's abnormally young ex-generals.

Even if not *kibbutzniks*, most officers are *sabras* (native-born). Most conscripts, on the other hand, are immigrants, either Orientals or Slavs, this reflecting the low *sabra* birth rate and the continuingly high rate of immigration. Yet this 'ethnic' division does not (yet) seem to be a cause of resentment in the country. Even though the restricted career opportunities open to immigrants and the children of Orientals is threatening to become a cause of serious social and political tension in the country, *Zahal* is generally absolved of charges of discrimination and admired as the nation's one genuinely open institution.

Youth

All Jewish high-school youths must belong to *Gadna*, a paramilitary youth organisation administered by the Ministries of Defence and Education. Conscious of the genuine dangers in, and the damaging connotations attaching to, the State's sponsorship of such a movement, the government has charged it with a dual role: that of making the country's young 'defence minded', but of discouraging 'militarism' by turning their energies into social, agricultural and athletic activities. *Gadna*, however, is organised into battalions and provides courses in aviation, seamanship, signals and marksmanship 'for those interested'. A special branch of the General Staff exists to supervise it.

Reserves

The great majority of Israeli servicemen are reservists. Like the Swiss, they are encouraged to think of themselves as being on leave from their units, which are localised and can be activated in as little as 12 hours. There are two methods of recall: by proclamation, which brings out the whole army, or by the transmission of coded call-signs by radio, telephone, or word of mouth, which allows the mobilisation of selected units only. Reservists are divided into first and second line, the division apparently falling at the age of thirty-nine. Men remain on the reserve until fifty-four, childless women to thirty-eight. The oldest reservists are assigned to the local defence groups of the static *Haganah Merhavit* or to Civil Defence, but the younger take to the field with the reserve brigades. Exactly which age-groups are assigned to fighting units of the mobile army and which to its services has varied with the strategic situation, and is kept a secret. Again, the parallel may be drawn with the secrecy surrounding reserve policy in France and Germany before 1914.

* It may be significant that these are the two oldest and most distinguished high schools in Israel. In 1914 the entire graduating class of the Herzlia was commissioned as officers into the Turkish army.

Reservists are also subject to annual training (the *milvim*), for a minimum of 1 day each month; those aged up to thirty-nine (childless women to thirty-four) must serve 31 days and officers and NCOs a further seven. Between 1967 and 1973 the annual liability rose to sixty or even more days a year, and many reserve units were deployed *en bloc* in the Bar-Lev Line for weeks at a time.

EQUIPMENT AND ARMS INDUSTRY

By the October War (of 1973) Israel was producing a wider range of artillery and infantry weapons, missiles and electronic equipment, aircraft, and battle tank and gun conversions, than any country in the world except Sweden and the Great Powers. The complex of Israeli research establishments and defence industries was engaged in a broad front effort that covered the full spectrum from nuclear physics to mechanical engineering. This achievement was the fruit of a decision, taken in 1967 and prompted on the one hand by Russian generosity with arms supplies to the defeated Arabs, on the other by the fear that America might not always be counted upon to deal likewise with Israel, that the country should, as far as possible, become self-sufficient in military equipment. The means to implement the decision lay to hand in the already existing State-owned defence industries, largely created by Simon Peres (in 1975 Minister of Defence) during his time as Director-General of the Ministry of Defence, 1959–65. The largest are Israel Aircraft Industries (I.A.I.), Tadiran (Israel Electronic Industries) and Ta'as (Israel Military Industries), which originated as the clandestine weapon-procurement branch of *Haganah*. A major collaborator in their work is the army's own Ordnance Corps which now has great experience in the re-arming and re-engineering of foreign military equipment, particularly tanks, both bespoke and captured.

Seen in perspective, the decision to aim for self-sufficiency was a logical extension of a trend in Israeli armament policy present at the founding of *Zahal*, and even before. Its first heavy weapon, the Davidka mortar, had had to be locally produced during the mandate in secret workshops, while so miscellaneous was such equipment as it was able to buy overseas during the War of Independence that its conversion to common standards was an urgent necessity requiring considerable industrial improvisation. From the early 1950s the State was able to buy new (instead of second-hand) equipment from abroad, the deals being financed out of its own booming exports, from the capital contributions of foreign Jews and from the West German government's reparations. It had, however, to buy when and where it could. Jet aircraft came from France and Britain, tanks from Britain and West Germany and, from the mid-1960s, armoured vehicles and aircraft from the United States. Moreover, these supplies were subject to interruption for diplomatic reasons at any time, were rationed by Great Power agreements to restrict levels of armaments in the area (notably the Tripartite Declaration by America, Britain and France of 1950) and continued to yield a very miscellaneous inventory of equipment, which the windfalls of victory in 1956 and 1967, welcome though they were, even further diversified.

Zahal's unwilling experimentation with this wide variety of equipment prompted it towards a companion decision to that for self-sufficiency: concentration on a strictly limited range of weapons. By 1967 the High Command had the clearest picture possible of the sort of weapons the wars it had to fight required, and specified that effort should not be wasted in producing a 'balanced' inventory. In aircraft, it decided to settle for an 'all-fighter' force, bought abroad but extensively modified, either by the manufacturer or in Israel, to perform interceptor and strike roles; in armour, to outfit the standing brigades with big-gun heavy-armour tanks (Centurions and Pattons), and to convert captured material to the same standard, but to keep older equipment (its by now antiquated Shermans) in service as long as it could safely be used by the reserve formations; in light military engineering, to produce a few types of weapon which would both satisfy its own requirements and capture export markets, a policy in which it has been successful: the Uzi sub-machine-gun and the Israeli–Finnish Tampella mortar are sold widely abroad, thus offsetting a little of its enormous arms bill.

The Israelis' armaments policy bears comparison with that of Switzerland, except that they are now moving to achieve self-sufficiency in types of equipment which neither Switzerland nor any other industrial country of their size attempts to manufacture. They have produced their own Mach 2 jet fighter (the Kfir) and a main battle tank, and certainly have in production an air-to-air missile (the Shafrir), a surface-to-surface missile (the Ze'ev (Wolf)), the Gabriel anti-shiping missile and the Reshef class of long-endurance missile boat. They are also widely believed to possess a nuclear weapon, or at least its disassembled parts, and a short-range (300 mile) ballistic missile, the Jericho, in which it might be fired.

Arms and Equipment

Rifle: 7.62mm FN (Belgium; Israeli manufacture) and G3 (Spanish CETMA; West German manufacture)

Sub-machine-gun: 9mm Uzi (Israeli design and manufacture)

Machine-gun: 7.62mm Browning (Belgium; Israeli manufacture)

Mortar: 81 mm, 120mm (light), 120mm (heavy) and 160 self-propelled (about 900 in service)

Anti-armour weapons: Cobra missile (West Germany), SS-10 (France), SS-11 (France), LAW missile (USA), TOW missile (USA), Sagger missile (USSR); 106mm recoilless rifle (USA; equips part of the brigade reconnaissance unit)

Anti-aircraft weapons: 20mm Vulcan/Chaparral gun (USA), 30mm Hispano–Suiza gun (Switzerland) and 40mm Bofors L-70 (Sweden/Britain) (about 900 in total in service); Redeye SA missile (USA); Hawk missile (USA; manned by the air force using 90 launchers)

World Armies

Artillery: 105 mm AMX SP howitzer (France), 155 mm M-109 SP howitzer (USA), 155 mm Soltam L-33 SP howitzer (French gun on Sherman chassis) and 155 mm M-123 howitzer (USA) (about 350 in total in service); 175 mm M-107 SP gun (USA; 60 in service); 203 mm M-109 SP howitzer (USA; about 20 in service); 122 mm M-76 gun (USSR), 122 mm M-38 gun (USSR) and 130 mm M-63 gun (USSR) (probably used in static role)

Armour: M-2 and M-3 half-track (ex-American, re-built); M-113 APC (USA); BTR 40, 50, 60 and 152 (USSR) and BRDM (USSR) (about 3300 in total in service); AML-60 armoured car (France); Staghound armoured car (ex-American); PT-76 reconnaissance tank (USSR; 65 in service); M-50/51 Sherman (ex-American; converting to SP artillery — see Soltam above); Centurion main battle tank (Britain; 900 in service); M-48/M-60 main battle tank (USA; 850 in service); T-54/55 main battle tank (USSR; 400 in service); T-62 main battle tank (USSR; 150 in service); note that the total number of tanks is believed to be 3300

Aircraft: Phantom II F-4E fighter—ground attack (USA; 200 in service); Douglas A-4H fighter—ground attack (USA; 200 in service); Mirage III fighter—ground attack (France; 75 in service); about 100 large and small transport aircraft, and 100 large and small helicopters, are also in service, of French and American manufacture

RANK, DRESS AND DISTINCTIONS

Rank

Rav aluff†* (lieutenant-general)	Crossed sword and olive leaf
Aluff† (Major-general)	Crossed sword/two fig leaves
Tat aluff† (Brigadier)	Crossed sword/one fig leaf
Aluf mishne‡ (Colonel)	Three fig leaves
Sgan aluf (lieutenant-colonel)	Two fig leaves
Rav seren (Major)	One fig leaf
Seren (Captain)	Three bars
Segen (Lieutenant)	Two bars
Segen mishne (Second-lieutenant)	One bar
Rav samal rishon (Regimental sergeant-major)	} Cuff badge
Rav samal (Sergeant-major)	
Samal rishon (Staff-sergeant)	
Samal (Sergeant)	
Rav turai (Corporal)	
Turai rishon (Lance-corporal)	
Turai (Private)	—

Notes: * Held only by the Chief of Staff.

† Introduced after the 1967 War to clear a promotion block — formerly the rank of aluf was regarded as equivalent to brigadier.

‡ Introduced after the War of Independence.

Officers badges are worn in bronze on the shoulder, NCOs badges in cloth on the upper sleeve. Rank titles are biblical in derivation and are common to army, navy and air force.

Dress

'Anyone', said Simon Peres, ex-Director-General of the Ministry of Defence, 'can see that we are by no means the best dressed army in the world; the principal outlay goes on armaments. Officers get issued with the same clothing as the men.' He might have added that, with conscription universal and its necessity as widely accepted, *Zahal* does not have to make its uniform seductive. It is not, moreover, strictly true that career officers are clothed exactly as the men. They possess a British-style service dress in olive drab, worn with a peaked cap. Their normal wear, however, is the issue cotton: drab for everyday, camouflage pattern for combat, worn with a khaki beret (maroon for parachutists, black for armour). An American-pattern steel helmet is issued.

Distinctions

Until 1967, no awards for bravery were given, it being official policy to expect equal bravery from all. But after 1967, 51 Chief of Staff's Mentions in Despatches were published and a bravery award in three classes is now being instituted. *Zahal* has issued campaign ribbons for each of its four major wars.

CURRENT DEVELOPMENTS

The life of the Israeli State and people is so bound up with that of *Zahal* that discussion of its present condition and its future can scarcely be disentangled from theirs. Economically, the cost of *Zahal*, which exceeded in 1974 the high it attained in 1972, is forcing the Israeli government to seek massive assistance abroad and the Israeli people to accept further sacrifices in their standard of living. In November, 1974 the Israeli pound was devalued from \$0.238 to \$0.167, largely because of expenditure on foreign arms, while taxes, already the heaviest in the world, were increased and subsidies on basic products reduced (the latter despite a campaign of demand by Oriental and east European immigrants for improved welfare payments). The 1974 defence budget is believed to have totalled \$3,700,000,000, two and a half times the next largest previous appropriation, representing 38% of government expenditure and one-third of gross national product. Contributions from foreign Jews cannot meet the deficit this level of defence spending entails. It is not surprising, therefore, that Israel was reported in January, 1974 to have asked America for \$2,200,000,000 in aid, of which \$1,500,000,000 was for arms, and that Prime Minister Rabin, on his visit to Washington in September, 1974 is said to have been granted \$4,500,000,000 spread over 1975/6/7. Much of it was needed to pay for the 50 Phantom fighters, 250 M-60 tanks and several sorts of missiles President Ford was also said to have promised him.

Israel's situation has also apparently worsened since 1973 at a strategic level, through her abandonment of the Suez Canal line (agreement signed with Egypt, January 18th, 1974), and more recently, of the Sinai passes. On the other hand, these concessions have brought her into a long-desired diplomatic dialogue with Egypt, whose severance of her ties with Russia further alleviates Israel's international situation, while America's stationing of observers in Sinai, between the Egyptian and Israeli front lines, is an important compensation for the security that possession of the passes provided. Militarily, the shortcomings revealed by the *Yom Kippur* War are said to have been made good: the mobilisation system has been streamlined (a partial mobilisation against Syria went off successfully on November 13th, 1974), transport capacity expanded (probably to shorten transit time across Sinai, which so delayed reinforcement of the Suez front in October, 1973), new fortifications built, and communications and electronic counter-measures (the latter an area of dangerous weakness as early losses in the air war of 1973 demonstrated) improved. *Zahal's* commanders, after the restocking of 1973-4, believe that Israel has the means to wage a war of 1973's intensity for at least 21 days and to guarantee what have been laid down as current strategic priorities: to deny Arab armies the chance of gaining surprise, to avert the imposition of an air or sea blockade, to prevent the strategic bombing of the homeland and to achieve a quick victory if forced to fight a ground war — always given that avoidance of war, with its inevitable consequence of a renewed use by the Arabs of their oil embargo against Israel's foreign friends, now outweighs purely military considerations in the conduct of Israeli policy.

How fully *Zahal* itself has digested the changed circumstances with which the events of 1973 and their aftermath have faced Israel, is difficult to estimate. To an extent unparalleled in any other army, discussion of its strategic outlook, tactical doctrine and combat readiness turns on the personalities of its leaders. Much has been made of the displacement of 'armour' by 'parachute' generals since 1973, who are in turn seen to represent opposed philosophies of war making: the Armour Corps' rigid and bludgeoning, the parachutists' flexible and intuitive. It is true that the officers most severely censured in the Agranat report were from the Armour Corps, Elazar (the Chief of Staff) and Gonen (the Commander, until relieved, in Sinai), and likewise that Elazar's successor, Gur, and Sharon (the hero of the war), were parachutists. But Gur himself clearly displeased the Begin government by his 'hawkish' attitude to peace talks with Egypt, and was replaced in February, 1978 by General Raphael Eitan who, although a parachutist with a daredevil reputation, is on better personal terms with the political leadership. It has been announced that he is to oversee a reorganisation of *Zahal* which will give the army a separate command within the staff structure, as the navy and air force already have. It is expected that this will tend to reduce the direct involvement generals in the past have had in policy making, of which both Mr Begin and his Defence Minister, Ezer Weizman, are known to be critical.

The Israeli army's latest operation (March, 1978), to clear the south of Lebanon as far as the Litani river of Palestinian Liberation Organisation guerrillas, did not require a mobilisation of reservists. It was probably long contemplated, and contingency plans already laid. The supervision of the cease-fire line by United Nations contingents is only partial, but despite this Israeli forces were withdrawn from Lebanon by the middle of June, 1978.

JOHN KEEGAN

ITALY

HISTORY AND INTRODUCTION

Italy produced the first modern armies: the bands of highly trained, full-time and (when in employment) well-paid mercenary soldiers with which the northern cities waged war against each other in the fourteenth and fifteenth centuries. But their epoch was short-lived, for, once Italy's stronger neighbours had learnt to raise professional armies of their own, the very disunity of the City States condemned them to invasion, defeat and dependence. It also condemned Italy to centuries of division and to clientage or foreign rule — under the Austrian Hapsburgs in the north and the Spanish Bourbons in the south — which left only the Papal States in the centre and Piedmont in the far north a conditional independence. Neither, by reason of their circumstances, maintained a large army or sought a warrior reputation.

Italy approached unification and statehood in the nineteenth century, therefore, without a strong military tradition or indeed the military means to rid the peninsula of its foreign overlords. Thus when the Kingdom of Sardinia–Piedmont (ruled by the House of Savoy, which had produced in Prince Eugene one of the greatest soldiers of modern times) raised the standard of national revival (*risorgimento*) against the Hapsburgs in 1848, its tiny army, though joined by volunteers from all over northern and central Italy, was easily beaten by superior Austrian power at Custoza and Novara. It was not until Napoleon III, for reasons of his own, brought his army to Piedmont's aid in 1859 that the Hapsburgs were forced to cede a portion of their Italian possessions; and not until 1866, when the newly proclaimed Kingdom of Italy joined in Prussia's attack on Austria (though without notable success), that the Venetian provinces were incorporated. By then the Bourbon Kingdom of the Two Sicilies had also fallen to Piedmont, thanks to the inspired guerrilla generalship of Garibaldi; and within 5 years the Papal States too were to be brought within its boundaries.

By that date the Italian army had won a certain military name. Its nucleus, the *Armata Sarda*, the royal army of the House of Savoy, had played an ostentatious part in the Crimean War on the Anglo–French side; it had produced in the La Marmora brothers a trio of generals known to the European public; and in the *Bersaglieri*, the romantically beplumed Piedmontese light infantry, it possessed a force which seemed to rival the French *Zouaves* in battlefield bravura. The army remained, nonetheless, an artificial and fragile creation. Established by royal decree on May 4th, 1861 as the *Esercito Italiano*, an amalgamation of the *Armata Sarda* with the forces of Modena, Tuscany, Parma and Bourbon Naples, and with the guerrilla bands of Garibaldi, it lacked a sense of unity and *esprit de corps*. The Piedmontese and Neapolitan armies had too recently been at war with each other to work easily in harness and the officers of both looked down on the adventurers of Garibaldi's Thousand who claimed equal status with them. The army, moreover, was unpopular with many of the new Kingdom's inhabitants, both because of the innovation of conscription and for its use in suppressing disorders caused by other administrative reforms which convulsed the south throughout 1861–5; and it was viewed by the devout, particularly after the forcible occupation of Rome in 1870 and the Pope's self-exile inside the Vatican, as an instrument of blasphemy. Over three-quarters of those drafted for service in Basilicata, in the foot of Italy, in the 1860s took to the hills and even in 1910 one-fifth of southerners evaded military service.

By then, however, the army had gone some way to recommending itself to the population. In imitation of the German and French armies, it had taken to calling itself the 'School of the Nation', had indeed been called by a leading senator, Farini, in 1894, 'the only existing cement which holds the country together', and was indeed probably the only national (as opposed to provincial or municipal) institution with which a nineteenth century Italian — the citizen of a still intensely regional country — came into contact. On the other hand, it had continued to incur odium for its role as an instrument of repression, particularly during the great outburst of agrarian unrest in 1898, and it had undergone two humiliating disasters on campaign in east Africa: Dogali in 1887 and Adowa in 1896; the latter was the worst defeat suffered by European troops at the hands of Africans during the conquest of the continent, a setback which interrupted for 40 years Italy's attempt to conquer Ethiopia and a blow to national self-esteem for which the conquest of Libya from Turkey in 1911–2 only partially compensated.

In the light of these circumstances, the performance of the Italian army in World War I, which it entered on the opening of hostilities with Austria in May, 1915 with the aim of conquering the last Italian-speaking provinces of the Hapsburg empire, was remarkable. Badly equipped and supplied, fielding only 25 divisions at the outset (a figure which quickly rose to 35 and to 65 by 1917), it at once undertook an offensive against the slopes of the Julian alps above the river Isonzo, and, over the next 2 years, renewed the offensive no less than 10 times. The loss of life suffered and the conditions in which the troops were obliged to live and fight were appalling. By the autumn of 1917, nevertheless, the army was on the point of winning substantial gains from the Austrians, who accordingly sent urgently for help to the Germans. They organised a task-force of fresh, mountain-trained soldiers, skilfully selected a weak spot on the Italian front at Caporetto (Karfreit) and launched through it a brilliant alpine blitzkrieg which destroyed the Italian Second Army and forced the whole line back to the river Piave in the Lombard plain.

With French and British help the Italians, in the autumn of 1918, went over to the counter-offensive, in a battle they call Vittorio Veneto, and eventually recovered most of the ground lost the previous autumn. They were thus able at the peace to lay claim successfully to the *Italia irridenta* for which they had gone to war. But the war's sufferings — over 600,000 Italians had been killed — had not brought Italy internal peace. It had indeed brought on an open conflict between the socialists and Mussolini's new populist and nationalist party, the Fascists, which resulted in greater and greater illegality of behaviour between the two, which the sitting liberal government seemed unable to control, and culminated in Mussolini's March on Rome of October, 1922. There seems no doubt that many officers and ex-officers, whose careers had ended with the war, were in sympathy with Mussolini, but equally little doubt that the army as a whole opposed him and, with effective leadership, could and would have kept him from power. Mussolini was, however, effectively invited to usurp power by the King, to whom the army was unconditionally loyal, and it did not therefore resist his capture of the machinery of State.

It came, nonetheless, to regret it, for though his imperial policy allowed the army, in 1935–6, to avenge in Ethiopia the defeat of Adowa, he obliged it also to accept as a co-equal the socially uncouth Fascist militia; while in 1940 he committed it, unprepared and unequipped, to war at the side of Hitler against, first, the French and British, then the Greeks, then the Russians and eventually also the Americans. War with America, in which 6,000,000 Italians had made their homes, seemed to the majority of the nation almost as much a sacrilege as a folly; but the army had already suffered worse in the desert war against the British and in the campaign of Stalingrad against the Russians. It is now fashionable to decry the value of Italy's contribution to the Axis war effort; and it is true that much of the Italian army fought very badly and at times did not fight at all. On the other hand, those parts of it which had a modicum of modern equipment, fought well, while, as soon as Mussolini was overthrown and the successor regime accepted by the Allies as a co-belligerent, its remnants fought enthusiastically on the Allied side. These consisted of the *1° Raggruppamento Motorizzato*, formed in September, 1943 immediately after the armistice and attached to the United States Fifth Army, the *Corpo Italiano di Liberazione* and eventually six formations of divisional strength: *Cremona*, *Legnano*, *Friuli*, *Folgore*, *Mantova* and *Piceno* (on which the post-war army was eventually established). At the same time, the breach with Germany called into existence in northern Italy a partisan movement, which became a genuine expression of popular resistance and greatly impressed the Allied officers who were sent to advise it.

If the Italian army had fought badly in the war, it was largely because the war aroused little or no enthusiasm among Italians, who were moreover well aware that their army was unprepared for modern operations on a major scale. In coming to an assessment of the Italian army's worth, it is probably more instructive to reflect on its performance in World War I, in which its casualties were proportionately as heavy as those suffered by any other belligerent, its achievements by no means less and its one notorious failure, Caporetto, a crisis of morale scarcely different from that suffered by the French in May, 1917, by the British in March, 1918, and by the Germans at the end of the war.

There may, on the other hand, be something in the argument that the army, like so many of the other institutions of the modern Italian State, is essentially a northern creation foisted onto the centre and south by the process of political unification and never properly assimilated; it is significant that the units of high prestige, the *Bersaglieri* and *Alpini*, are northern in origin. Many Italians seem to accept this analysis. On the other hand, there is, as in France, strong left-wing hostility to the idea of reducing the army to a collection of high-prestige, all-regular units, which it is feared might be used against the left-wing parties in some future political crisis. It seems likely, therefore, that, as in France, the large conscript army will continue to exist precisely because of the doubts about its true military worth.

STRENGTH AND BUDGET

Population: 56,700,000

Army: 218,000 (163,000 conscripts); 550,000 reserves

Navy: 42,000 (including 1700 marines); 27 major warships, 47 smaller craft

Air force: 70,000; 336 combat aircraft

Paramilitary forces: 90,000 Carabinieri; 72,000 Public Security Police

GNP (1976): \$161,600,000,000

Defence expenditure (1977): \$4,640,000,000

Two factors operate to restrict the military value of the sums, relatively and absolutely large, which Italy spends on defence: the first, a constant one, is the high level of personnel and operating expenditure; the second, a more recent one, is the rate of domestic inflation, which produced rises in equipment costs between 1973 and 1974 of the order of 40%. Thus a Leopard tank, which in 1971 cost 180,000,000 lire, cost in 1975 300,000,000; over the same period, the cost of maintaining a conscript — and the Italian conscript receives nominal pay — rose from 960,000 lire to 1,600,000. The 1975 defence budget, though second only in size to the education budget, therefore yielded very little towards procurement and modernisation. Out of a budget of 2,451,000,000,000 lire, 1,433,000,000,000 was devoted to personnel costs, 46,000,000,000 to pensions, 255,000,000 to the maintenance of conscripts and 31,000,000,000 to running costs, leaving only 987,000,000,000 for procurement, research and modernisation, and this between the three services. The army needs to allocate a capital sum of

World Armies

1,800,000,000,000–2,000,000,000,000 lire to modernisation over the next 10 years, but receives at present only enough to complete its programme of modernisation in 25–30 years. And it is probable that the money should ideally be spent over a shorter period than 10 years, since large-scale re-equipment effectively ceased in the mid-1960s. As a result there are notable deficiencies in those equipment categories where technological change is rapid: anti-armour systems, air-defence systems and radio communications.

COMMAND AND CONSTITUTIONAL STATUS

The President of the Republic is titular Head of the Armed Forces, but control is exercised by the cabinet, the Defence Ministry and its administrative machine. Like most of the more important ministries, defence has a parallel council (but is appointed, not elected), which the government is bound to consult, and in this particular case it is a policy-forming, not consultative, body, the Supreme Defence Council (*Consiglio Suprema di Difesa*); its members are the President, the Prime Minister, the Foreign, Interior, Treasury, Industry and Defence Ministers and the Chief of the Defence General Staff. It must meet at least twice a year.

The Defence Ministry is a unified body, whose minister works through two distinct chains of command. One is purely administrative and runs through the Defence Secretary General (a serving officer) to five Central Offices, responsible respectively for judicial and legislative affairs, budget and finance, organisation and methods, national mobilisation, and administrative inspections. The other is military; at its top is the Defence Secretary General and the Chiefs of Staff Committee, which consists of himself and the four chiefs of staff. Through the Defence Secretary General, it controls 19 General Directorates, which chiefly oversee personnel administration, procurement and supply of equipment and building, and works. It also advises the minister on operational planning, finance and organisation. The executive counterpart of the Chiefs of Staff Committee is the Armed Forces Supreme Board (the Defence Secretary General and the chief of staff of, and two general-rank officers of, each service) which meets either jointly or separately, depending on whether the agenda concerns one or more of the services.

The Defence Secretary General is therefore the central agent of the defence machine: upwards, he is directly responsible to the minister; to him are responsible the chiefs of staff. The Army Chief of Staff heads an Army General Staff divided into four Divisions — Personnel, Intelligence, Logistics and Operations; and six Inspectorates — Infantry and Cavalry, Artillery, Engineers, Signals, NBC Defence and Army Aviation. The Inspectorates' functions are advisory and administrative, the Divisions' executive.

The *Carabinieri*, which for day-to-day purposes comes under the control of the Minister of the Interior, is legally part of the army and its head, a serving lieutenant-general, is chosen from any branch of the army other than the *Carabinieri*. Those of its units integrated in army formations come under the orders of the formation commander.

The Chief of the Defence General Staff has his own staff within the Ministry of Defence which oversees joint defence policy and training; to him is also answerable the Chairman of the Technical and Scientific Defence Council, which carries out research and development for the Italian armed forces and allocates the research budget (on average \$33,000,000 annually) between projects.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

As a result of the armistice of September, 1943 Italy became a co-belligerent of the Western Allies in the war against Germany (and Mussolini's rump State, the Italian Social Republic). It was not therefore disarmed at the end of the war but restrictions were laid on the size and equipment of its armed forces. In 1949 Italy became a founding member of NATO, and in 1951, at her insistence, the restrictions on the size of her armed forces were lifted by the Western Allies (against Russian protests) but that on her possessing nuclear weapons was left in force. Italy thus became a full military member of NATO, committed to building her land forces up to a strength of 12 divisions (a figure which has not been reached and has probably been tacitly abandoned). The exact purpose of an army of this size has never, however, been explicitly defined as a result of 'the fear successive governments have had of losing their precarious majorities by entering into open debate on defence policy. The Soviet Union and the Warsaw Pact are thus never mentioned by name as representing a threat in official government statements. Italy has never published a Defence White Paper and the Five-Year Plan of 1971 made no mention of defence whatsoever'. Nevertheless the Italian Foreign Ministry has stated that the main role of the army, in collaboration with NATO, is 'the defence of the north-eastern frontier, air defence of the national territory' (in conjunction with the air force) and 'internal defence of the national territory. . . . In the general field of internal defence, the *Carabinieri* Corps, which is already responsible in peacetime — with the other armed corps of the State — for the general internal security of the nation, has a particularly important role.'

Commitment

The whole of the Italian Field Army (see Organisation) is committed to NATO; in the event of war, so too would be the Territorial Army and the military units of the *Carabinieri*. One *Alpini* battalion forms part of NATO's ACE Mobile Force. No Italian forces are stationed outside national territory but some American servicemen are stationed in Italy under NATO arrangements: the staff at AFSOUTH (Allied Forces Southern Europe) at Bagnoli, near Naples; the troops of SETAF (South European Task Force), which man two Sergeant battalions at Vicenza and Verona; the 8th Logistical Command at Leghorn; and small air- and shore-based naval detachments.

Deployment

The bulk of the Italian Field Army is deployed on the frontier with Yugoslavia. Territorially, Italy is divided into six military regions (*Regione Militare*); North-West, North-East, Emilia-Tuscany, Central (including Sardinia), South and Sicily. These are further subdivided in 21 zones (*Zona Militare*) corresponding almost exactly with the 20 civil regions, and 65 military districts (*Distretto Militare*) which correspond with one or more of the 92 civil provinces. The regions are responsible for recruitment, internal security and mobilisation. Operationally, the army is divided into three corps (*Corpo d'Armata*) and five territorial commands (*Comando Territoriale*); the latter are situated in the four southern military regions and have few operational troops under their command (See Organisation) — the four Territorial infantry brigades and the *Granatiere di Sardegna* division at Rome (though the latter belongs to the Field Army and is assigned to NATO). The three corps are located in the two northern military regions: III Corps (HQ Milan) controls the *Centauro* armoured division (Novara/Civitavecchia), *Legnano* infantry division (Bergamo), *Cremona* infantry division (Turin) and *Taurinese* alpine brigade (Turin); IV Corps (HQ Bolzano) controls three alpine brigades — *Orobica* (Bolzano), *Tridentina* (Bressanone) and *Cadore* (Belluno); V Corps (HQ Vittorio Veneto) controls the *Ariete* armoured division (Pordenone), the independent armoured brigade *Pozzuolo del Friuli* (Gorizia), the *Julia* alpine brigade (Cividale), the missile brigade (Portogruaro), the *Lagunari* amphibious brigade (Venice), and the infantry divisions *Mantova* (Udine) and *Folgore* (Treviso); the *Folgore* parachute brigade, based at Pisa under *Comando Territoriale VII*, also belongs to the Field Army. There is a battlegroup of the Field Army, consisting of an infantry regiment and an artillery battalion, at Trieste.

The *Carabinieri*, like the army, has both an operational (mobile) and territorial organisation. Territorially, it is organised into three divisions (Milan, Rome and Naples), which control nine brigades (Turin, Milan, Padua, Bologna, Florence, Rome, Naples, Bari and Palermo) which in turn control 24 legions, subdivided into provincial groups. The mobile organisation consists of three infantry regiments of 11 battalions, a parachute battalion (which forms part of the *Folgore* brigade) and an armoured regiment, based at Rome.

Recent Operations

The Italian army has engaged in no operations (except for disaster relief) since World War II. The Public Security Police, and to a lesser extent the *Carabinieri*, have, however, been frequently involved in the suppression of internal disorder (as at Reggio Calabria in 1970) and terrorism, both of the right and left, and also in the control of banditry, which is still endemic in Sardinia and has not altogether died out in Sicily.

ORGANISATION

Arms of Service

There are eight: (1) armoured cavalry (*Cavalleria*), (2) artillery (*Artiglieria*) which is divided into field (*da Campagne*), medium (*Pesante Campale*), armoured (*Corazzata*) and horse (*a Cavallo*), (3) engineers (*Genio*), (4) signals (*Trasmissioni*), (5) army air corps (*Aviazione Leggera del' Esercito*), (6) transport (*Automobilisti*), (7) logistics (*Commissariat*) which includes the medical and veterinary services, and supply, repair, administration and works, and (8) infantry (*Fanteria*) which is divided into infantry of the line (*de Linea*), grenadiers (*Granatieri di Sardegna*), mountain (*Alpini*), light (*Bersaglieri*), parachute (*Paracadutisti*), amphibious (*Lagunari*) and armoured (*Carristi*). The *Carristi* are really armoured troops, providing the tank crews of the armoured regiments; the *Bersaglieri* provide the armoured infantry of the armoured divisions and brigades; the *Granatieri di Sardegna* are permanently based at Rome (and are drawn from the tallest recruits); the *Lagunari* (*Reggimento Lagunari 'Serenissima'*) is based at Venice and equipped for amphibious operations in the lagoons and estuaries of the northern Adriatic; its three battalions are *Marghera*, *Isonzo* and *Piave*. The cavalry have preserved or revived the traditions of the old royal cavalry regiments (*Nizza*, *Piemonte*, *Savoia*, *Genova*, *Novara*, *Aosta*, *Montebello*, *Firenza*, *Saluzzo*, *Monferrato*, *Alessandria*, *Guida*) and provide the reconnaissance battalions of the corps and divisions (except for *Piemonte*, *Genova* and *Novara* which form the independent *Pozzo de Friuli* armoured brigade). A ninth arm of service is the *Carabinieri*, equivalent to the French *Gendarmerie Nationale*, but even more military in character; it provides not only the military police to the army but a whole armoured brigade. Unlike the army, the *Carabinieri* is an all-regular force.

World Armies

Operational

The army is divided into the Field Army (*Esercito di Campagna*) and the Territorial Army (*Forza per la Difesa Interna del Territorio*). The latter, through its five regional commands, exercises authority over recruiting, mobilisation and internal security/territorial defence. It disposes, however, of only four operational formations: the infantry brigades *Friuli* at Florence (*VII Comando Territoriale*), *Pinerolo* at Bari (*X Comando Territoriale*), *Trieste* at Bologna (*VI Comando Territoriale*) and *Aosta* at Palermo in Sicily (*XI Comando Territoriale*). These infantry brigades (*Brigata di Fanteria*) are organised into an infantry regiment of two battalions, a tank battalion (M-47) of two companies, a field artillery regiment of 18 105 mm howitzers, a signals company and an engineer company, and an aviation flight; each of the infantry battalions has an APC company.

The Field Army, forming the Third Army (Designate) — *Comando Designato 3° Armata* — consists of the remaining operational units organised into three corps (III, IV and V) consisting of two armoured and five infantry divisions, one independent armoured brigade, five alpine brigades, one airborne brigade, one amphibious brigade and one missile brigade. The organisation of each of the armoured divisions (*Divisione Corazzata Ariete* and *Centauro*) is: one armoured reconnaissance battalion, one engineer battalion, one aviation flight, one artillery brigade (of three battalions of M-109s, one battalion of M-107s and one Hawk battalion), one signals battalion, and two armoured and one mechanised brigades; the armoured brigades each consist of a signals company, an engineer company, logistic troops, two tank battalions and a mechanised infantry battalion (*Bersaglieri*); the mechanised brigade consists of two *Bersaglieri* battalions, one tank battalion and the same support troops. The independent armoured brigade (*Brigata di Cavalleria Pozzuolo del Friuli*), which provides the tactical reserve to V Corps, is similar in organisation to the divisional armoured brigades but its three battalions, each of three companies, are equipped with a mixture of Leopard tanks and APCs. The infantry divisions (*Divisione di Fanteria Cremona*, *Legnano*, *Folgore*, *Mantova* and *Granatieri di Sardegna*) consist of one reconnaissance battalion, one engineer battalion, one signal battalion, one artillery regiment (of two battalions of 105 mm howitzers, one battalion of 155 mm howitzers and one light anti-aircraft battalion), one aviation flight, one mechanised regiment (of one tank battalion and one APC battalion with an anti-tank company) and two infantry regiments (each of three battalions and one company of 120 mm mortars; one of the battalions in each regiment is to be motorised). The alpine brigades (*Brigata Alpina Taurinese*, *Orobica*, *Tridentina*, *Cadore* and *Julia*) consist of one signals company, one engineer company, one aviation flight, one parachute platoon, one mountain artillery regiment (of three battalions of 105 mm howitzers and one battalion of 155 mm howitzers) and a mountain infantry (*Alpini*) regiment (of three to four battalions, together with an APC company); all the troops of the brigades are mountain-trained and the supply columns contain mules. The parachute (*Paracadutisti*) brigade *Folgore* consists of one engineer company and one signal company, one aviation flight, one artillery battalion (of 18 105 mm howitzers) and a parachute infantry regiment of two battalions (plus a *Carabinieri* battalion); all units are parachutable or air-portable. The amphibious brigade (*Lagunari*) consists of one signal company, one tank battalion and two or three APC battalions, together with its amphibious transport (which is not sufficient to carry all its vehicles). The missile brigade (*Brigata Missili*) deploys two Honest John missile battalions (now obsolescent and to be replaced by Lance and two M-55 203 mm howitzer battalions), all capable of firing nuclear warheads (which are held by the American forces in Italy under dual-key arrangements); it also has an infantry battalion for local protection. The *Carabinieri* fields a number of operational military units, of which the most important are its three mechanised infantry regiments (containing in all 11 battalions), its parachute battalion (serving with the *Folgore* brigade) and its independent armoured regiment (equipped with tanks and APCs) based on Rome; it also provides a company of military police to each corps and division, and a platoon to each brigade.

The organisation of corps troops varies; in general each corps should dispose of one reconnaissance battalion, one tank battalion, one or two engineer battalions, several battalions of heavy artillery, one or more Hawk battalions, and signal and logistic troops, together with an aviation squadron of 10–18 helicopters.

The air force (*Aeronautica Militare Italiana* — AMI) shares the air-defence role with the army and deploys 12 air-defence groups with 96 Nike Hercules SAMs.

The navy has a small marine force: the *San Marco* regiment (1700 strong), and a commando and frogman group; two landing ships with 57 landing craft provide the sea lift for this force.

Paramilitary Forces.

Besides the *Carabinieri* which legally forms part of the army, there exists also a barracked Public Security Police, under the control of the Ministry of the Interior, and 72,000 strong. The Ministry of Finance, one of the three Italian treasury ministries, controls another national police force, 5000 strong — the *Guardia di Finanza* (popularly the *Finanziere*), who combat smuggling. In cases of public disorder, it is the Public Security Police (commonly the *Celere*) who intervene; as a result, they are widely unpopular. The ordinary civil police are the *Vigili Urbani*, organised on a municipal basis.

RECRUITMENT, TRAINING AND RESERVES

Recruitment

The duty of military service is imposed on all fit, male Italians by the Constitution of 1947. The term of service has been,

since 1973, 12 months in the army and air force, and 18 months in the navy from the age of twenty-one. Conscripts provide almost all the private soldiers in the army and a large number of the junior NCOs; they also, if suitably educated, may become reserve officers during their term of service. The right of conscientious objection is now recognised, but few Italians in practice choose to exercise it. Reservists remain on the reserves until forty-five and are recalled for occasional refresher training.

Training

The training of conscripts is carried out in three stages: first, at the *Centro Addestramento Reclute*, which are organised as 11 infantry regiments (13, 28, 46, 48, 52, 60, 80, 84, 89, 152 and 2° Alpini), and where the course lasts 3 months; it includes a course of *Addestramento d'Ardimento* modelled on American Ranger training. The remaining 4 months are spent in platoon training followed by company training. Specialists, after completing the first stage, proceed to the appropriate arms school.

Conscript NCOs are selected from the conscript contingent; those for the combatant arms are trained at NCO schools and then sent as corporals to their units, in which they may be promoted to the rank of reserve sergeant; those for the specialist arms are trained in the schools of their arm.

Conscript officers are selected from those with the high school certificate (*maturita*), undergo 5 months of training at the school of their arm and then proceed to their units with the rank of sergeant; if successful in that rank, they are promoted reserve lieutenant.

Regular Army officers (including those of the *Carabinieri*) are trained at the Military Academy in the Ducal Palace at Modena (in which were merged in 1948 the former Infantry and Cavalry Academy of Modena and the Engineer and Artillery Academy of Turin), where they spend 2 years, before proceeding for another 2 years to the application school of their arm: those of the infantry, cavalry, artillery, engineers and signals have been co-located since 1949 at Turin in the Palace of the Arsenal; the Transport Service School is at Cecchignola, Rome; and the *Carabinieri* School is also at Rome.

Advanced training is given at the Staff College, Civitavecchia, where selected captains undergo a 2 year course; at the Joint General Staff School, Rome, for staff-trained officers of the three services; and at the Centre of Higher Military Studies, Rome, for senior officers and civil servants.

The army maintains a military preparatory school, the *Nunziatella* at Naples, founded by the Bourbons of Sicily in 1787, and now providing a boarding school education for would-be entrants to the Modena Academy.

The schools of the arms and branches are separate from the application schools, which are for officers, and provide specialist training for soldiers of all ranks; they include the infantry, alpine, parachute, mechanised and armoured, artillery, anti-aircraft artillery, engineers, signals, aviation, motorisation, medical, veterinary, quartermaster, and administration schools. The army also maintains a number of technical institutes, particularly for the training of officers of the technical services, as well as foreign language, physical training and equitation schools.

The most important training area of the Italian army is at Capo Teulada, Sardinia, where all armoured training is carried out.

EQUIPMENT AND ARMS INDUSTRY

Lacking domestic raw materials and any large public or private source of investment funds, Italy was slow to industrialise. Under the stimulus of *Risorgimento*, however, a number of Italian families, encouraged by the Piedmont government, set up as large-scale manufacturers, and armaments formed from the outset one of their principal products. Notable among them were the Sicilian Orlando family, which took over the Ansaldo engineering enterprise and made weapons for Garibaldi and his Thousand, and the Breda family, pioneers of railway construction and steel-milling; and they were joined in the 1890s by the Agnelli family, the founders of Fiat and the first large-scale manufacturers of automobiles (and later, in 1915, of aircraft) in the country.

Italian industry was heavily protected by the State from the outset, however, used State subsidies to pay its dividends and suffered very gravely in the slump which followed World War I. It was largely rescued by Mussolini who, through the creation (1933) of a State industrial bank (*Istituto per la Ricostruzione Industriale* — IRI) provided the funds for many private endeavours to stay in business; this was far-sighted, for much Italian technology was original and of high quality.

IRI survived the collapse of Fascism and was taken over by the Republican government, which also inherited other wholly or partly State-owned enterprises and proceeded to apply the IRI principle (purchase of control without outright nationalisation) to other concerns. In order to rationalise its very extensive holdings, the government created in 1956 a new ministry (*Ministero delle Partecipazione Statali*). It now oversees most of the companies involved in armaments or defence-equipment production, with the notable exception of Fiat, which has retained its independence, and some foreign subsidiaries (in some of which it nevertheless has a stake).

Because of early and sustained State intervention, and because also of Mussolini's imperial and military ambitions, Italy has a large and comprehensive armaments industry. She produces military aircraft, naval ships, armoured vehicles and heavy as well as light ordnance, ammunition and propellants and a wide range of electronic and optical equipment. The

World Armies

most important firms producing weapons or equipment for the army are: Fiat (Turin), tanks and cross-country vehicles; OTO Melara (La Spezia), armoured vehicles, missile launchers and artillery pieces; Costruzione Aeronautiche Giovanni Augusta (a Bell associate), helicopters; SIAI Marchetti (Sesto Calende), helicopters and light aircraft; Whitehead Moto Fides (Leghorn), small arms; SNIA Viscosa (Colleferro), ammunition and propellants; SNIA Viscosa's subsidiary SIGME, surface-to-surface and anti-tank missiles; Breda (Brescia), anti-tank missiles and anti-aircraft guns; Contraves Italiana (Rome — an Oerlikon subsidiary), fire-control systems; SISTEL (Rome — a jointly owned subsidiary of Montecatini Edison, Contraves, Fiat, IRI's Finmeccanica and SNIA Viscosa), anti-aircraft missiles; Officine Galileo (Florence, Milan and La Spezia), fire-control systems and optics; OMI (Rome), optics and photogrammetric equipment; Montedel (Montecatini—Edison Elettronica) Elmer Division (Rome), radio equipment; and Beretta (Gardone-val Trompia), small arms.

Equipment

Pistol: 9mm Beretta M51

Sub-machine-gun: 9mm Beretta MAB 38/49

Rifle: 7.62mm BM 59

Machine-gun: MG 42/59 (Motofides, under licence from Rheinmetall — see Germany)

Mortars: 81mm (OTO Melara) and 120mm Hotchkiss-Brandt (OTO Melara — see France)

Anti-armour weapons: 3.5mm rocket launcher (USA); 106mm recoilless rifle M40 (USA); Cobra wire-guided missile (SIGME — see Germany); Mosquito wire-guided missile (Contraves — see Switzerland); and SS 11 wire-guided missile (Aerospatiale — see France)

Air-defence: Indigo missile (SISTEL), Hawk missile and Bofors 40/60 and 40/70 40mm guns

Artillery: 105/14 Model 56 pack howitzer (OTO Melara; equips the field artillery battalions of the infantry, alpine and parachute formations); M-109 155 mm SP howitzer (USA; equips the artillery of the armoured formations); M-59 155 mm gun (USA; equips the medium battalions of the infantry formations); M-107 175 mm gun (USA; equips the gun battalions of the corps artillery); M-55 203 mm howitzer (USA; equips the gun battalions of the corps artillery and missile brigade. (About 1500 artillery pieces of all calibres in service.)

Missile: Lance (USA; equips the missile battalions of the missile brigade)

Armoured vehicles: M-113 APC (OTO Melara — see USA; equips the armoured infantry battalions of the army and *Carabinieri*; about 3600 in service). Equipping the army and *Carabinieri* tank battalions are the following: M-47 (OTO Melara — see USA; about 700 in service); M-60 (OTO Malera — see USA; about 200 in service); Leopard 2 (see Germany; 200 in service); and Leopard 3 (OTO Melara, Fiat and Lancia — see Germany; about 600 built or building)

Aircraft: equipping the brigade, divisional and corps light aviation are: A total of 150 Piper L18 and Cessna 01E Bird Dog light aircraft; 100 Agusta-Bell AB-47 helicopters; AB-206 A1 helicopters (coming into service); and a total of 130 AB-104 A1 helicopters and AB-205 A1 helicopters. Equipping the corps aviation squadrons are 26 Boeing-Vertol Chinook helicopters

Much Italian equipment is obsolete or obsolescent, particularly in the anti-armour and air-defence fields, but there are modern models of many items of equipment under development or under consideration for purchase from abroad: the German-British-Italian FH 70 155 mm howitzer; the *Sparviero* anti-tank missile (under development by Breda and Officine Galileo); the self-propelled SP 70 howitzer (also a German-British-Italian project based on the FH 70); the RS 80 multiple rocket launcher (German-British-Italian); the BR 51 GS multiple rocket launcher (Breda); the Spada low-level air-defence system (Selenia); the American TOW anti-tank missile (now coming into service); and the Folgore unguided anti-tank missile (Breda/SNIA), under development.

Italian equipment difficulties are certainly not the result of technical backwardness. Italy's success in marketing abroad the 105 mm pack howitzer and in re-engineering the M-109 self-propelled howitzer demonstrate the forwardness of her ordnance industry. Her electronics industry is capable of producing a wide range of systems of the most advanced design and her aerospace and automotive industries of innovating or manufacturing under licence equipment of the first quality. Deficiencies in her arms industry have economic, and particularly budgetary, causes. If the Ministry of Defence succeeds in its stated aim of shifting the balance of defence expenditure away from personnel costs towards equipment procurement, there is no reason why the Italian army should not, in the 1980s, become one of the best-equipped in western Europe.

RANK, DRESS AND DISTINCTIONS

Rank

Generale di Corpo d'Armata designato d'Armata (general)

Generale di Corpo d'Armata (lieutenant-general)

Generale di Divisione (major-general)

Generale di Brigata (brigadier)

Four stars on silver-laced shoulder strap

Three stars on silver-laced shoulder strap

Two stars on silver-laced shoulder strap

One star on silver-laced shoulder strap

Colonello (colonel)	Three stars on yellow-edged shoulder strap
Tenente Colonello (lieutenant-colonel)	Two stars on yellow-edged shoulder strap
Maggiore (major)	One star on yellow-edged shoulder strap
Capitano (captain)	Three stars on shoulder strap
Tenente (lieutenant)	Two stars on shoulder strap
Sottotenente (second-lieutenant)	One star on shoulder strap
Aiutante di Battaglia	Three gold and two red stripes on shoulder strap
Maresciallo Maggiore	Three gold stripes on shoulder strap
Maresciallo Capo	Two gold stripes on shoulder strap
Maresciallo Ordinare	One gold stripe on shoulder strap
Sergente Maggiore	One thick chevron and two thin yellow chevrons
Sergente	One thick chevron and one thin yellow chevron
Caporal Maggiore	One thick chevron and two thin brown chevrons
Caporal	One thick chevron and one thin brown chevron
Soldato Scelto	One thick chevron
Soldato	—

Note: stars are silver; chevrons are worn on the upper arm.

Dress

The army has three main orders of dress, a khaki walking-out dress similar to the British (*Uniforme Ordinaria*), an every-day uniform almost identical to British battledress of World War II (*Uniforme di Servizio*) and a very boldly mottled camouflage combat dress (*Uniforme da Combattimento*). The steel helmet is of the same pattern as worn before and during World War II. A variety of other headdress is worn: a black beret by armoured troops, a crimson beret by parachutists, a khaki beret by the *Granatieri*; the *Alpini* wear a felt hat decorated with an eagle's feather and the *Bersaglieri* wear their famous drooping bush of black cock's feathers on a leather hat (and on their steel helmets). All except the *Alpini* may also wear a khaki peaked cap.

Badges of different design and collar patches of different colours are also worn, distinguishing the corps, the different branches of the infantry and the regiments of cavalry. On parade, officers carry swords and wear a pale blue sash over the right shoulder.

The *Carabinieri* wear in everyday dress a white pouch-belt, and on ceremonial occasions a blue tailed coat and bicorn hat of early nineteenth century design.

Italian units carry as the colour the national tricolour: green, white and red, on a pike, to which a pale blue 'cravat' bearing the unit's name and its honours is attached.

CURRENT DEVELOPMENTS

The Italian army is faced at present with three major problems. The first, and least important, concerns its political reliability. Since as far back as 1967, at the time of the so-called Lorenzo affair, the upper echelons of the army have been suspected by the Italian left wing of having plans laid for a *coup d'état*, to be unleashed in the event of the left acceding to power, or even simply to re-establish the neo-fascist party in power again. General De Lorenzo, subsequently Chief of the Army Staff, was in 1964 head of the *Carabinieri* and decided, without reference to the Minister of the Interior, and therefore improperly, to assemble files on persons to be arrested in the event of a political emergency. The total assembled reached 174,000 and, when word was leaked by the press in 1967, the general was dismissed as Chief of Staff and arraigned before a civil court. He was eventually exonerated and remained in public life, becoming first a monarchist and then a neo-fascist deputy, but scandal persisted even after his death in 1973. It was then revealed that a successor, General Miceli, had apparently had foreknowledge of a coup planned by a leading neo-fascist, Prince Borghese, in 1970, which had been called off only at the last moment. Despite the dramatic nature of the allegations and counter-allegations, however, it is unrealistic to regard the Lorenzo-Miceli affair as evidence of the army's involvement in politics. It should be seen rather as a function of the fact that, for historical reasons, two Italian security forces — the *Carabinieri* and the secret service — are administratively branches of the armed forces. In a country with a highly polarised party system and a tradition of violence in politics, the Lorenzo-Miceli affair was almost predictable.

The second major problem concerns the size and efficiency of the army. It is now widely accepted in the country that the present size of the army, given the funds available to support it, militates against its efficiency, since far too much is spent on personnel and establishments and very little left — only about 15% — for procurement of new equipment. It has therefore been decided as a first step to reduce the number of men called up for national service, by about 45,000 (from 210,000) annually, to run existing formations at 70% strength and to reduce gradually the number of formations to meet the size of the national service contingents. The aim is to fall from 36 to 24 brigade-size formations, without any reduction in the

World Armies

number of the alpine and parachute brigades (which are admitted to be the best elements of the existing structure and the most popular with the conscripts). At the same time, some of the funds thus released are to be used to attract more regulars, of which there are shortages in both commissioned and non-commissioned ranks.

The army's third problem concerns its role. Though committed *en bloc* to NATO, and forming the largest component of its southern flank forces, the Italian army confronts no Warsaw Pact force, and lacks the mobility to operate *en masse* outside its own territory. At present, it is deployed on the frontier with Yugoslavia and, in the event of an internal crisis in that country, or of an attempt by Russia forcibly to re-integrate Yugoslavia within the Soviet bloc, might find itself, however much against its will and that of the Italian government, drawn into involvement. The prospect, however, is extremely unlikely. A third possibility, though a more distant one, would be the need to defend the northern frontier in the case of a general war in which Yugoslavia was engaged willingly or unwillingly on the Soviet side. In the meantime, therefore, the army's role is limited to that of acting as an ultimate guarantor of Italian sovereignty. Politically, however, it may be seen as having the unusual role of acting as a counterweight to the State's two other armed forces: the Public Security Police of the Ministry of the Interior, and the *Carabinieri* (legally part of the army), operationally also an arm of the Ministry of the Interior. Both are all-regular in composition and authoritarian in spirit, and, though there is tension between them, it may be that the current function of the army — over 40% of whose conscripts are judged to have left-wing views — is to reassure the opposition parties and their supporters of the existence of a 'third force' in the affairs of the State.

JOHN KEEGAN

IVORY COAST*

HISTORY AND INTRODUCTION

The Ivory Coast attained independence in 1960 and has maintained an uninterrupted record of stability and development since then; it has been argued though, that much of the post-independence development has been uneven and appears to benefit the Ivory Coast's former colonial master France as much as the Ivory Coast itself. Certainly very considerable French aid and investment have been placed in the Ivory Coast, whose President, F. Houphouët-Boigny, has been anxious to maintain and strengthen very close links with France. He is known to have a profound distrust both of Marxism and Islam, and a defence treaty with France is the cornerstone of his defence policy. Only very occasionally have suggestions appeared that political criticism of his policies exists. In 1963 over 100 people, including some ministers, were alleged to have been involved in a plot to overthrow the regime. None, however, was executed and many were released speedily as an act of clemency. In 1971 a middle-level military conspiracy was unearthed and seven officers of major, captain and lieutenant rank were sentenced to death. This plot however leaves an overall impression of a motivation of frustration and *ennui* rather than specific political aims.

Strength and Budget

Population: 5,250,000 (approximately)

Armed forces: 4900, of which the navy comprises 250 and the air force 200, with in addition a barrack police gendarmerie of 3000

GNP: \$6,000,000,000 (approximately)

Command and Constitutional Status

Under the President of the Republic there is a civilian Minister for Defence, whereas the Secretary of State for the Interior is a soldier.

The Inspector-General of the Armed Force is General T. Daquin and the Army Chief of Staff is General I. Coulibaly.

The army is generally expected to maintain a low profile.

Role, Commitment, Deployment and Recent Operations

In the early years of independence national defence was seen to be a continuing French commitment, with the Ivory Coast's own small army committed only to internal security. This view has now changed, and some national defence role is seen: in practice this means attention being paid to the Ivory Coast's border with Guinea.

The French 4th Régiment de Marine remains stationed at Port Bouet.

Organisation

The Ivory Coast's army consists of three infantry battalions, a light tank squadron, an artillery battery, an engineer battalion and a reconnaissance company.

Recruitment, Training and Reserves

The army is recruited by selective national service for 6 months.

French training assistance has been present since independence, for many years French officers appearing in command and staff appointments. Use is made of French military schools and establishments; occasionally units are sent to France for training.

Equipment and Arms Industry

All equipment is French. The tank squadron operates five AMX-13 tanks, the reconnaissance company a dozen Panhard

* For general notes on African armies, see Appendix 1.

World Armies

AML H60 and H90 vehicles, and the artillery includes a very few French 105mm howitzers and 120mm mortars. The infantry battalions have 81mm mortars. The army also owns 10 40mm anti-aircraft guns.

The air force possesses no combat aeroplanes, only transport and training machines. It does, however, own six helicopters, five Alouette and three Puma.

Rank, Dress and Distinctions

These follow French patterns, except that peaked caps have replaced the *képi*.

Current Developments

Defence is not viewed very seriously in Abidjan. It is remotely unlikely that any neighbouring territory, even Guinea, would threaten the Ivory Coast while the metropolitan French troops remain. These in turn safeguard the regime and preserve the invested French capital. While this partnership continues, no serious expansion of the army is likely.

L. L. MATHEWS

JAPAN

HISTORY AND INTRODUCTION

Article 9 of the Constitution of Japan, promulgated in November, 1946 runs:

'Aspiring sincerely to an international peace based on justice and order the Japanese people forever renounce war as a sovereign right of the nation and the threat of force as a means of settling international disputes.'

In order to accomplish the aim of the preceding paragraph, land, sea and air forces, as well as other war potential, will never be maintained. The right of belligerency of the State will not be recognised.'

This article, based closely on a similar provision of the Kellogg-Briand Pact of 1928, was included in the Constitution at the insistence of the American military government, which was largely responsible for its drafting, but with the apparently whole-hearted agreement of the Japanese government and people, in whom the experience of a long war of attrition culminating in nuclear attack, had extinguished not only aggressive intent, but also military spirit, altogether.

That this conversion was genuine is all the more remarkable in view of the strongly militaristic character of Japanese history and society. Since the twelfth century Japan had been governed by a military caste which maintained a rigorously feudal regime, interrupted occasionally by civil war between rival factions of *Samurai* — the feudal warriors — and though in the middle of the nineteenth century the political forms cherished by the *Samurai* had been overthrown, the caste itself had remained dominant within the modernised State, not only in its armed forces and government, but also within its burgeoning industrial and commercial life. Moreover, when the military monopoly of the *Samurai* was broken, as it was in the 1870s, by the introduction of conscription, the result was not a dilution of the military spirit of the Japanese but its transfusion, in full strength, to the population as a whole. The first serious engagement of the new European-style army was with the diehard, dispossessed *Samurai* of Satsuma province in 1877, and its victory prompted Yamagata, the government Commander-in-Chief, himself a *Samurai*, to observe that 'the Japanese, whether of the military class or not, originally sprang from the same blood, and when subjected to regular discipline, could scarcely fail to make soldiers worthy of the renowned bravery of their ancestors'. In the war with China (1894-5), and even more in that with Russia (1904-5), the Japanese peasant, who had been denied the 'knightly' right to bear arms until 30 years before, proved that he was a warrior of steadfast bravery, fierce aggressiveness and perfect subordination; more ominously for the Western empires, he also demonstrated that he was the master of modern tactics and of the most advanced weapons.

Despite the military evolution of the Japanese peasantry, however, the *Samurai*, or more particularly the Choshu clan, dominated the armed services until the early 1920s and dictated their ethos. That ethos expected of the State the provision of a special place for the armed forces within its structure — the reservation, for example, of the posts of Minister of War and Minister of the Navy for serving officers, who were each to be nominated by his own service; but it also required of the army and navy total and unquestioning subordination. The navy preserved that spirit to the end of World War II. But from the death in 1922 of Yamagata, the creator of the modern army and head of the Choshu clan, the army began to develop a different, more self-serving and menacing outlook. The composition of the officer corps had already begun to change, to include a growing number of men from the middle and small land-owning class and from the less important *Samurai* clans, or from none at all. They resented the clan favouritism which had determined promotion to that date, and were ready to manoeuvre for influence within the army in a way which would have outraged Yamagata. They were also much affected by feelings of solidarity with the peasantry, whom they knew as neighbours and tenants, and whose living standards suffered a disastrous decline from 1930 onwards. This was particularly true of the peasants of the north, the army's best recruiting ground (as it still is today). Ideas of a 'national socialist' flavour gained ground among these younger officers, even among those of General Staff headquarters; known colloquially as the 'Showa Restoration', this national socialist programme looked forward to the 'restoration' of the fortunes made by the new capitalist class to the Emperor, and of their power by the political parties. Wealth would then be controlled and authority exercised by a military dictatorship acting in his name. Abroad the frontiers of the State were to be extended into the territories of the defunct Chinese and moribund European empires.

These ideas had no prospect of acceptance either by the Emperor or any part of the Japanese establishment, and this fact led gradually to the growth of another and still more revolutionary idea within the ranks of the dissident officers — *gekokujo* — 'the overpowering of seniors by juniors'. As early as 1927 a secret society dedicated to plotting a *coup d'état* had come into existence within the army. The effects of world-wide depression, felt acutely in Japan, against which at its onset the more developed industrial powers brusquely closed their commercial frontiers, and the readiness of the civilian cabinet to co-operate nonetheless in disarmament agreements like the Washington Naval Treaty (judged disadvantageous and patronising by service opinion), strengthened the plotters' resolve. In September, 1931 the command of the Kwantung Army in Manchuria, acting on its own initiative and at the behest of a clique of fairly junior officers on its staff, ordered its units to seize the city of Mukden and subsequently to occupy the rest of the province.

World Armies

The Kwantung Army was present in Manchuria by agreement with the Chinese government, and in order to defend the railway network against the disorders prevalent in warlord China. But what its leaders, prodded by extremist middle-rank officers, had in fact embarked upon was nothing less than the dismemberment of the Chinese State. In 1932 the Kwantung Army advanced into Inner Mongolia and obliged Chiang Kai-shek to create a wide demilitarised zone between Manchuria and Peking, while in the south, at Shanghai, it became embroiled in a full-scale battle for control of the city with his 19th Route Army, which lasted 6 weeks. Fighting was to break out again there in 1937 and also much more extensively in the north, apparently at the behest of a group of colonels in General Staff headquarters in Tokyo who felt that 'the time had come to settle accounts with Chiang'. The campaign developed into an advance up the Yangtse and culminated in the capture of his capital, Nanking. Shortly afterwards the Kwantung Army also became involved in border fighting with the Russians, which was to flare up again in the summer of 1939.

These external conflicts were complemented by a series of violent incidents at home, both between government and army and within the ranks of the army itself, all expressions of a growing and aggressive nationalism uncertain of the outlet it should take. The army itself was divided between two 'schools', the 'Control' and the 'Imperial Way', the former believing in a policy of expansion into China, the latter prepared to risk a renewal of the 1904 struggle with Russia for open mastery of east Asia. In 1936 adherents of the Imperial Way (*Kodo-ha*), in a 'now-or-never' spirit provoked by the court-martial of one of their own for the murder of General Nagata, unleashed a *coup de force* in Tokyo. Nagata, Chief of Officers' Postings and Promotions, was a leading member of the Control school (*Tosei-ha*) and had been bending his energies to the removal of Mazaki, the leading *Kodo-ha* general, at the moment of his murder. But it was less his success in that direction than his general determination to stamp on the *Kodo-ha* and the spirit of the 'Showa Restoration' which provoked its adherents to act. In the early morning of February 26th, units of the First Division, which had been warned for duty in Manchuria because of the *Kodo-ha* influence under which it had come in Tokyo, left their barracks, together with some individual sympathisers in the Imperial Guards Division, and went to the homes of leading members of the government. The prime minister escaped detection, but two former holders of the office were murdered, as was Mazaki's successor. The rebels, in a Japanese version of the *cuartelazo* so popular with the Spanish army in the nineteenth century (and to be practised again in Algeria in the 1960s), then occupied public buildings and barricaded off a sector of central Tokyo. After 4 days, in the expectation of a public trial at which they would publicise their case, the rebels, who numbered only 1500, gave themselves up. In the event they were secretly court-martialled and 13 of the ringleaders, none of whom had held higher rank than captain, were executed, together with the murderer of Nagata and the writer Kita Ikki, the ideologist behind the 'Showa Restoration'.

The incident led to a loss of respect by the population for the army, but not to a loss of its power. For, conscious of the slight, its leaders, now almost exclusively of the *Tosei-ha*, decided that they must repair the damage not by retreating from politics but by strengthening their grip on government. When a new cabinet was formed in the wake of the 'February Incident', its membership was largely dictated by the Minister of War, while its policies were laid down by the high command. They began to re-arm to a full war footing, signed the Anti-Comintern Pact with Hitler and Mussolini (the negotiations were actually carried out by the army, not the foreign office), and in 1937 removed an uncooperative prime minister and replaced him with a general. When his parade-ground manners united the diet against him the army accepted a civilian premier, but only because they recognised that in him, Prince Konoye, they had a supporter of their nationalist outlook. Konoye was not an aggressive imperialist, however, and attempted to moderate the army's resumed policy of expansion into China, but without success. In July, 1937 fighting broke out with Chiang's troops round Peking, and in August around Shanghai, where an American and a British naval ship were hit and Chiang's troops driven from Nanking, in which city atrocities were committed by the reservists called up for the campaign. Japan's international position was restored only by abject and public apology. The army's determination to press on into China, even at the expense of renewed conflict with Russia, remained nevertheless unshaken. There was a Russo-Japanese battle in Manchuria in the summer of 1938 and a more serious one, on the border of Mongolia, between May and September, 1939 out of which the Japanese came worst. But advances in central and southern China pressed deeper and deeper into Chiang's territory, cancelling out mistakes elsewhere.

The outbreak of World War II, and particularly the signing of the Russo-German non-aggression pact, regarded by the Japanese as a betrayal of the spirit of the Anti-Comintern Pact, brought a moderation of policies. But Hitler's spectacular victories of 1940 stilled the voice of caution. In September Japan signed a new Tripartite Pact with Italy and Germany, and prevailed on Britain and Vichy France to assist in the prosecution of her war with China; Britain agreed to close the Burma Road bringing supplies to Chiang for 6 months, and France to allow Japanese soldiers into northern Indo-China to close the supply route from that direction. In July of the following year, Japan extracted the extra concession of bases in southern Indo-China, and when that move united American and British policy against her in the form of an economic embargo, began seriously to consider a Pacific war. Konoye, who had returned to the premiership after a cautionary resignation in 1939, opposed the prospect with all his strength, but felt himself unable to stand out against the combined contrary opinion of an Imperial Conference held in September. When he attempted to temporise nonetheless, on the grounds that the decision must await the outcome of talks with the Americans in Washington, he was replaced by his own war minister, General Tojo. He was an extreme exponent of the view that time was not on Japan's side and that she must make war at once if her whole position in the Pacific were not to be compromised for good. Against the better judgement of the navy, Japan was thenceforward steered inexorably towards war, which it began with the surprise attack on the American Pacific

Fleet base at Pearl Harbour on December 7th, 1941.

The victories of December, 1941 and of the first 5 months of 1942 were as great as any country has won in any similar span of time, though rarely, perhaps never, over such a wide area. The most spectacular were the work of the navy and the naval air arm, and the land conquests of the Philippines and both the Dutch and British East Indies depended also upon the navy's transport of troops. But the army, if only lightly opposed by the outnumbered Dutch colonial army in the Indies, conducted a brilliant campaign against an equal enemy in Malaya, and one scarcely less noteworthy in Burma. The rapidity of its advance in both countries and the decisiveness of the battles it fought led its enemies to conclude that they had been opposed by a much superior force. This was, however, not the case. For the whole of the opening campaign, the Japanese committed a force of only 11 divisions, and the army which overran Malaya was actually outnumbered by the British defenders. The secret of the Japanese success lay in the high quality of the units engaged, and in the ruthlessness with which they operated. This was directed as much against themselves as the enemy: officers treated their soldiers 'with a severity that would have been thought barbaric even in the Prussian army'* , a practice which helps to explain, if not to excuse, their mistreatment of prisoners-of-war.

After the opening campaigns, the army made no more spectacular advances, in part because most of Japan's territorial ambitions had been satisfied, but more generally because it then came up against the growing force of its enemies' mobilising armies. It needed to keep the greater strength of its army in China, where Chiang carried on the fight against great odds in the interior and was obliged to wage a warfare of attrition or defence in the Pacific islands. Nevertheless, as late as 1944 it was able to find reserves sufficient to mount two major offensives: one against the American airheads in Chiang's territory, the other on the Indian border of Burma which had as its object nothing less than the invasion of Bengal. But its dominance in government, guaranteed by Tojo's occupancy of the premiership, could not be sustained once the steady roll of overseas defeats began to accumulate, as it did from June, 1944 onwards. The loss of Saipan, which gave the Americans a base from which they could bomb Tokyo, in June, 1944 and the failure of the Bengal offensive, led to the fall of Tojo's government. He was replaced by a retired general, Koiso, with a moderate as assistant prime minister. In April, 1945 the Koiso cabinet was replaced by one headed by Admiral Suzuki (who had nearly died of wounds suffered at the hands of the Tokyo mutineers in 1936). He came to power determined to secure some moderation of the allies' policy of unconditional surrender, but otherwise pessimistic of the outcome of the war. The destruction of the centres of Japan's 60 major cities by conventional bombing during the summer of 1945 persuaded almost everyone in government that peace must be made, and the dropping of the atomic bombs in August, that it must be made at once. But to the end the army took an inflexible line. The Minister of War, Anami, argued at the final Supreme Council meeting of the war that Japan should fight on, if only to get better terms, and eventually yielded only to the contrary view of the Emperor himself. He committed ritual suicide on the morning of the Emperor's broadcast announcing the surrender decision to the Japanese people. That same morning, August 15th, a group of officers in Tokyo attempted a final act of 'double patriotism', this time against the Emperor, whose 'real' as opposed to 'declared' will they claimed to represent. Having failed to persuade the commander of the First Guards Division to join them, they shot him dead, forged his signature to give them command of the division and used it to surround the palace which they searched in a vain attempt to find and destroy the recording of the Emperor's surrender broadcast before it could be transmitted.

They were overcome only by the bravery of the general commanding operational headquarters, who at the risk of his life visited the palace and talked the troops over to his side. It was an act which did something, but only a very little, to redeem the conduct of the army over the previous 15 years. 'Making all allowance for exceptions', as one of the most sympathetic of Western historians of Japan, Richard Storry, writes, 'the professional army abused its power by showing itself to be on the whole cruel, arrogant and stupid. Thoughtful, imaginative, politically gifted and sophisticated officers were overshadowed, therefore, by narrow-minded bigots, prisoners of their own *neo-Samurai* mentality. These men . . . brought the good name of Japan into disrepute throughout Asia; and they very nearly destroyed for ever the monarchy and the State they were pledged to serve.'*

Storry's view is one which was widely, perhaps universally, adopted by the Japanese in the aftermath of the war, which was made manifest in the rise of a large-scale pacifist movement and which was given concrete form in Article 9 of the 1946 Constitution. The sincerity of the Japanese people's conversion to anti-militarism has been accepted by observers as widely opposed in ideological viewpoint as General MacArthur, who in 1947 said, 'Japan's spiritual revolution has been probably the greatest the world has ever known . . . I believe sincerely and absolutely that it is here to stay', and the Chinese Communist Foreign Minister Chi Peng-fei, who in 1973 said, 'Unless a country has self-defence power to defend its own sovereignty, its independence cannot be protected. We are opposed to Japanese militarism, but we do not think Japan will permit the revival of militarism and, even if it were to be revived, it would be blocked by the Japanese people'. The principle of anti-militarism is entrenched in the policies of the socialist parties and guaranteed by their blocking minority in the Diet. The constitutionality of the Self-Defence Forces has been questioned from the moment of their creation, and their development (which is described under Command and Constitutional Status) has been opposed by sizable elements of the population at every step since 1954. The Self-Defence Forces are keenly aware both of the legal delicacy of their status and of the mere acquiescence in their existence which Japanese public opinion concedes. The transformation both of the structure of the Japanese state and the attitude of its people since 1945 therefore seems complete.

* Storry, Richard, *A History of Modern Japan*, Penguin, 1960.

World Armies

The influence of the Japanese Army has, nevertheless, continued to persist in a positive form elsewhere. Despite the narrow national self-interest which lay at the core of its anti-European policies preached and practised in east Asia before the war, its espousal of national independence movements and its direct involvement with their leaders has had an important effect on the character of post-war governments in at least three Far Eastern countries: Burma, Indonesia and South Korea. The high command of the armies of each of these countries contains men who were trained by the Japanese army. All three countries are ruled either by soldiers or by soldiers-turned-civilians, who emphasise their belief in an essentially military, anti-party approach to politics. And while none threatens to wage aggressive war, all have made the army the paramount institution in the State, and sought to win popular acceptance of that state of affairs persisting.

STRENGTH AND BUDGET

Population: 114,010,000

Army: 155,000; reserves 39,000

Navy: 40,000; 60 warships (including 15 submarines), 80 smaller craft, 200 aircraft

Air force: 43,000; 364 combat aircraft

GNP (1976 estimate): \$567,000,000,000

Defence expenditure (1977-78): \$6,100,000,000

Japan has consistently maintained defence expenditure at a very low level, both absolutely and as a percentage of the budget and the gross national product. And while expenditure as an absolute figure has increased over the period 1954-74, it has as a percentage declined, from 1.72% and 13.5% in 1954 to 0.83% and 6.39% in 1974. This relative decline is of course partly explained by Japan's enormous economic growth during the period and partly by its comparatively modest equipment purchases.

COMMAND AND CONSTITUTIONAL STATUS

The origins of the Ground Self-Defence Force lie in the National Police Reserve, which General MacArthur, as Supreme Commander for the Allied Powers, authorised the prime minister to create in July, 1951. Its creation was sought by the Japanese government of the day as a means of securing internal law and order, which had been shaken by an abortive general strike in 1947 and by subsequent labour and political disturbances, and it was approved by the Americans apparently because of the denuding of the country of American occupation troops sent to Korea to fight the war there. Thereafter, however, the Americans consistently pushed the Japanese to transform the Police Reserve into a proper army, which could defend the country against external attack. The Japanese hope was that by guaranteeing internal stability themselves they could persuade America to take on permanent responsibility for the external defence of the country. The original Security Treaty of 1951 was therefore a provisional one, since the views of the two parties diverged widely over what the ultimate military status of Japan should be. In the following year the Japanese moved closer to the American point of view by renaming the Police Reserve the National Safety Force, merging it with the Maritime Safety Force and expanding its role to include external self-defence. On that basis a peace treaty and a full security treaty with the United States came into effect in the spring of 1952. In July, 1954 enabling legislation (the Defence Agency Establishment Law and the Self-Defence Forces Law) was put through the Diet which put the Self-Defence Forces on very much the footing which they occupy today.

That legislation vests command of the Self-Defence Forces in the Prime Minister. The Emperor has no connection with them; he has never reviewed Self-Defence Force units or visited their barracks and, in the view of a close observer, 'there is no way that the Self-Defence Forces can officially identify their military service with service to the Emperor'. The Prime Minister exercises command through the Defence Agency, a body which is not a ministry and is directly answerable to the Prime Minister's Office. The Director-General of the Defence Agency is the day-to-day commander of the forces, and he and his two principal assistants must be civilians (one is responsible for parliamentary relations, the other for internal administration). The Director-General, though a politician, is not a cabinet officer in his own right but an official of the Prime Minister's Office. The Ground, Air and Maritime Forces are not headed by commanders but by staffs, the chiefs of which form the Joint Staff Council, the highest uniformed authority in the Agency. In theory, however, its role is purely advisory to the Director-General, and recent expressions of dissatisfaction by senior officers at the constraints on the functions suggest that theory accords with practice.

Defence policy is determined by the National Defence Council, the members of which are the Prime Minister, Deputy Prime Minister, Foreign Minister, Minister of International Trade and Industry, Director-General of the Economic Planning Agency, Director-General of the Science and Technology Agency, the Chairman of the Public Safety Commission, a Counsellor for Intelligence and the Director-General of the Defence Agency. The Council, however, meets rarely and is said by a retired general to be 'an entity in name only'. Decisions in practice are taken by the Prime Minister with the Foreign Minister, Finance Minister, Minister of International Trade and Industry, and the Director-General of the Defence

Agency. Parliament (the Diet) intervenes in defence affairs through a defence committee and by debate on defence expenditure and defence bills. Party lines on defence are, however, inflexibly drawn. Only the ruling Liberal Democratic Party is wholeheartedly committed to the maintenance of the Self-Defence Forces in their present form. The small Democratic Socialist Party is near it in policy, but the Komeito opposes the tie with America which makes the Self-Defence Forces viable, while the Socialists and Communists oppose their existence.

These two parties base their opposition in large part on the doubtful constitutionality of the Self-Defence Forces. This is a complex issue. Article 9 of the Constitution (*see* History and Introduction) indeed appears to forbid the creation of any military force, whether called a self-defence force or anything else. During discussion of the draft Constitution in 1946, however, the then prime minister made it clear that it did not amount to the renunciation of the right of self-defence, only to the means of self-defence. When the National Police Reserve came into existence in 1950, the government argued that its creation was not a violation of Article 9 because the force was not capable of fighting a modern war, and used the same argument to justify the transformation of the reserve into the National Safety Force in 1952 and the Self-Defence Forces in 1954. After that date, as the forces grew in strength and acquired modern equipment, the government shifted its ground slightly, to claim that they did not constitute 'war potential' of the sort forbidden by the treaty, since they were defensive in purpose, and on that ground it has subsequently stood.

Opponents of the self-defence laws have constantly sought, however, to have the constitutionality of the government's policy tested in the courts, particularly the Supreme Court. The Self-Defence Forces have striven, largely successfully, to avoid such a testing, largely by taking care not to give their enemies issues on which to fight: for example, the forces are careful never to requisition land, but always to use land already in government possession. Nevertheless there have been four court reviews of the constitutional issue. In the first, in 1952, the leader of the Socialist Party, Suzuki, took the issue of constitutionality direct to the Supreme Court and asked for a ruling. The court declared itself incompetent, on the grounds that it was not a constitutional court but a final arbiter of cases, and that Suzuki's charge of unconstitutionality was not a case but an abstract issue. In 1959, in the Sunakawa case, it again declared itself incompetent, because the issue turned on a political decision, not a legal point. Demonstrators had protested at their expulsion from an American air base at Sunakawa, arguing that the Security Treaty of 1951, by which it was justified, was unconstitutional under Article 9. The court declared that the treaty was the outcome of a political decision and therefore not a matter for them to judge upon; but it further observed that Article 9 did not deny Japan the right to seek security by treaties with foreign powers, and that the stationing of foreign troops on her soil was accordingly legal. Again in 1962, when two brothers were charged with cutting a military telephone line at Eniwa and pleaded in defence the unconstitutionality of the defence law under which they were charged, the Sapporo District Court avoided a decision in the issue by declaring that the line was not a military one within the meaning of the law. In 1973, however, in the Naganuma case, the same district court, asked to judge the legality of the transfer of a plot of government forest to the Defence Agency, held the transfer illegal on the grounds that the Ministry of Agriculture could not make over land to an unconstitutional body, which it held the Defence Agency to be. The judge went further, by arguing that the Supreme Court's acceptance of 'political decision' as a reason for disqualifying itself from judgement was unsound, since by extension it would rob it of all powers of constitutional review.

The case has been appealed by the government to the higher courts, but the Supreme Court has yet to hand down a final judgement.

ROLE, COMMITMENT, DEPLOYMENT AND RECENT OPERATIONS

Role

The 'Basic National Defence Policy' adopted by the National Defence Council in 1957 laid down the following role for the Self-Defence Forces: to forestall direct and indirect aggression, overcome aggression in the case of its arising, and to defend the peace and independence of the country. To achieve this role, the SDF is dedicated to four policies: (a) support of the activities of the United Nations; (b) promotion of the national welfare and enhancement of the spirit of patriotism, thereby laying a sound basis for national security; (c) the gradual development of an effective defensive power within the bounds of national capabilities to the extent necessary for self-defence; and (d) countering aggression by recourse to the security arrangements with America, pending effective functioning of the United Nations in preventing and repelling aggression. The Self-Defence Forces Law of 1954 also provides for the SDF to assist the civil police in the event of 'indirect aggression' or in other emergency; such help may be ordered by the prime minister (with the retrospective approval of the Diet) or given at the request of a prefectural governor (who must subsequently report his action to the prefectural assembly). Prefectural governors may also, under Article 83 of the Self-Defence Forces Law, request the assistance of the SDF in disaster relief. The SDF has been widely used in disaster relief, but never in a police role, to which there would certainly be wide and strong opposition from the public. There is no national emergency law in Japan.

Commitment

Japan has been a member of the United Nations since 1956 and has had a military alliance (Security Treaty) with the United States since 1951 (revised 1960 and now extended on a year-by-year basis). However, Japan furnishes no military assistance

World Armies

to the United Nations, since the Self-Defence Forces Law forbids troops to be sent out of the country, while the Security Treaty commits America to the defence of Japanese territory, but not vice versa. American air force units are still stationed in Japan, and its ports are used by the American navy, but an exchange of notes appended to the treaty prohibits America from changing without consultation the use of bases or the types of equipment stationed there, and from mounting combat operations from them.

Deployment

The islands of Japan are organised into five army areas: Northern Army (HQ Sapporo) in the island of Hokkaido (nearest the USSR); North-Eastern Army (HQ Sendai) in northern Honshu; Eastern Army (HQ Ichigaya, near Tokyo) in central Honshu and around the capital, Tokyo; Central Army (HQ Itami) in southern Honshu and the island of Shikoku (on which no major formation is based); and Western Army in Kyushu. Of the 13 divisions, four belong to Northern Army — 2nd (Asahigawa), 11th (Makomanai), 5th (Obihiro) and 7th (? the mechanised division; Chitose); two to North-Eastern Army — 9th (Aomori) and 6th (Jinmachi); two to Eastern Army — 12th (Soomagahara) and 1st (Nerima) (both these bases are near Tokyo); three to Central Army — 10th (Moriyama), 3rd (Itami) and 13th (Kaidichi); and two to Western Army — 4th (Fukuoka) and 8th (Kitakumamoto). The 1st Tank Brigade (the only one) is located at Chitose, and the 1st Airborne Brigade (again the only one) at Funabashi, near Tokyo. The largest concentration of troops is therefore opposite the Russian Far Eastern provinces, the Russian island of Sakhalin and the Kurile islands (to the three southernmost of which Japan lays claim); the Air Self-Defence Force is deployed exactly contrarily, with most of its bases west of Tokyo.

Recent Operations

The Ground Self-Defence Force has taken no part in military operations, of either an external or internal sort, since its formation. But, as a matter of policy, the Self-Defence Forces frequently lend help in disaster relief: between 1951 and 1969 they responded to 6600 calls, deploying a total of 3,000,000 personnel. They also share in government civil engineering projects and lend help to farmers: in 1966 58,000 members of the SDF spent some time on duty on the land.

ORGANISATION

Arms of Service

These are infantry, artillery, armour, engineers, ordnance, medical, army aviation, signals, quartermaster corps, transportation and service troops (which include military police, intelligence and other minor corps).

Operational

Organised originally on the American system, Japanese formations were in 1961 put onto a new and smaller establishment: six divisions and four brigades were turned into 13 divisions. These are of three types: A (or *Ko*), B (or *Otsu*) and C (or *Hei*); the latter is a mechanised division. The Type A divisions (2nd, 11th, 6th, 1st, 3rd, 13th and 4th) consist of four infantry regiments, one artillery regiment, one tank battalion, one anti-tank unit, one reconnaissance unit, one engineer battalion, one signal battalion, an ordnance unit, a quartermaster unit, a transport unit, a medical unit, and an aviation unit and service troops. The Type B divisions (5th, 9th, 12th, 10th and 8th) differ only in having three infantry regiments instead of four. The Type C division (probably the 7th) is very similar to the Type B but has self-propelled artillery and a larger allotment of APCs, providing transport for the engineers and signallers as well as the infantry.

The units are small: the infantry 'regiment' is really a battalion of four rifle companies and a heavy mortar company. Thus the total strength of the Type A division is only 9000 and of the Type B and C only 7000; in NATO terms they are really brigades.

Divisions are directly subordinate to an army, each of which is allotted a number of combat units as army troops: all have an engineer brigade, and there are in addition three artillery brigades and three anti-aircraft artillery brigades, as well as a signal brigade, a helicopter brigade and a tank brigade, the latter stationed with the 7th Division in Chitose, Hokkaido.

Each of the three Air-Defence Forces of the Air Self-Defence Force deploys a Missile Group, equipped with Nike-J missiles; the army's own missile air defence consists of seven groups, each with 20 Hawk missiles.

Army aviation consists of 33 squadrons with 360 light aircraft and helicopters; the Air Self-Defence Force has a transport wing of 50 planes which could provide lift for the airborne brigade.

RECRUITMENT, TRAINING AND RESERVES

Recruitment

Recruitment is by voluntary enlistment. It is organised in quarterly 'recruiting drives', carried out by selected members of

the GSDF, who call themselves 'salesmen', and are based on the recruiting offices, one of which has been set up in each of the country's 47 prefectures. Recruiters categorise recruits as 'pure' (those who present themselves) and 'persuaded' (those whom the recruiters approach). In the late 1950s the proportions were about equal; now about 90% are 'persuaded'. Recruiters visit schools and universities, although they are banned by many, and draw up lists of eligible candidates from prefectural records. Candidates are then visited in their homes. The emphasis laid by recruiters in their 'sales talk' is on the personal advantage to the recruit in joining: on the technical training he will receive, which will improve his civilian employment prospects, and on the cash bonus — 100 days' pay after 2 years' service, 150 days' pay after 3 years' service. There is little difficulty in filling the vacancies in the Air and Maritime SDF, but more in finding the 20,000 recruits needed each year by the GSDF (only about 80% are found). Recruiting to the infantry is, as in all armies, the most difficult, and the northern and other rural prefectures (in which the SDF are least unpopular) are over-represented in the infantry, as well as in the army generally.

Recruits are free to leave the SDF at any time during their service, which is initially for 2 years. Recently about 20% have left in the first year, 8% during the second and 30% at the end of 2 years, leaving only 42% who re-enlist. There is a good deal of 'poaching' by industrial firms, chronically short of labour in the post-war boom, which the government attempts to minimise by threatening offenders who enjoy government defence contracts with non-renewal. The rapid turnover of personnel, particularly prevalent among the better educated and skilled recruits, makes the provision of junior NCOs difficult.

Officers are recruited either from school leavers or university graduates; a small number of pre-war officers, who were admitted to the army after a 'depurge' in 1955, remain, chiefly in the upper ranks, and some officers are promoted, via officer candidate school, from the non-commissioned ranks. There are 1200 officer vacancies each year, of which about 95% are filled.

Training

Recruits are trained first in the training brigades (1st with Eastern Army, 2nd with Central, 3rd with Western), then in their units. Specialist training is carried on at the branch schools: anti-aircraft at Chiba City; aviation at Obata, Mie Prefecture; engineer at Katsuta City; signal at Yokosuka City; ordnance at Ami, Ibaraki Prefecture; quartermaster at Matsudo City; transportation at Nerima-ku, Tokyo; service and intelligence, both at Kodaira City; medical at Setagaya-ku, Tokyo; chemical at Omiya City. Later training is carried on in units; the army's main training area, where formation manoeuvres are held, is at the foot of Mount Fuji.

Officers are trained at the tri-service Defence Academy, Yokosuka, near Tokyo (established 1952) for 4 years; the course is of degree level, and the annual army intake is about 300. About 100 officers are commissioned each year from the universities. Subsequent career and staff training is first in the branch school of his arm, and then, if selected, at the Staff College, Shinjuku-ku, Tokyo. Selected officers are later trained at the Joint Services Staff College, or at the National Defence College, both at Tokyo. The command and general staff course at the Staff College lasts 70 weeks.

A Youth Cadet Technical School, Yokosuka, offers technical training to students below military age in return for a promise of enlistment (a means of increasing the supply of scarce technicians, which many volunteer armies practice). Serving members of the GSDF may also be allotted places at civilian prefectural training centres (550 places yearly) which will fit them for future employment. Serving officers used also to take up places in the graduate schools of the universities but have now been banned from doing so under student pressure.

Reserves

Ex-members of the GSDF do not incur a reserve liability (their number is now over 300,000) but a reserve (the Defence Officers Reserve Corps) exists, manned by volunteers, who perform a 5 day annual refresher course and receive generous reserve pay. The reserve may be embodied at the direction of the prime minister. Many of the reservists are not former members of the SDF, but civilians with an interest in military affairs. The GSDF reserve element numbers 39,000.

A number of ex-service associations exist: the SDF Friendship Association (*Jieitai Taiyukai*), a veterans' organisation, the Defence Association (*Boei Kyokai*) and the SDF Co-operation Association (*Jieitai Kyoryokukai*), which foster support for the SDF, and the SDF Parents' Association (*Jieitai Fukeikai*), which concerns itself with the welfare of servicemen.

A proposal by the Speaker of the House of Representatives in 1969 to form a volunteer 'local defence corps' 1,000,000 strong aroused predictable public outcry and was referred to the Liberal Democratic Party's security committee, which has not reported.

EQUIPMENT AND ARMS INDUSTRY

Despite the tepidity of popular attitudes to the Self-Defence Forces, the government has not sought to equip them from foreign sources, but has, through Japanese domestic industry, developed and produced an almost complete range of the most modern material, including ships and aircraft. The only categories not domestically produced are artillery, though it

World Armies

easily might be, and high-performance strike aircraft. But there is a growing demand from within the defence industry to make the American Phantom the last imported aircraft, which would be well within its capabilities: it already produces a supersonic trainer, the T-2. Japan is one of only eight countries to design, develop and produce its own tanks. It also designs and produces APCs, an anti-armour missile and a full range of small arms. It is self-sufficient in most types of munitions (though reserve stocks, officially computed at 2 months' worth, are believed to be much lower).

The government budgets for defence procurement over a 5 year period in what are known as Defence Build-up Plans. The Fourth (1972-6) is still in force. It had as its object for the Ground Self-Defence Force the procurement of 280 additional tanks (including 160 of the new Type 74), 170 additional APCs (including 136 of the new Type 73), 90 SP guns and 154 helicopters. Research on the new types is the responsibility of the Technical Research and Development Institute of the Defence Agency (established 1952), and procurement that of the Central Procurement Office. All equipment, however, is privately produced, the most important suppliers being, in order of importance, Mitsubishi Heavy Industries, Kawasaki Heavy Industries, Fuji Heavy Industries, Ishikawajima-Harima Heavy Industries, Nissan Motors, Mitsubishi Electric, Japan Electric, Tokyo Shibaura Electric, Hitachi Works and Shin Meiwa Industries.

An important element in the defence procurement and production system is the Defence Production Committee of *Keidanren* (Federation of Economic Organisations). Most large industrial enterprises are members of *Keidanren* and the DPC acts both as a negotiating body with the Defence Agency for firms producing defence equipment, and as a co-ordinating instrument between those firms. Its functions seem to be both the dissemination of defence information and the limitation of competition by agreement between interested enterprises. Despite its efforts, defence contracts appear to be generally unprofitable for Japanese industry.

Pistol: 0.45 in Browning (USA)

Sub-machine-gun: 0.45 in M-3 (USA) and 9 mm SCK (Shin Chuo Kogyo, Tokyo)

Rifle: 7.62 mm Type 64 (Howa Machinery Company)

Machine-gun: 7.62 mm Type 62 (Nittoku Metal Industries)

Mortars: 60 mm M-19 (USA), 81 mm M-29 (USA) and 107 mm M-30 (USA; 550 in service)

Anti-armour weapons: 57 mm M-18 recoilless rifle (USA), 75 mm M-20 recoilless rifle (USA), 90 mm M-67 recoilless rifle (USA), 106 mm M-40 recoilless rifle (USA; some on Japanese Type 60 tracked carriers) and Type 64 guided missile (KAM-3D; Kawasaki)

Air-defence weapons: 35 mm L/90 twin gun (Switzerland), 40 mm L/60 and 70 gun (Sweden-USA), 75 mm M-51 gun (USA), Hawk missile (USA; 190 in service) and Nike-J (six Groups in Air Self-Defence Force; USA)

Artillery: M-2 105 mm howitzer (USA; 360 in service; equips the field artillery battalions of the divisions); M-52 105 mm SP howitzer (USA; 30 in service; equips the field artillery of the mechanised division); M-1 155 mm howitzer (USA; 220 in service; equips the medium artillery of the divisions); M-44 155 mm SP howitzer (USA; 10 in service; equips the medium artillery of the mechanised division). Equipping the independent artillery brigade/groups are the M-2 155 mm gun (USA), M-115 203 mm howitzer (USA) and Type 30 300 mm free-flight rocket (Nissan) (some 155 mm M-1 howitzers are probably also in these formations)

Armour: Type 60 APC (eight men plus two crew; Mitsubishi and Komatsu; 430 in service; equips the battalions of the mechanised division); Type 73 APC (10 men plus two crew; Mitsubishi; 70 in service; equips the battalions of the mechanised division); M-41 light tank (USA; 130 in service; equips the divisional reconnaissance units); Type 61 medium tank (35 tons, 90 mm gun, four man crew; Mitsubishi; 560 in service; equips the tank battalion in the division); Type 74 medium tank (38 tons, 105 mm gun, four man crew; Mitsubishi; 150 in service; equips the tank battalion of the division)

Aircraft: 60 transport and communications aircraft in service, including the LM-1 (Fuji) and LR-1 (Mitsubishi); 270 helicopters, including 49 Vertol-107s and 83 UH-1Bs. All aircraft and helicopters are made in Japan, American models under licence by Kawasaki, Fuji or Mitsubishi.

RANK, DRESS AND DISTINCTIONS

Rank

General	Four large stars
Lieutenant-general	Three large stars
Major-general	Two large stars
Colonel	Three small stars, two bars
Lieutenant-colonel	Two small stars, two bars
Major	One small star, two bars
Captain	Three small stars, one bar
Lieutenant	Two small stars, one bar
Second-lieutenant	One small star, one bar

Non-commissioned officer 1	Three stripes, one star on shoulder strap
Non-commissioned officer 2	Two stripes, one star on shoulder strap
Non-commissioned officer 3	One stripe, one star on shoulder strap
Non-commissioned officer 4	Three chevrons, one star
Non-commissioned officer 5	Two chevrons, one star
Non-commissioned officer 6	One chevron, one star

Officers' badges of rank are worn on the shoulder strap, NCOs' chevrons on the sleeve.

Dress

Both the service and the combat dress worn by the Ground Self-Defence Force are American in style. The American helmet is worn. Arms of service wear distinctive colours as piping: infantry, red; artillery, yellow; armour, orange; engineers, violet; ordnance, light green; medical, green; army aviation, light blue; signals, blue; quartermaster, brown; transportation, dark violet; others, dark blue. Members of the airborne brigade wear white piping. The cap badge insignia displays the dove of peace.

CURRENT DEVELOPMENTS

The Self-Defence Forces came into existence at the wish of the Americans, who were anxious to relieve themselves of the burden of Japanese defence in principle and all the more so when obliged to fight the Korean war. Reluctant though it was to agree, the Japanese government of the time acceded to American wishes because it believed in so doing that it could persuade the Americans to guarantee the external defence of the country. The Ground Self-Defence Force, though equipped with the full inventory of modern weapons, was designed to offer no more than the show of conventional defence, and to be objectively capable only of maintaining internal security — without the guarantee of which America could not be counted upon to maintain bases on Japanese soil.

The maintenance of internal law and order remains the principal role of the Ground Self-Defence Force, as the pattern of stationing of its units reveals. Although four are deployed in Hokkaido, the island nearest to Soviet territory from which the most likely external threat would be offered, the remaining nine are stationed close to Japan's major population centres. The quality and quantity of Japanese equipment, in particular its obsolescent artillery and small number of armoured vehicles, reinforces this view. However, despite a persistent strain of violence in Japanese street politics, and the operations of a number of small left- and right-wing terrorist groups, law and order are generally respected by the Japanese, and no outbreak of violence has exceeded the powers of the police to contain it. The army has not therefore been called upon to intervene in civil affairs, and such intervention would be so deeply offensive to the Japanese electorate that no government would lightly contemplate ordering it.

The withdrawal of American troops from South Korea, which the Carter administration has announced it plans to begin, may oblige the Japanese government to reconsider its defence policies. There has already been consideration given to a redeployment of divisions into the south of the islands, nearest Korea, and, if it is decided that a threat to Japan could develop from that direction, re-equipment of the Ground Self-Defence Force with modern weapons may become necessary. The cost could certainly be afforded, since defence expenditures are low both absolutely and relatively. But the political price might be a high one to pay in a country whose public seems to have undergone a lasting anti-militarist conversion.

JOHN KEEGAN

JORDAN

HISTORY AND INTRODUCTION

Jordan has been described as 'an army with a country attached to it'. Jordan has about 2.5% of its population in the armed forces, a proportion matched only by Syria in the Arab world, and amongst the bedouin tribes which comprise the regime's power base and define the country's character the ratio is three or four times higher. It has been estimated that one-quarter of the Jordanian economy depends directly or indirectly on the armed forces, a large part of whose expenditure derives from foreign aid.

It is in the political, psychological and historical fields, however, that the full truth of that statement may be observed. The country owes its sheer existence on the map to Britain's need to reward the bedouin Arab army led by the sons of the Sharif of Mecca which revolted against Ottoman rule in the Hejaz in 1916, and assisted Britain in defeating the Turks in Palestine and Syria at the end of World War I. Of the three independent Arab countries brought into existence in 1920 and ruled by various kings of this Hashemite dynasty, the Hejaz itself was conquered by Saudi Arabia in 1926, and the Hashemite king in Iraq was overthrown in 1958, but Transjordan, under its post-1948 name of Jordan, is still ruled by a Hashemite king.

Prior to 1948 the Kingdom of Transjordan, though containing a substantial sedentary population on the east bank of the Jordan River, was primarily a desert realm, the majority of whose population belonged to nomadic bedouin tribes closely linked with those of the northern Hejaz. (Indeed, some of the tribes had actually accompanied the Hashemite drive from the Hejaz.) In these circumstances, and with financial assistance from the British protecting power, it proved relatively easy for the new monarchy to establish itself and to create a system of tribal loyalties underpinning the regime similar to that which prevailed in the Hejaz. A miniature army was created in 1920-21, consisting at first of five officers, 75 mounted riflemen and 25 mounted machine-gunners for the purpose of maintaining internal order. By 1926 it had grown to 1600 men, and then gradually fell to a strength of 1200 in 1942. In Arabic it was known as the Arab Army (Al Jaysh al Arabi), perpetuating the title of the force led by the Hashemites against the Turks in World War I, but it was generally rendered in English as the Arab Legion.

The Arab Legion was officered, trained and paid for by Great Britain, but its troops were all Arabs drawn from the desert tribes. It grew into an effective, professional force, and performed well in World War II, fighting alongside British imperial forces in suppressing an Iraqi nationalist uprising in 1941 and in the invasion of Syria to evict Vichy forces the following year. At the end of the war it had risen to a strength of 8000 men, but shrank back to 6000 by 1948. When the British mandate over Transjordan was terminated in 1946 a large number of British officers remained behind on contract including the Legion's famous commander, Glubb Pasha, but measures were taken for the gradual replacement of these expatriates by Arab officers.

Although it had never been intended that the Arab Legion should fight an independent war and it lacked reserves of personnel, ammunition and supplies, it fought better than any other Arab force in the Arab-Israeli war that followed the British withdrawal from Palestine in May, 1948. Indeed, it won the only significant victories achieved by any Arab force, and succeeded in keeping almost half of the territory originally allotted to the Palestinian Arabs under the UN partition plan out of Israeli hands. This territory, now known as the West Bank and including the old city of Jerusalem, was subsequently incorporated into the kingdom, which changed its name to Jordan.

However, this annexation drastically altered the population balance of the kingdom by incorporating a majority of better-educated, more-prosperous, town-dwelling, politically aware Palestinian Arabs, who had no traditional allegiance to the monarchy, no tribal structure onto which loyalties could be grafted, and no particular reason to love the Jordanian king. Although the West Bank itself was seized by Israel in the 1967 war, the East Bank of the Jordan now also contains a large majority of Palestinians who have arrived there as waves of refugees from the Israeli conquests of 1948 and 1967.

The consequence has been that Jordan has been transformed from a country of about 500,000 with a clear bedouin majority in 1948 to a country of almost 3,000,000 people with a 2:1 Palestinian majority today. However great the repercussions of 1948 for Jordan in terms of creating an immense burden of expenditure for external defence against Israel, the most important result for the regime has been to turn the bedouin population on which it bases its power into a minority. In the broadest sense, this problem has been solved by basing the regime's power almost exclusively on the army, and recruiting the army almost exclusively from the loyal tribal population.

During the 1948 war the Arab Legion had been quickly expanded to 10,000 men. Faced with the requirements of maintaining internal order in the greatly expanded State and with the strong possibility of renewed war with Israel, the government continued this rapid expansion with British assistance and subsidies. The first armoured formation was created in 1952, and by 1956 the Legion numbered 25,000 men. On March 1st of that year the new king, Husain, dismissed the Legion's British Commander-in-Chief, General Glubb Pasha, and changed its name to the Jordan Arab Army; since

then, it has been a wholly Arab force. At the same time the National Police was separated from it and placed under a Director of Public Security subordinate to the Minister of the Interior.

Insofar as a modern mechanised army requires large numbers of literate and semi-skilled soldiers, who were not to be found amongst the desert-dwelling nomads of central and eastern Jordan, the expansion and modernisation of the armed forces after 1948 created a demand for recruits of a kind who were only to be found in the urban, and most likely Palestinian, section of the population. Thus for the past three decades the armed forces have been torn between two conflicting requirements. Their political preference is for recruiting from the bedouin tribes who automatically gave their loyalty to the Hashemite lineage (which supposedly goes back to the Prophet Muhammad) and from their recently senterised descendants. Their professional need, on the other hand, is to recruit more highly skilled town-dwellers and Palestinians, despite the well-founded suspicion that many if not most of them are fundamentally hostile to the monarchy.

In the first phase of expansion the political danger of recruiting Palestinians was not fully appreciated, and indeed in 1956 the Chief of Staff, Ali Abu Nuwwar, was authorised to create a fourth infantry brigade composed mainly of urban Jordanians and Palestinians. When he attempted to carry out a coup with their support, however, the appropriate lesson was drawn. Further disturbances during 1958 led Husain to request the temporary despatch of a reinforced brigade of British troops and an RAF squadron.
